The Scottish Trials.

WE are glad to be able to announce that the Scottish Trials, the most sporting of all tests, is to be revived this year, and will take place on July 21st-26th inclusive. The decision is apparently somewhat sudden and the time for preparation short, but this is unavoidable, as it is most desirable that trials, which include long distances (approximating 200 miles on certain days), should be held before the evenings begin to close in at all early.

The Scottish Trials have been so popular in the past with every class of rider that, we may be sure, many will make great efforts to have their machines ready and in good trim by the opening day. The regulations will be found elsewhere in this issue, and it will be noticed that the promoters have not thought it necessary to depart, except in occasional small details, from the pre-war conditions or route.

The Scottish Trials are hardly suitable to the butterfly rider, but to the real motor cyclist who uses his machine day by day the whole year round they have in the past proved most enjoyable, and doubtless will do so again, for in spite of the fact that they form so strenuous a test of man and machine, the absence of irksome regulations has caused them to be looked upon by the hardy rider as something in the nature of a joy ride.

What is a Scooter?

NOW that provision is being made for the inclusion of motor scooters in competitions, the need for some official definition which would clearly show the line of demarcation between the scooter and the miniature motor cycle becomes apparent. We contend that the question of accommodation is the easiest and truest point to be considered in this direction. The term "scooter" was applied to the pre-war platform machines by *The Motor Cycle*, because they resembled the pavement toy so popular with the younger generation. A scooter, however small, can no longer be regarded as such if it is provided with a seat. Obviously it is an open-frame miniature motor bicycle; therefore, we think, when the governing body sit to define the scooter, as soon it must, a suitable definition may be arrived at which will meet the views of the majority.

Lightweights in Trial.

ALTHOUGH it is true that lightweight motor cycles have received a certain amount of encouragement in the trials of the past, we think that rather more might be done to aid the development of these little machines and make them more suitable for serious touring. We are not thinking of machines having engines with a capacity in the neighbourhood of 300 c.c. and more: these have long since proved their capabilities for practically any service which may be demanded of them. Rather we have in mind the really small and light machine with an engine capacity of not more than 225 c.c. and weighing about 100 lb., or a little more, completely fitted for the road. Motor cycles of this type are often bought simply as runabouts for use on short journeys only, but, though they are not to be compared with heavier and more powerful mounts in the matters of comfort and speed on long journeys, they are really capable of much more than this.

In the past it has been customary to cut out one or two of the worst hills in a trial in the case of the smaller machines. This policy, carried a little further, would enable a "baby" to compete with success in the A.C.U. Six Days Trials and to prove its usefulness, though perhaps not its equality, to its larger brother. The development and perfection of the spring frame to which, as our readers know, we have given much encouragement, will be another factor in ultimately fitting the lightweight for more serious work than that on which it has been hitherto employed.

THE 1920 CLYNO ON THE ROAD.

A Lengthy Test of the Latest 8 h.p. Sidecar Outfit.

Mr. Frank Smith, with *The Motor Cycle* representative, aboard one of the new 8 h.p. Clyno sidecar outfits.

THE motor cycling fraternity had seen little, if anything, of this post-war production of the Wolverhampton firm until its appearance in the recent London-Edinburgh Trial, when Mr. Hugh Gibson drove it through without mishap, but the interest which it aroused at Highgate and *en route* was evidence that its fame had preceded it.

A member of *The Motor Cycle* staff was able to sample its power and comfort on an extensive trip recently, which was really a preliminary canter for the bigger event on the Great North Road.

The new Clyno was fully described in our issue of February 20th, and it is only necessary to say that very few minor alterations have taken place since. The V twin engine is 76 mm. bore × 102 mm. stroke, giving 925 c.c.; the transmission is by totally enclosed chain through a specially designed three-speed countershaft gear, to a sprung rear wheel; the sidecar wheel is also sprung.

Our journey started from the works at Wolverhampton, and the first fifteen miles were a horrible dream, as regards road surface; if anything worse exists than this road through Walsall to the suburbs of Birmingham, then a tank is the only suitable vehicle to traverse it. Had there been any defects in the springing system this section would have shown them up, without doubt, but it is quite true to say that not one really bad jolt was experienced by passenger or rider; the average speed over this section of the road was about seventeen miles per hour, and fast enough, in all conscience.

The run was continued *via* Dunchurch and Dunstable to London, thence up the North Road to the neighbourhood of York; here we turned south through Derby to Wolverhampton again—a round trip of nearly 400 miles.

Hills are unimportant on the earlier part of this route, and the machine simply hummed along at an even "bat" somewhere around 30 m.p.h. in the smoothest possible manner; it appeared possible to continue indefinitely.

A Comfortable Sidecar.

Both the sidecar passenger and the driver had, in Army parlance, a decidedly "cushy" job. The springing system, coupled with the unusually roomy sidecar, gave comfort, the like of which used to be found only on a good car; it was quite possible to write fairly legibly, and later, during the run, which was continuous over some twenty-two hours, the passenger slept soundly for a time. The almost silent running will satisfy the most fastidious—it may be compared to the ticking of a sewing machine. So pronounced is this point that, when the first change from low to top gear was made, we thought the engine had stopped accidentally.

On the return journey one or two fairly steep hills were encountered in the neighbourhood of Nottingham; on one of these one might quite reasonably expect to change down to second gear with any modern touring outfit. The Clyno took it on top, and, more than that, it was slowed and accelerated again several times with perfect ease; the average speed on this hill, for a little over a quarter of a mile, was about 25 m.p.h. The throttle was never quite fully open, and the load was a good touring standard. It was not an exacting hill, but sufficient to demonstrate the excellent hill-climbing powers of this new Clyno engine.

The Transmission.

More than a passing word in praise is due to the transmission; snatch is entirely absent, the clutch operating very smoothly.

Lubrication occasioned no worries; there are two systems. One is a mechanically-driven pump, forcing oil through a sight feed, and the other is the ordinary plunger pump. They may be used together or apart.

On a run of 400 miles one finds time to pick out faults if they exist, but our chief difficulty seems to be to describe impartially whilst keeping a curb on the superlatives. Without doubt we retain a definite impression of one of the best passenger mounts which will come before the public this year.

Difficulties still lie in the way of the production of this machine in large quantities; it is partly the Clyno company's reward for doing their war aero engine work so well that a considerable portion of their energies is still engaged in this direction: hence the delay in motor cycle work. Progress is improving, and when the fortunate purchasers of the new model take delivery they will, we feel, agree with our restrained eulogy.

OCCASIONAL COMMENTS

BY "IXION"

Pardonable.

IT is not altogether surprising that certain motor firms are unable to supply replacements from stock. When a new model is put on the market, a certain percentage of spare parts in reserve is specified by any decent works manager. To take an imaginary example: he may order 500 cylinders and 5,000 kick-starter pinions to be made and put into store, as a surplus to the quantities required for the output which he has planned for the year. It is, of course, impossible for the complete supply to be in the bins by January 1st of the year in which the new machine is introduced. In practice, the full quantity of several parts may be binned by the end of January, while the output of machines may be retarded or reduced because he cannot procure the production quantity of another part, let alone put aside a surplus for replacement orders. Thus January 31st may see some bins full, whilst December 31st may find other bins still empty. In 1914, many firms introduced new models, or at any rate machines embodying small modifications from previous patterns. War broke out in August, 1914, before the specified stocks of surplus parts could be completed. Since then few factories have had any chance of replenishing empty bins, and the drain upon such stocks of replacements as were completed has been excessive. No rider can, therefore, nourish a very ferocious resentment if his order for a pre-war replacement part elicits a polite apology, plus the information "that we are putting through a further supply of these spares as fast as possible."

Unpardonable.

UNFORTUNATELY, as our correspondence columns indicate, and as private information amply confirms, quite a large number of British factories grudge the small expenditure requisite to pacify customers who are pardonably anxious to get their machines into running order; and the culprits are by no means confined to the back-street, one-machine-per-month type of maker. Here is a case which is not at all extreme. A working man uses his 1914 machine to travel daily to a job seven miles way. Early in April he broke a weak part of his machine; the corresponding parts of sister machines had begun to collapse early in 1914, so that the makers must have been aware that a demand was certain. He put his order for spares through the local agent, and as he was compelled to use a push bicycle over steep, rough roads, great was his glee when the first week in May brought a *pro forma* invoice and a request for cash from the firm concerned. The cash was sent by return. Since that date neither owner nor agent has heard so much as a whisper from the factory, except for an official receipt. Repeated letters, finally culminating in a reply paid wire, have failed to stir the lethargy of this factory. Needless to say, its "goodwill" in that particular district has long since evaporated, and will not easily be regained. As the ancients said, "*Quem Deus vult perdere prius dementat.*" There is no excuse for such conduct. The concern in question is spending hundreds on advertisement. Had it engaged a demobilised adjutant, an ex-Whitehall flapper, and an Hotel Bolo Brownie (to dictate letters, stenograph, and enquire at the storekeeper's respectively), it would have enjoyed an advertisement worth far more than it has spent since the Armistice. In lieu of this, it apparently engaged one clerk to circulate a Roneo-ed letter, "We are putting this in hand right away," and left it at that. It is quite fair to point out that American factories have never been so pushed as to exhaust or mislay their pre-war spares, or even as to leave empty bins unfilled indefinitely; it is also fair to add that no American firm would treat its humblest and most remote customer in such callous and unbusinesslike fashion.

Honourable Exceptions.

FAR be it from me to imply that such misconduct is typical. I know another firm which was caught napping by the war. It was in process of reorganising and rebuilding to meet a sudden boom in its wares, and it possessed neither spares, store room, nor storekeeper. During the war it was swollen by Government demands into a concern of first-class importance; and since its duties were largely of an experimental kind, its growing shops were almost buried under junk and dud and litter of every imaginable kind. Suddenly the war ended. I doubt whether the firm had a hundred motor cycles on the roads of the world, and with its new reputation as an asset, vistas of unimaginable wealth must have opened before the eyes of the three partners. Under such circumstances many men would have washed their hands of the handful of 1914 customers, scattered thinly over two hemispheres. Not a bit of it. The trio met in solemn conclave. "The best advertisement is a contented customer," was the order of the day. One of the three directors was set free to organise a proper spare parts service for those miserable ninety odd 1914 clients, or whatever the exact number was. If he cannot always send you a new engine by return of post, at least you get a graceful explanation, and the guarantee that his men are busy making what you need. That firm is going to rake in the shekels, and deserves them.

The Cheapest Motoring for Two

COMMENTS, WISE AND OTHERWISE, ON THE PRESENT-DAY SIDECAR OUTFIT.

BY "CAR DRIVER."

IT is probable that many motor cyclists owning sidecar outfits may take exception to the wording at the head of this article, and condemn me for either a coward or a heretic in that I state, or at least imply, that a sidecar outfit is a two-seater. It would appear to the observant traveller that, although through some foolish whim of the designer a combination may be, as it were, condemned to bear abroad a mere two, such condemnable niggardliness of mind carries no weight with clients, and that from three upwards is the average number carried on most sidecar outfits.

As a car driver by birth and upbringing, so to speak, I have been reared on the creed of one seat one occupant, but since I have taken to doing my motoring on a sidecar I perceive with all humility how unsociable I have been in the past, and to be in the *mode* I must have a couple of passengers in the body of the sidecar and at least one on what I understand the most highly initiated of the cult term the "flapper bracket."

But to our story.

Being released from the toils of the Army, my first thought was a car. Unfortunately, an intensive study of the markets revealed all makers in possession of a metaphorical queue, yclept a "waiting list," each clamouring its loudest for delivery of the goods. Standing in a queue is ever a waste of time, so I did not.

The Super Second-best.

There remained the second-hand car market, unattractive at all times to my mind. I soon discovered that to pick up a good second-hand car at even twice its apparent value required more time for investigation than could be spared conveniently. There are no second-hands to be bought, I was often told. A small advt. in *The Autocar* brought many replies, but each letter appeared to be written by "Get-rich-quick Wallingford," or a blood relation. The second-hand alternative seemed equally off the map with the new car theory. It was most annoying, for the amiable Messrs. Cox had most obligingly cajoled some three hundred odd of the best out of the reluctant Treasury in the shape of War Gratuity, and it seems a hard world when something on four wheels cannot be acquired for three hundred Bradburys. Something worth while, of course. But no luck anywhere could be found among cars.

However, Easter loomed near and benzole was acquired, but there was nowhere for it to lay its head—no tank, that is. Bright thought, a sidecar! As a matter of fact finding a good sidecar outfit was not the easiest thing in the world, but, put briefly, it was done, and just before Easter I found myself with a very excellent outfit, consisting of a famous single-cylinder machine, and attached to it a sidecar by one of the most eminent members of the sidecar making craft. Since then I have covered close on fifteen hundred miles without an involuntary stop or the need for a single adjustment; therefore I will say right here and now that I consider that, as far as *reliability* goes, a *good* sidecar outfit is equal in the matter of reliability to a motor car.

Evolution.

Now for a few observations. It is some years since I rode motor cycles: years ago, from 1902 onwards, I owned dozens, and accumulated a total mileage of many tens of thousands of miles. So I know something of the ways of the two-wheeler.

I have not ridden a motor cycle since 1913. Since then I have used cars whenever the war has let me.

Frankly, I am astounded at the improvement in the engines of the present day over, say, those of 1912-13: far more power and flexibility, easier starting, and better balance.

Fittings and gadgets generally have vastly improved: the perfecting of electric lighting alone lifts sidecaring from a terror by night to its being a matter of indifference whether daylight is available or not. The almost universal little Klaxon makes one far happier than the horrible old pip-squeaks that formerly went by the name of horns. Mudguarding is better, and is apparently still improving. Transmission details are far stronger and better carried out. General controllability is on a higher plane than before the war.

Chain cases are now perfected.

So far all is to the good.

There is another side to the question

While the passenger is well looked after, the comfort—as opposed to the convenience—of the driver is not any better studied than in 1912. Only a few firms appear to be resolutely tackling the question of rear suspension of the motor bicycle itself.

It seems to me it is too easily said that rear springing renders proper attachment of the sidecar difficult. I

The Cheapest Motoring for Two.—

cannot agree. It has been done, and it can be done, and what is more it *must* be done.

There are, in my opinion, three main problems which must be tackled very quickly. First and foremost the question of springing, second provision of detachable wheels, and third some well-thought-out plan of carrying a reasonable amount of luggage for two on the *sprung* portions of the outfit. There is nothing impossible or unreasonable in such demands. Everyone who sidecars wants these, and when everyone wants anything it is generally obtainable.

One can obtain all the points, and has long been able to obtain them, in the smallest and cheapest cars: I had almost written cycle cars.

I sincerely trust that Olympia will be bristling with outfits so equipped next November.

The Motor Cycle was the power in the land that got us multi-speed gears for motor cycles. Is it too much to hope that it will use its great influence to educate the public to demand and urge the manufacturers to supply sprung rear frames? It ought to be as rare a thing to see a powerful outfit minus rear springing and detachable wheels in 1921 as it is now uncommon to encounter such *necessities*. Really such fitments are due in 1920, but one desires to be reasonable, and to give manufacturers a chance to perfect such devices.

Given such an outfit, I really cannot see that a cycle car of moderate price has much advantage over a sidecar. It has certain disadvantages: it will always cost more to run a four-wheeled vehicle than one with three wheels. The cycle car will lose in hill-climbing, petrol consumption, speed, first cost, taxation, and in difficulties of garaging. But on present-day design, it is a big winner on *comfort*. There is no mechanical reason why it should be so, and as a carist and motor cyclist, I consider I have a right to a great deal more comfort and convenience on a sidecar outfit than I get at the moment.

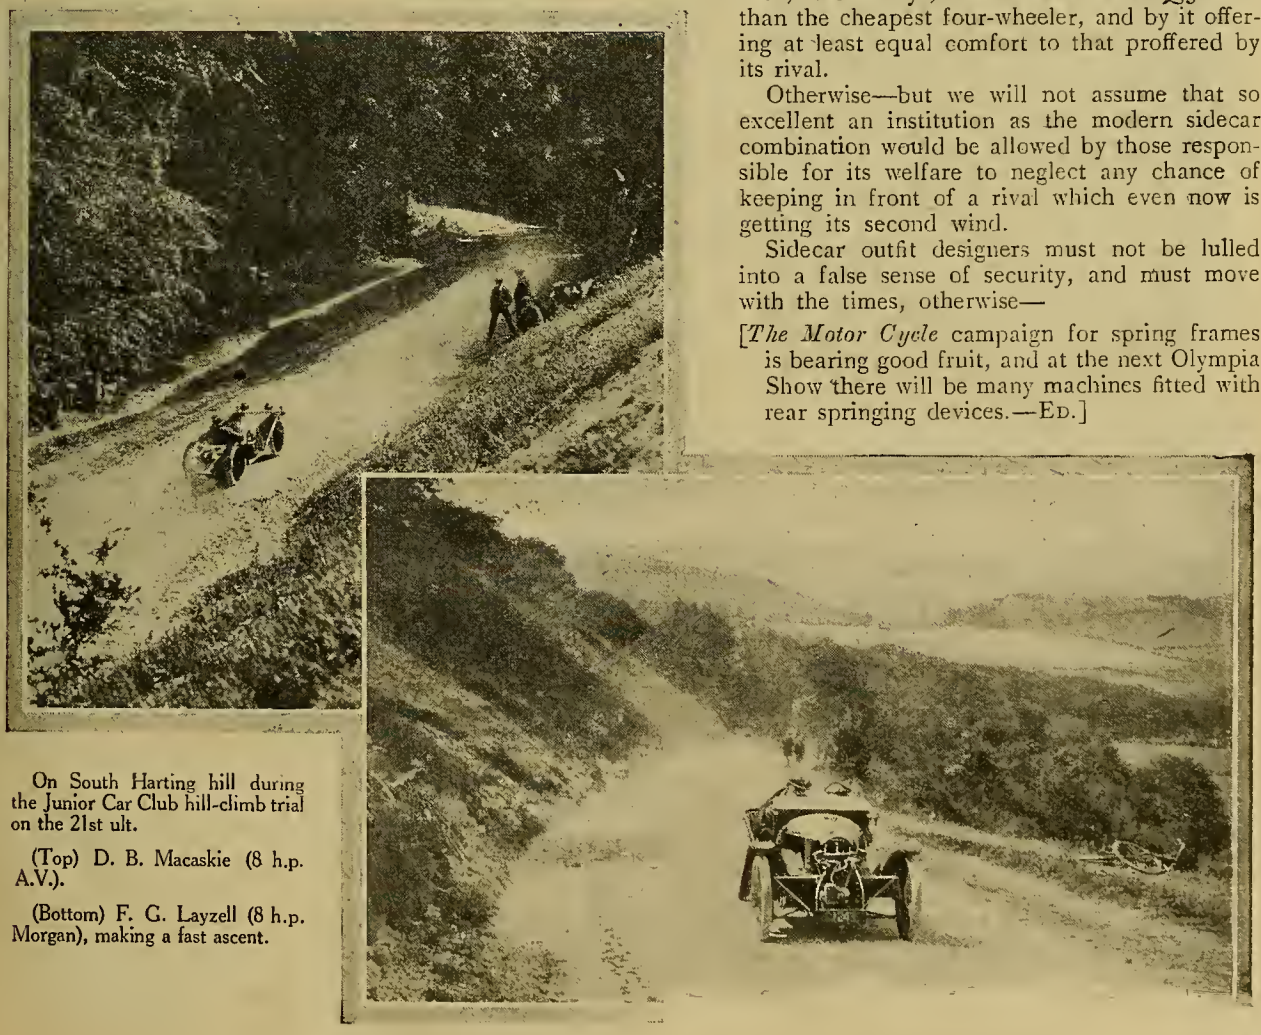
Four Wheels or Three?

It seems possible that manufacturers are living in a rather dangerous time. Before the war, the cycle car attack on the sidecar position, though promising to be formidable, eventually wilted and came to nought. Things have progressed somewhat since that time, and when the cycle cars make their massed attacks on the sidecars next time, they will not be beaten off so easily. What will save the sidecar combination now, then, and always, will be its sale at £50 less than the cheapest four-wheeler, and by it offering at least equal comfort to that proffered by its rival.

Otherwise—but we will not assume that so excellent an institution as the modern sidecar combination would be allowed by those responsible for its welfare to neglect any chance of keeping in front of a rival which even now is getting its second wind.

Sidecar outfit designers must not be lulled into a false sense of security, and must move with the times, otherwise—

[*The Motor Cycle* campaign for spring frames is bearing good fruit, and at the next Olympia Show there will be many machines fitted with rear springing devices.—ED.]



On South Harting hill during the Junior Car Club hill-climb trial on the 21st ult.

THE MOTOR MACHINE GUNS.

An Attractive Service Now Open for Recruits.

IT was quite a happy thought on the part of the individual who invited the Motor Machine Gun Batteries to participate in the Bristol rally. The four companies which paraded on that occasion created a very favourable impression, and we were struck by the very apparent enthusiasm of the men. During the gymkhana, arranged by the Bristol M.C.C., some of the officers and men competed in most of the events, and the *camaraderie* which existed between officers and men was clearly apparent. In the procession, and later in the gymkhana events, great skill was displayed by the drivers, Lt. Bradshaw in particular shining when it came to "stunt" performances.

We understand that this unit has authority, and is prepared, to accept suitable motor cyclist recruits. The corps is recommended to any motor cyclist or would-be-motor cyclist who is at a "loose end" and who would appreciate membership of what is, to all intents and purposes, an up-to-date motor cycle club, with all found and no subscriptions to pay.

Major B. Arthur, D.S.O., informed us that there is a certain amount of light duty, but plenty of leave and liberal pay, a most excellent combination of duty, business, and pleasure. Any aspirants should apply personally to the Headquarter Orderly Room at the White City, Ashton Gate, Bristol.

Maj. B. Arthur, D.S.O., on a military Clyno outfit, passing through the archway entrance of Ashton Court, Clifton, on the occasion of the recent Bristol M.C.C. Rally.

Four companies of the 1st Motor Battalion M.G.C. at Bristol, where they have been stationed since their return from Overseas.

Our readers will recall that *The Motor Cycle* played a prominent part in the formation of the popular Motor Machine Gun Service, obtaining over 10,000 recruits among readers of this journal at a time when their services were urgently wanted. At the present moment batteries of sidecar machine guns are scattered all over the world, doing yeoman service in guarding British interests in our overseas possessions. Regularly our postbag contains letters from these men stationed in the most unexpected—and sometimes unheard of—places. The famous Tank Corps—whose deeds played such a big part in winning the war—was, in the first place, manned largely by motor cyclists drafted from the ranks of the M.M.G.S. Their brave deeds will live in history for all time.

A.C.U. NOTES (Officially Communicated).

PETROL LICENCE REBATE.—Since the removal of restrictions on the sale of petrol, the Auto-Cycle Union has been actively assisting members to obtain the rebate on paid-up licences to which they are now entitled.

MOTOR CYCLE COMPETITORS' CERTIFICATES.—The Auto-Cycle Union desires to impress upon intending competitors in open motor cycle competitions that it is essential for them to obtain the Union's competitor's certificate. Various delays and inconveniences have been caused in connection with recent competitions by riders neglecting to do this. These certificates can be obtained only from the Auto-Cycle Union, 83, Pall Mall, London, S.W.1, and the necessary application forms and particulars regarding them will be forwarded to intending competition riders on request.

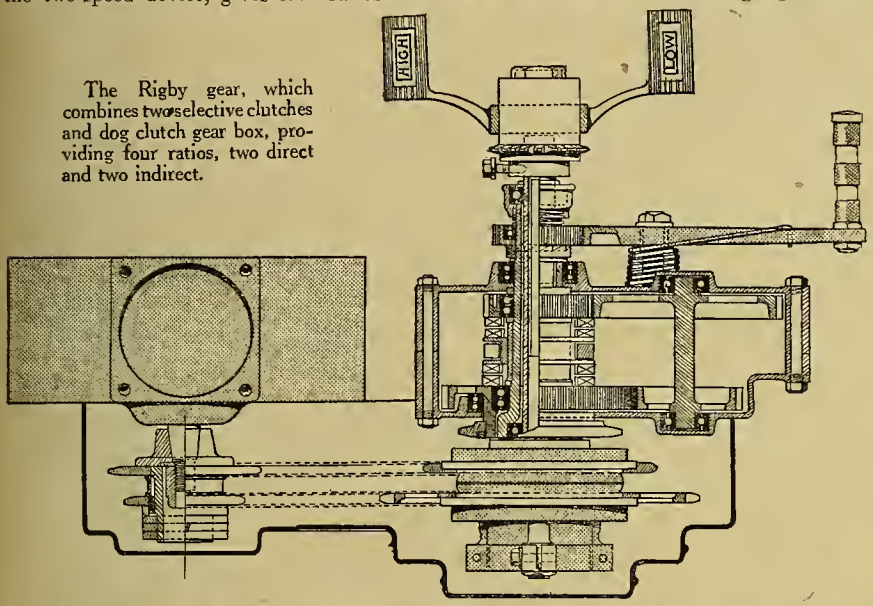
MOTOR CYCLISTS INSURING.—A large number of motor cyclists are insuring themselves and their machines through the special policy prepared for their benefit by the Auto-Cycle Union. This policy is, of course, only issued to A.C.U. members, but it is in itself a sufficient inducement to every thoughtful motor cyclist to join the Union.

A BOOM IN MOTOR CYCLE TOURING.—Motor cycle touring has already surpassed its pre-war popularity. Just before Whitsun the Auto-Cycle Union received an enormous number of requests from members to supply them with routes and other touring information. The A.C.U. Touring Department worked at high pressure in meeting the varied demands made upon it.

BUYING SECOND-HAND MOTOR CYCLES.—Owing to trade exigencies new motor cycles are almost unobtainable at present. This a good many enthusiasts have found to their disappointment, but there has been practical consolation for those who are members of the Auto-Cycle Union. These have taken full advantage of the free technical advice in the purchase of second-hand machines, to which they are entitled, and many prospective riders have had likely purchases examined by the A.C.U. Engineer under the modest scale of charges provided for members.

A SIMPLE FOUR-SPEED GEAR.

IN our issue for May 22nd we illustrated the Rigby selective clutch two-speed gear intended for old-type machines with pedalling gear. The inventor and patentee, Mr. E. J. Rigby, of Prescot Road, St. Helens, Lancs., has designed a modification of this gear, embodying a simple countershaft gear box, which, combined with the two selective clutches of the two-speed device, gives four ratios.



The Rigby gear, which combines two selective clutches and dog clutch gear box, providing four ratios, two direct and two indirect.

The ratios provided are 4, 6, 8, and 11½ to 1, with two neutral positions, and the device allows the pedal starter to be used with the back wheel on the ground.

As will be seen from the illustration, two chains alternatively convey the drive from the engine to the countershaft, providing two ratios equally direct—that is, without driving through the spur gears in the gear box. This latter part of the unit approximates to a conventional dog clutch gear box providing two ratios, therefore, two "indirect" ratios. The top gear is obtained when the inside chain wheel is clutched to the main shaft by depressing the high gear pedal, which moves the dog clutch in the gear box to lock the larger of the two spur wheels on the main shaft. The driving sprocket of the rear chain is connected to this spare wheel, consequently, by clutching it to the main shaft the drive is direct to the rear wheel, the spur gears running idly.

Obviously, if the outside sprocket is clutched to the main shaft (by the low gear pedal) in place of the one on the inside, a second direct ratio is provided; while if the far side gear wheel is connected to the main shaft by the sliding dog clutch, the drive will be from one or the other chain sprocket clutch through the main shaft and two far side gear wheels, hence through the near side spur wheel on the layshaft to the gear on the inside and the small driving sprocket. Thus, four ratios are obtained, the 4 to 1 and 8 to 1 being direct.

To start the engine by the pedal starter the dog clutch in the gear box is placed in the neutral position, as shown in the illustration, and the pinion wheel, meshing with the segment in the starting crank, transmits the motion through the main shaft to whichever of the two chain sprockets is clutched to it.

TWO-SEATER SIDECARS.

GREATER sidecar accommodation has, for a considerable time, been demanded by many motor cyclists with families, and, to meet this call for a second seat, the Venus Sidecar Company, 6 and 8, Gourley Street, S. Tottenham, London, N., have recently introduced several new sidecar designs.

One model, known as "The Tank," is a large and comfortable sidecar with a "square" body somewhat resembling a Tank, which amply accommodates two passengers; one seated in the large front seat, and the other, sufficiently large to seat a juvenile up to fourteen years of age, located at the rear.

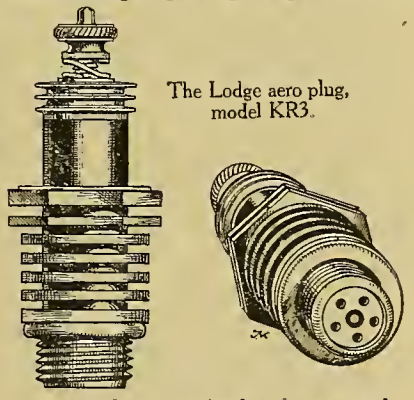
The bulbous two-seater illustrated carries its passengers in the reverse way. The adjustable bucket seat in front of the seat proper is provided at each side with a bracket suspended from bolts on the inside of the car, and is held in position by a folding leg hinged to the underside of the seat. When the seat is not required the whole fitting is rotated forward, providing a comfortable footrest for the passenger in the rear seat. A spacious recess is provided in the back of the sidecar for the storage of a petrol tin or luggage, access to which is given by the hinged backrest.

Another two-seater sidecar is being produced, fitted with a flat seat located in front of the main seat, additional comfort being provided by a backrest.

AIRCRAFT PLUGS.

MANY of our readers have displayed keenness to try the special plugs which were used in the British aircraft engines.

The aircraft plug considered to be in widest use during the war was the Lodge aeroplug (Model KR3), and the makers, Messrs. Lodge Sparking Plug Co., Ltd., of Rugby, have received a large number of applications for them from motor cyclists. Until quite recently, however, Messrs. Lodge were not permitted to supply the plug except through the Air Board; but, we understand, the makers are now released, and a quantity of this model KR3 plug is available for general use at a cost of 8s. 6d. each. The manufacture of the plug is not being proceeded with at the present time, and the plugs offered by the makers are those actually made for use by the R.A.F.



The Lodge aero plug, model KR3.

HOT OR COLD INDUCTION?

THE THEORY OF PETROL CARBURATION.

THERE is one fundamental point in connection with the question of hot induction which I have not yet seen mentioned. I refer to the matter of vapour pressures.

Before going further an explanation of the term might not be amiss. If a small quantity of any pure liquid be introduced into the Torricellian vacuum of a mercurial barometer (I do not recommend playing around with respectable pendant instruments, however), it will be observed that the liquid evaporates and the mercury drops a certain distance. If the addition of liquid be continued, there will come a point at which the mercury level remains stationary despite any further additions. The difference in levels is due to the pressure of the vapour driving the mercury down, and is known as the vapour pressure of the liquid at the temperature of the experiment. If, however, the barometer be heated, it will be observed that the vapour pressure increases, and, if the boiling point be reached, the mercury sinks to the level of the reservoir and the vapour pressure is exactly one atmosphere.

The Significance of the Vapour Pressure.

All this does not seem to have much bearing on petrol engines as yet, but the important point is that the amount of vapour in any closed space that is saturated with it can be found if we know the vapour pressure of the liquid at the particular temperature. It is given by the expression:

$$\frac{\text{Vapour pressure at given temperature}}{\text{Atmospheric pressure at time}} \times 100\%$$

Now, imagine a cylinder saturated with inflammable vapour. A certain percentage of the vapour is essential before we can get an explosion. The percentage actually there can be found from the above expression, provided we know the vapour pressure of the liquid for a number of temperatures. Possibly the cylinder is too cold for the saturated vapour to be explosive: heating the liquid will raise the vapour pressure and raise the percentage of vapour present till it does constitute an explosive mixture. From this it is clearly seen that *the necessity for hot induction in a petrol motor will depend entirely on whether the vapour pressure of the fuel is sufficiently great to yield an explosive mixture with air.*

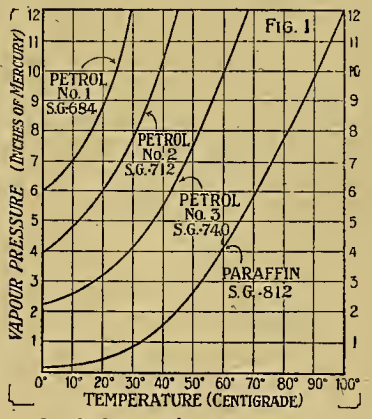

FIG. 1
VAPOUR PRESSURE (INCHES OF MERCURY)
PETROL No. 1 S.G.·684
PETROL No. 2 S.G.·712
PETROL No. 3 S.G.·740
PARAFFIN S.G.·812

TEMPERATURE (CENTIGRADE)

Graph showing the vapour pressures of various fuels.

Having thus stated my case, I trust the reader will forgive my introductory diatribe. Being unable to gain access to any published data on the vapour pressures of various fuels, I had perforce to determine them myself, using standard samples of the fuels quoted. The experiments were carefully done, and, although not academically accurate, are nevertheless sufficiently accurate for the present purpose. Fig. 1 shows the results in graphical form. The wide difference between the three grades of petrol and paraffin is at once apparent.

Explosive Mixtures.

Now the heavier a fuel is (in the same class of fuels, of course) the more air it will take for complete combustion per one volume of vapour.

Thus a c.c. of petrol vapour would require from 40 to 50 c.c. of air, while paraffin vapour would need twice as much. True, weaker mixtures than these will certainly explode, but it is more economical to get complete combustion, and we will concern ourselves exclusively with the temperatures of induction needful to get the proper mixture.

It is an easy matter to calculate from chemical principles the volume of air required by various fuels (assuming a definite mixture of typical compounds for each, according to its density and range of boiling point), and, without bothering the reader with details, I give the actual figures:

Petrol No. I.	50	Volumes of air per one volume of pure vapour.
,, No. II.	60	
,, No. III.	75	
Paraffin	100	

(By pure vapour is meant vapour such as would be obtained by boiling the fuel unmixed with air.)

The "Attenuation Theory."

"But if we heat the induction we expand the gas, and less will enter, entailing less fuel per stroke, and so less power," I hear many readers say. Well, let us discuss the matter systematically.

The curve at the top of fig. 2 has been obtained by considering a vessel of 1,000 c.c. capacity and working out how much air would actually be contained therein at various pre-determined temperatures, *its contents at any temperature being cooled to* 0° *centigrade and measured.*

For instance, if the cylinder were filled at 0° C., and then heated to 60° C., some air would escape, and the remainder, if again cooled, would occupy 820 c.c.

Hot or Cold Induction?

Now, this 820 c.c. might be saturated with vapour, and the amount present is determined by the expression already given. (Scientific readers will say at first, "But it is the 1,000 c.c. that are to be saturated." Strictly speaking, it is, but a little thought will show that by taking the reduced volume we co-ordinate vapour volume and weight of fuel.)

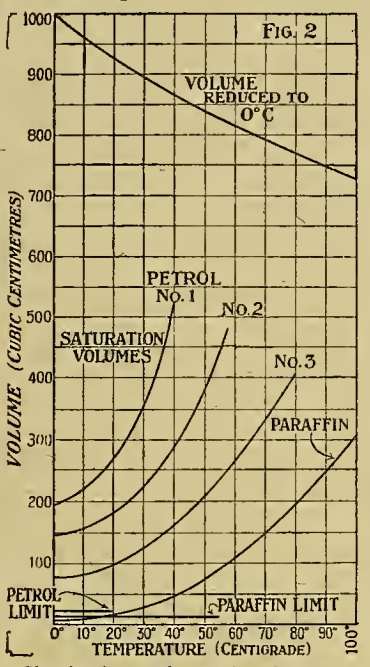
From the data furnished by my vapour pressure experiments I calculated this quantity for various fuels at successive temperatures, obtaining thereby the three lower curves of fig. 2.

Herein lies the discomfiture of the "attenuation theory" *per se*. It is strikingly plain that, instead of getting less, the volume of fuel in the cylinder increases enormously with increasing temperature.

Hot or Cold?

So now for the great question! With what fuels is hot induction needed and with what is it superfluous? In the curves of fig. 2 we have all our data.

From the quantities mentioned above we find that a litre of explosive mixture containing paraffin vapour and air should have 10 c.c. of paraffin vapour. On fig. 2 we therefore draw a horizontal line at 10 c.c. It cuts the curve at a point indicating about 20° C. Now, if we have air at less than 20° it cannot pick up enough vapour to reach the explosive limit, so here, *in the case of paraffin, induction heating is necessary.*



Showing degree of saturation of various fuels at different temperatures.

But now for the three petrols! Petrol No. I. requires most vapour in the litre space—20 c.c., in fact. Let us draw a similar line at 20 c.c. and see what happens. The line does not cut the petrol curves at any reasonable temperature. Even Petrol No. III. —that anathematised bugbear of weary kick startists and handle-swingers—comes nowhere near it.

But it may be argued that these results are only theoretical, and need modification according to the type of carburetter used. Let us examine this problem. Throughout the foregoing it has been assumed that all the air passing the throttle gets saturated with vapour. In the case of a wick carburetter or the old-fashioned surface instrument this is the case. But a modern jet type supplies a suspension of tiny drops which evaporate in transit, either in the induction pipe or on contact with the hot cylinder walls. In such a case once the engine is hot the vapour becomes supersaturated at the throttle and undersaturated in the cylinder, and *better results would be obtained than the foregoing results would show.*

If the jet happens to be partially stopped up, however, or too small, the air will not even be saturated at the throttle. This is not the fault of the theory, but of the carburetter, which merely needs scientific adjustment.

Summing up, the only fuel which needs induction heating is paraffin, or, more generally, any fuel above specific gravity 0.800 in the petrol-paraffin series.

H. J. POOLE, Int.B.Sc.

THE HANDLE-BAR DECOMPRESSOR.

A Simple and Convenient Auxiliary Means of Control.

LONG experience as a Scott rider has taught me the value of a decompressor which, though not intended to be used as a means of stopping the engine, is nevertheless sufficient to enable one to reduce the compression to the very merest burble, thus eliminating all knock or fierceness in the pulling during brief intervals of stress. As every rider of a Scott machine knows, the decompressor on this machine is used not only for starting, but also as a means of control when under way—as, for example, when changing from low gear to high, so that the engine does not race while the gear goes gradually home and obtains its full grip. In traffic it is endlessly useful, for on running slowly on top the slightest pressure on the decompressor lever prevents any tendency in the direction of knocking, and enables the engine to turn over to an easy, steady tune instead of labouring harshly.

Variable Compression.

A petrol engine required to pull hard over a wide range of speeds should, theoretically, possess variable compression, but as it is an engine is turned out to attain a certain speed at a certain load, and the compression ratio is fixed to obtain this result.

The same ratio, therefore, is not correct when it comes to much lower speeds at approximately the same load. In other words, the compression of a motor cycle engine is not the best that might be given were we riding eternally in traffic, and it is for this reason that some means of varying the compression to suit the emergencies of the moment is advantageous. The simple means of allowing a part of the charge to escape may be wasteful, but it saves the engine, and though certainly I do not recommend the use of the exhaust valve lifter as a means of control, it may be pointed out that the only objection to this system is that it is rough on the exhaust valve.

When turning from a Scott to some other make I miss the h.b. decompressor more than anything, for, even though full use be made of the throttle lever and the gears, there are times when the pressure of the finger on this little instrument would add much to the comfort of both rider and engine.

CHINOOK.

[Incidentally, a recent two-stroke design reviewed in *The Motor Cycle* embodied a device to obtain the choice of three compression ratios at will.—ED.]

NO AGE LIMIT.

A Selection of Letters from "Young-old" Riders who are in the "Sixties."

IN last week's issue and that preceding it we gave letters from "young-old" motor cyclists who responded to our invitation to send us their experiences. So far we have published communications from seven riders whose total ages amount to 508 years, or an average of over seventy-two.

Below we give a selection of letters from readers who are riders over sixty years of age, to which grade of veteran and to all old-young riders we repeat our invitation to send photographs and comments. This series of experiences is not published exclusively to find the oldest motor cyclist, but to show that there is no age limit where the motor cycle is concerned, and experiences from men of

A 69 year old Scottish rider who has two motor cycles in use.

mature years may go far to remove any doubt which at present may exist in the minds of many old-young readers who are hesitating about joining the ranks of motor cyclists. With present-day reliability, ease of starting, and controllability, there is no reason why the average man over sixty years of age should not enjoy the pleasures of the open road with his sons and grandsons.

A Long Record.

Mr. Robert Cumming, of 71, Broad Street, Aberdeen, who is in his sixty-ninth year, regularly uses two machines—twins he calls them—a Baby Levis and a Baby Triumph. He gives his record below:

"At the age of seventeen," he writes, "I commenced cycling on a 'bone-shaker.' Then came the 50in. Spider, followed by the Kangaroo, a Crypto gear, and then a safety bicycle with cross frame and gate hinge neck weighing about 70 lb. Afterwards came the Swift with spring forks, not unlike the present Druid. My first Swift had cushion tyres, but when the Dunlop tyres came along I had them solutioned on to the rims.

"My first motor cycle, obtained in 1905, was an Ormonde, with 2¾ h.p. Kelecom engine, placed underneath the seat, with a short belt drive. The sparking plug was on the right side, projecting outwards, so that when pedalling the leg came in contact, with the result that the trousers got warm, and the rider often got a shock!

"I had the first sidecar in this town, and when learning to drive it had the usual experiences of getting into the ditch.

"My next mount was a Clement-Garrard with round belt drive and jockey pulley—a beautiful little lightweight. Since then I have had numerous other makes, and now, in my sixty-ninth year, have 'twins'!—a Baby Levis and a Baby Triumph. The former I use mostly in town, as I find it even easier than an ordinary push bicycle when going through traffic.

"In conclusion, I can recommend a lightweight to any old cyclist who is thinking of taking the 'plunge.' He will manage it first go."

Another reader, Mr. H. J. Hodder, of Taunton, sends us news of a sixty-six year old veteran who is too modest to do this himself. He writes:

"Mr. Sibley is between sixty-five and sixty-six years of age, and two years ago had never touched a motor cycle of any description. Having many public duties to perform, and the train service being bad, I offered to teach him to ride. He purchased a Dayton lightweight, and within a half-hour of leaving the house he started off on a ten-mile trip by himself. He has since purchased two 2¾ h.p. Allon two-strokes, and went for a fifty-mile trip even as recently as last week, also a fifty-mile run the previous week with the club now formed in this town.

An "All-weather" Rider.

"Although he has been riding constantly in all weathers, Mr. Sibley has never been in any difficulty, and obtains the keenest enjoyment from his runs. I may say that Mr. Sibley is not of a mechanical turn of mind, and has not been accustomed to machines of any description, and started two years ago as a pure novice."

Mr. S. Walker, of Sale, Cheshire, who is sixty-five years of age, writes as follows:

"I shall be sixty-five in a month or so, and purchased a Junior Triumph in March last. Since then I have had a number of short trips, and on Tuesday last went thirty-four miles in 2¼ hours; not excessive speed for a young man, but just as fast as I care to go. I am looking forward to having some nice runs this year. The machine runs beautifully, and I have not had any trouble."

We have also received a letter from Mr. A. J. Hicks, of Clapton, who is sixty-three years of age, and thinks nothing of riding a hundred miles in the evening after being "at the bench" on aircraft work for nine hours. He commenced cycling at the age of ten on a hobby-horse.

Several of our "old young" readers are clergymen, who find their machines of great utility in connection with their work in scattered parishes. The Rev. H. G. Stembridge, of Keysoe, St. Neots, did not commence motoring until sixty-two years of age. He writes:

"I began my career of motor cycling on my sixty-second birthday. I then bought, on February 27th, a second-hand 3½ h.p. Triumph and cane sidecar. The engine is a 1908 one, and the motor cycle was fitted with a Sturmey-Archer three-speed hub and clutch a year or two later.

"For this, my beginners' outfit, I paid £35—and I think it was a good investment.

A Sidecar Enthusiast.

"I am a country Nonconformist minister, living ten miles from anywhere, and have a big district to look after, and I find the sidecar an admirable help for my wife in our visitation, and for town and station work.

"At first I had plug trouble, and did not know what was the matter; and then the magneto, with worn-out platinum points and a gap of nearer a quarter of an inch than an eighth, often refused to spark at all, but after new points were fitted and adjusted all went well for a time.

'Then I traced my second magneto trouble to a dirty carbon brush and high-tension cable connection, and in finding these things my education was advanced. *Experientia docet.*

"Next, with the aid of my youngest boy, I took down the engine, decarbonised it, fitted up new valve springs with proper lift to the valves, ground these in, and got a new bush turned up for the big end of the connecting rod.

"After a few short trips, on one of which I ran against a farm cart, and on another brought the 'chair' over on the top of me going round a corner, both without much damage being done, I undertook a journey to Luton and back, thirty miles each way.

"The outward journey was done in good style, and I felt rather proud of myself and the ancient mount.

"I am a regular reader of *The Motor Cycle*, and much enjoy and profit by it."

The Rev. H. G. Stembridge, of St. Neots (age 67).

Scottish Six Days Open Reliability Trial.

Popular Scottish Event to be held July 21st to July 26th.

PROBABLY no motor cycling event of pre-war days appealed more strongly to the sporting rider than the Scottish Six Days Open Trial, and it is with much pleasure that we announce that our Edinburgh friends have decided, at the eleventh hour, as it were, to hold this fascinating event again this year. The trial will take place on July 21st to 26th, and the route and conditions of the trial are practically the same as those which obtained in 1914. We give all the information available up to the time of going to press. Slight re-adjustments and improvements are liable to be made, more particularly, however, as regards matters which do not concern the competitor. There may also be slight diversions as concerns the route, much of which has not been visited since 1914, but it is probable that no alteration will be made in the observed test hills. Messrs. Campbell McGregor and D. A. McKay, of 6, Castle Terrace Edinburgh, the headquarters of the Edinburgh Motor Club, Ltd., have the administration of the trial in hand, and to them all communications should be addressed. Hotel coupons, by which competitors and others doing the round of the trials are relieved of all responsibility *en route*, are again to be provided. Entrants having unused coupons will be refunded their face value, provided application is made within a week.

Route.

FIRST DAY.—Edinburgh, Stirling, Crieff, Amulree, Kenmore, Aberfeldy, Trinafour, Dalnacardoch, Pitlochry, Tullymet, Dunkeld, Perth. 157 miles approximately.

SECOND DAY.—Perth, Coupar Angus, Forfar, Brechin, Edzell, Cairn o' Mount, Ballater, Crathie, Cockbridge, Tomintoul, Grantown, Inverness. 168 miles approximately.

THIRD DAY.—Inverness, Abriachan, Beanly, Braemore Lodge, Dundonnell, Gairloch, Garve, Inverness. 179 miles approximately.

FOURTH DAY.—Inverness to Applecross, returning by Auchnashellach, Kinlochewe, to Inverness. 179 miles approximately.

FIFTH DAY.—Inverness, approach Beanly, by Abriachan, Drumnadrochit, to Cluanie, returning by Tomdown, Invergarry, Glendoe, Craggie Inn, Grantown. 145 miles approximately.

SIXTH DAY.—Grantown, by Tomintoul, Braemar, to Pitlochry, Ballinluig, Kenmore, Crieff, Stirling, Edinburgh. 185 miles approximately.

Total distance, approximately, 1,013 miles.

Regulations.

Machines, of course, must be in touring order, *i.e.*, fitted with stand and carrier, two independent brakes, an efficient silencer, standard mudguards, tyres, tool-box, and lamps, and conform in every way to the Motor Car Act, 1903.

The following spare parts only may be carried: Tyre repair outfit, sparking plugs, magneto parts, belts, chains, tyres, inner tubes, valves, and a selection of nuts and washers. A competitor desiring to carry some further spare parts must submit them to the officials for approval before the trial.

The following is the scale of entry fees:

Manufacturers nominating a non-member to ride ...	£8
,, ,, ,, member ,, ,, ...	£7
Agent non-members or nominating a non-member ...	£6
,, members ,, ,, ,, member	£5
Private owners, non-members	£3
,, ,, members	£2

To qualify for a first-class award a competitor must lose no marks on reliability, climb all observed hills (seven in number), and lose not more than twenty marks on the final condition of his machine. The system of marking will be worked out on the basis of—

(a) Reliability,
(b) Hill-climbing, and
(c) Condition of machine.

Thus a second-class award will be given to all who

(1) Fulfil *(a)* and *(b)*, but lose more than twenty marks under *(c)*; or

(2) Lose up to sixty marks on reliability, climb five or more hills, and lose not more than twenty marks under condition of machine heading.

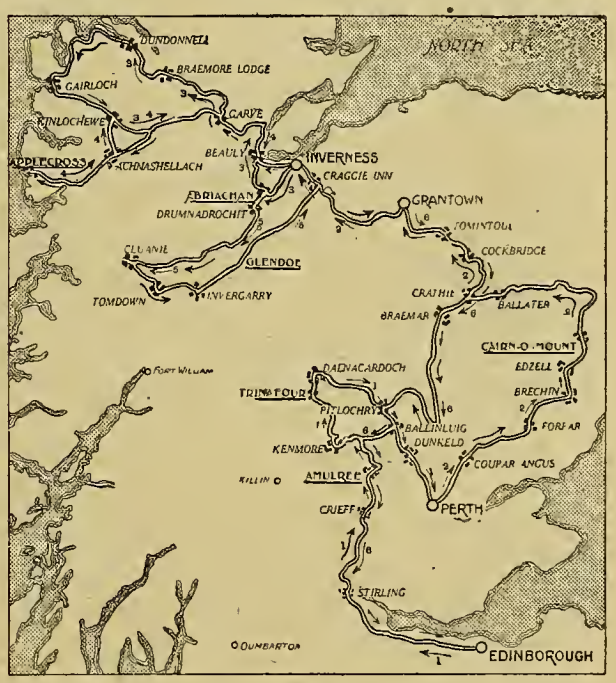
Third-class awards will be given to all who comply with the conditions, but fail to qualify for first and second-class awards.

Reliability takes precedence, and although one mark will be lost for each failure on an observed hill, a competitor who loses *no* marks on *reliability* but fails on two hills will be placed before an entrant who is two minutes late on time and climbs all hills. This applies, of course, only to second and third-class awards.

Balloting and Starting.

All entries received prior to July 5th will be included in the first ballot, occupying the numbers from 1 onwards, subsequent ballots being held till July 11th.

Entrants must present their machines at Croall's Garage, Castle Terrace, Edinburgh, on July 20th. Specific instructions will be sent to entrants notifying them as to the time their machines are to be presented. Each machine, on being handed over, must be prepared with a piece of sixteen gauge copper wire passing round each cylinder, and thence to a frame member in such a manner that a seal can be affixed, the removal of a cylinder necessitating the breakage of this seal.



Route for the Scottish Six Days Trial (approximately 1,000 miles).

Protests must be written, and must be accompanied by a deposit of one guinea, which will be forfeited in the event of the protest being considered frivolous. Entrants who claim that they have been baulked must be prepared to assist the officials by taking the number of the competitor who baulked them.

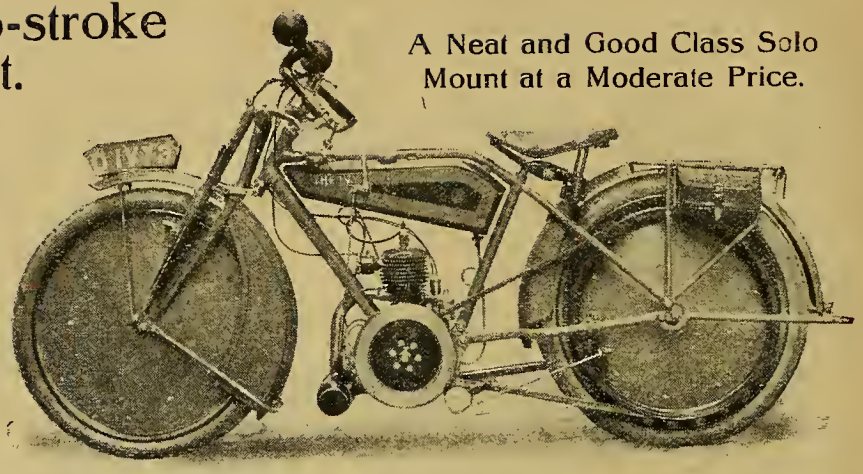
Under the heading of condition of machine it is impossible for a competitor to earn marks; he can merely lose marks for defects. For breakage of frame, forks, or handle-bars a competitor must retire immediately.

Ten marks will be lost for each of the following defects: Broken carriers and leaking tanks. Five marks will be lost for each broken front wheel stand, broken rear stand, broken or disconnected control wires, broken mudguards, broken petrol pipe, front or back brake out of order, broken or loose chain cases, and damaged silencer. One mark will be lost for each broken spoke, and marks up to ten may be lost for any other breakage.

No secret checks are to be included.

A Sporting Two-stroke Lightweight.

A Neat and Good Class Solo Mount at a Moderate Price.



The Ivy sporting model, 224 c.c. engine, disc wheels, weight 130 lb.

WITH one or two exceptions, two-stroke lightweights are so much alike that any break away from the conventional black enamel finish at once attracts attention. Without looking at all "freakish," the 1919 Ivy, with its disc wheels and framework of khaki-grey, and a tank of the same colour, with a black panel and picked out with black and gold lines, immediately stands out as a good class proposition.

It is a handsome little machine, and, as will be noticed in the illustrations, the lines are good and give a sporting appearance.

Added strength is given to the heavy gauge steel tube frame by the duplex construction of the front down tubes. These firmly support the Ivy 224 c.c. engine, rated at 2½ h.p., which is practically identical with the engine which made such a good showing in the 1914 Junior T.T.

We recently had the opportunity of sampling the "I.O.M." sporting model, as it is called, which we took on a forty mile run. As the engine had not been run in, we did not, of course, expect too much in the way of speed, but we were favourably impressed by its smooth running and pulling power. The machine is exceedingly comfortable to ride, due to the excellent saddle and Ivy spring forks, combined with the convenient "set" of the bars. Proof of the good steering was afforded by the fact that we were able to ride considerable distances without touching the bars, despite the inequalities of the road surface.

A little extra air inlet is provided on the induction pipe which helps in the cool running considerably, and doubtless reduces the petrol consumption. Pulling power is not in any way lacking, as we proved by slowing down on hills of no mean gradient and running at about 10 m.p.h. to the top. We also tested the accelerating powers of the engine by throttling down to 7 or 8 m.p.h. and suddenly opening the throttle, when the machine would quickly pick up speed without a sign of four-stroking. A speed of a little over 30 m.p.h. on the flat was obtained, which would doubtless be increased when the engine was properly run in.

Other details are tank capacity one gallon, tyres 26 × 2¼in. black celluloid-covered bars with a special extension for the attachment of a lamp. The magneto fitted is an E.I.C., and Albion two-speed gear box is an option. The weight of the machine is 130 lb., and price £48 7s. 6d.

Messrs. Newman and Sons, whose works are at Aston Cross, Birmingham, are concentrating on these two models, and, as the war-time contracts are completed, hope to turn them out in increasing numbers.

Racing in Italy.

THE first important motor cycle road race since the war was held recently near Rome, over a course of 255 kilometres. Although only fourteen entries, the greatest enthusiasm was displayed. With the exception of the Frera team, all competitors were amateurs. Prohibition of imports accounted for the small field.

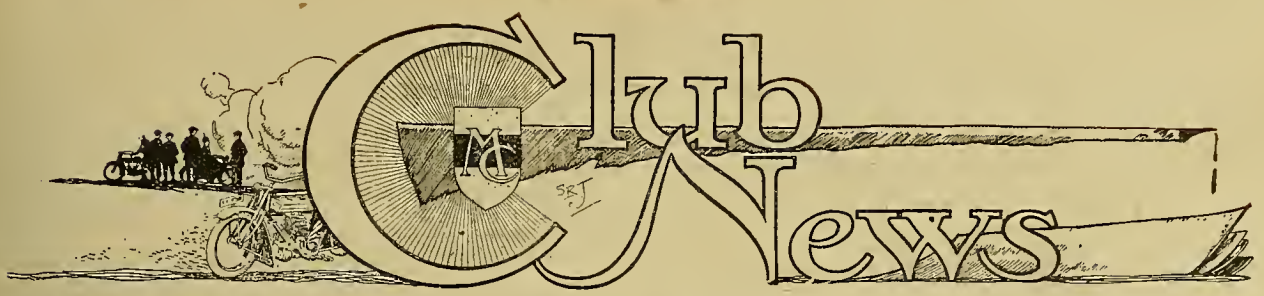
The fastest time in the first lap was made by Ranaboldi (Motosacoche), closely followed by Tuccimei (Triumph) and Acerboni (Frera); but in the next lap Acerboni took the lead, and kept at the front. Many competitors suffered from tyre trouble.

The winner rode one of the new model Frera machines—a single-cylinder of 500 c.c., bore and stroke 85×88 mm. The front fork of this new model resembles closely the Triumph, but has two springs instead of one—the second being to check rebound. The results were as follow:

1.	Acerboni (Frera)	3.36 hours*
2.	Tuccimei (Triumph)	3.56 ,,
3.	Ranaboldi (Motosacoche) ..	4.16 ,,
4.	Galluppi (Rudge)	4.21 ,,

*Equals 41 m.p.h.

(Left) Mario Acerboni (Frera), the winner of the Italian T.T. (Right) Tuccimei (Triumph) going well at one of the bends.



Notice to Club Secretaries.

Club news and fixtures for this page should reach the editor by Friday morning preceding date of issue. We ask club officials to advise us *immediately* in cases where an event is postponed.

Troedyrhiw and District M.C.

A hill-climb has been arranged to be held to-day (Thursday, July 3rd) at Llanfabon, when three events will be run. (1) solo and (2) sidecars on A.C.U. formula, (3) flexibility, one gear only; no clutches to be used. Weighing will commence at the quarry weighbridge, Merthyr Vale, at 4 p.m.

The Douglas Club (Nottingham).

This new club, which is confined to riders of Douglas motor cycles, is offering a prize, open to any Douglas owner from any district for the smartest machine of that make at the Nottingham club rally at Dovedale on July 6th. The age of the machine will be taken into consideration.

Reading and District M.C.C.

There now appears to be a general desire in Reading for the activities of the Reading and District M.C.C. to be resumed. Mr. F. O. Mosley, Whernside, Basingstoke Road, Reading, the hon. secretary in 1914, is anxious to arrange a meeting for discussion of the position. Interested motor cyclists are asked to communicate with him at the address mentioned.

N.M.C.F.U. (Leeds).

The Leeds branch of the National Motor Cyclists' Fuel Union recently held a slow hill-climb at Garrowby Hill, which attracted fourteen entries. The donor of the first prize was F. G. Toze, who also made the best performance. Results:

	m.	s.
F. G. Toze (A.J.S. sc.)	13	0
F. W. Wilkinson (New Hudson sc.) ..	10	22
T. H. Clarke (A.J.S. sc.)	10	4
H. Pattinson (2¾ Revere)	9	40

Middlesbrough and District M.C.C.

Ten members competed in the recent trial for the Craddy cup. The results are as follow:

Competitor and Make of Motor.	Estimate of Speed.	Actual Speed.	Error.
	m.p.h.	m.p.h.	m.p.h.
1 C. J. Dingle (2¾ Douglas) .	24.0	24.0	None.
2 J. Gilchrist (6 A.J.S. sc.) .	21.5	21.8	.3
3 C. Close (3½ Singer)	18.0	18.6	.6
4 H. Williams (7-9 Indian) .	25.0	24.0	1.0
A. Blackburn (8 Bat-Jap).	20.0	21.2	1.2
W. Wesson (7-9 Indian) ..	21.5	23.1	1.6
W. Ryan (7-9 Indian) ...	27.0	28.8	1.8
G. Blackburn (8 Bat-Jap) .	20.5	23.2	2.7
A. Young (Morgan)	19.0	21.8	2.8
H. Broadbent (6 Matchless)	18.5	22.2	3.7

Future Events.

July 3.—Cumberland County M.C.C., Carlisle. Hill-climb at Warnell Fell.
July 3.—Taunton and District M.C.C. Reliability Trial.
July 3.—Troedyrhiw and District M.C. Hill-climb at Llanfabon.
JULY 4 AND 5.—ARBUTHNOT TROPHY TWO DAYS TRIAL. PLYMOUTH DISTRICT.
July 5.—M.C.C. Hill-climb.
July 5.—Birmingham M.C.C. Social Tour.
July 5.—Streatham and District M.C.C. Members' Reliability Trial.
July 5.—Wolverhampton M.C.C. Half-day Reliability Trial.
July 6.—Woolwich, Plumstead and District M.C. Picnic Run to Toy's Hill.
July 6.—Cumberland County M.C.C., Carlisle. Social Run.
July 6.—Western M.C.C., Glasgow. Run to Clovenfords.
July 6.—Nottingham and District M.C.C. Rally at Dovedale.
JULY 6.—OLDHAM AND DISTRICT M.C. RELIABILITY TRIAL.
JULY 12.—LIVERPOOL M.C. RACES AT COLWYN BAY.
July 12.—Public Schools M.C.C. "Touch Nothing" Run.
July 12.—Western M.C.C. Team Trial.
July 12.—Motor Cycling Club. Hill-climb.
July 13.—Wolverhampton M.C.C. Social Run to Stratford-on-Avon.
July 14.—Troedyrhiw and District M.C. "Disarranging" Competition.
JULY 14-15.—M.C.U. OF IRELAND; ULSTER CENTRE. IRISH END-TO-END RELIABILITY RUN.
July 16.—York and District M.C. Reliability Trial.
July 19.—Middlesbrough and District M.C.C. Sidecar Competition.
JULY 19.—SUTTON COLDFIELD AND MIDWARWICKSHIRE A.C. OPEN HILL-CLIMB AT STILE COP, NEAR RUGELEY.
JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.
July 19-20.—Cumberland County M.C.C., Carlisle. Reliability Trial to Aberdeen and Back.
July 20.—Nottingham and District M.C.C. Run to Donington.
JULY 21-26.—SCOTTISH SIX DAYS TRIAL.
JULY 23.—ESSEX M.C. SPEED TRIALS AT SOUTHEND.
JULY 26.—SUTTON COLDFIELD AND MIDWARWICKSHIRE A.C. LIGHTWEIGHT TRIAL FOR CALTHORPE CUP.
July 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.
July 27.—Trocdyrhiw and District M.C. Reliability Run.
AUG. 16.—S.E. COUNTIES INTER-TEAM. TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Orkney M.C.

The Orkney M.C. has been reformed, and now consists of motor cyclists only. An attractive programme of events is being arranged.

North Birmingham A.C.

This club is holding a members' reliability trial and speed-judging competition on the 26th inst. Three prizes will be awarded. The annual reliability trial for the Shell cup will be held early in September. Hon. secretary is Mr. A. W. Thrush, 34, Reservoir Road, Erdington.

Sutton Coldfield A.C.

Mr. F. W. Finnemore, 122, Colmore Row, Birmingham, the secretary and treasurer of the above club, wishes to learn the present address of H. Graham-Dixon, a well-known competition rider before the war, and who is the present holder of the Muratti Ariston trophy.

Coventry and Warwickshire M.C.

The second paper-chase will be held by this club on Saturday next, the 5th inst., starting from Davenport Road, Coventry, at 2 p.m. sharp. A speed-judging competition will be incorporated with the run, and prizes will be awarded to the winners. Hon. sec., Mr. M. F. W. Sampson, 19, Hertford Street, Coventry.

Leven and East of Fife M.C.C.

An open speed contest under the auspices of the above club will be held on the West Sands, St. Andrews, on Saturday, the 5th inst., commencing at twelve o'clock noon, under the rules and regulations of the S.A.C.U. Entry forms to be had on application to the hon. secretary, Mr. Jas. Robertson, 5, Lemon Terrace, Leven, and Messrs. Christie Bros., motor agents, St. Andrews.

Ealing and District M.C.C.

This club was formed long before the war, and is affiliated to the A.C.U. The Ealing district has large numbers of keen motor cyclists, and the hon. sec., Mr. S. P. L. Brown, 25, Ormiston Road, Shepherd's Bush, W 12, would be glad to hear from them with a view to their joining the club, the officers of which are as follow: President, Major A. M. Low, R.A.F., A.C.G.I., D.Sc., etc.; captain, K. V. Chidley; hon. treasurer, L. Pulham; official timekeeper, D. Jones.

Public Schools M.C.C.

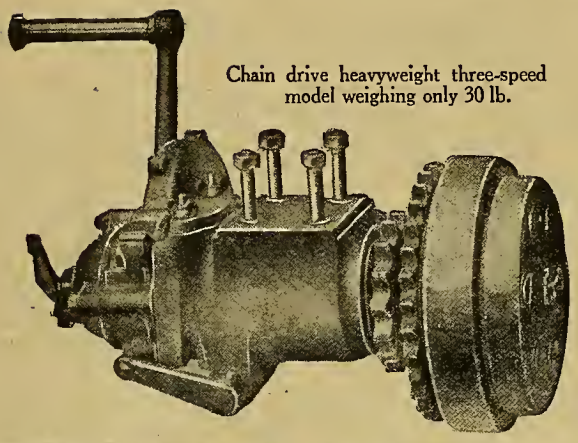
The recent surprise competition proved to be a most amusing event and included several unconventional items. The first competition consisted of starting within a distance of twelve yards. The best performance was made by P. Davey (4 h.p. Norton). Then, without warning, the competitors were all asked the bore and stroke of the 4 h.p. Triumph, and, strange to say, nobody could answer this question accurately. The next test, a figure 8, was most neatly executed by Davey (Norton), followed by Tweedie (Black Demon). The last test was a speed burst in pairs over a distance of 120 yards. Here, again, the Norton was victorious. Results:

1. P. Davey (4 Norton), winner of silver cup.
2. { B. Garland (6 Bat). K. Tweedie (6 Black Demon). C. D. Wright (7 Harley-Davidson). E. M. P. Boileau (3½ Sunbeam).
6. D. W. Brett (3½ Rover).

The next competition is a week-end "touch-nothing" run on the 12th.

BURMAN GEAR ASSEMBLIES.

Two Little Known but Well Tried Gear Boxes.



Chain drive heavyweight three-speed model weighing only 30 lb.

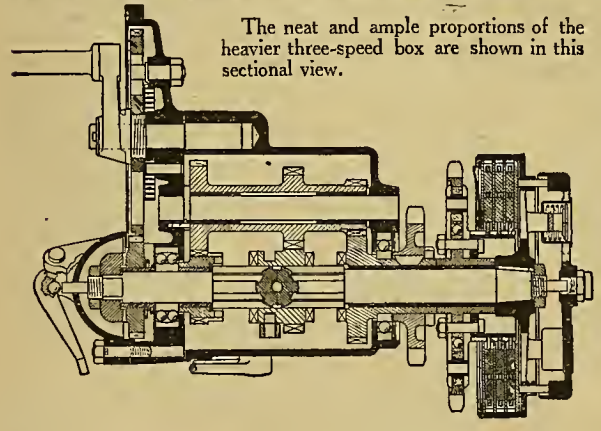
REALLY substantial gear assemblies are few and far between at the present time, so that motor cycle manufacturers as a whole will welcome the appearance on the open market of the Burman gear units, made by Messrs. Burman and Son, Ltd., Ryland Road, Birmingham. These are by no means new propositions. Before the war the small gear box was very popular with several makers of lightweight motor cycles, and during hostilities the larger one has been supplied in considerable quantities to the makers of the 8 h.p. New Imperial, on which machine it has given every satisfaction. Unfortunately, at present, the output is somewhat restricted, and Messrs. Burman are not able to cope with the existing orders, a state of affairs it is hoped will not obtain for long.

The two principal models are a two-speed and clutch lightweight box with kick-starter, and a three-speed box with clutch kick-starter and shock-absorber for machines of 4 h.p. and over.

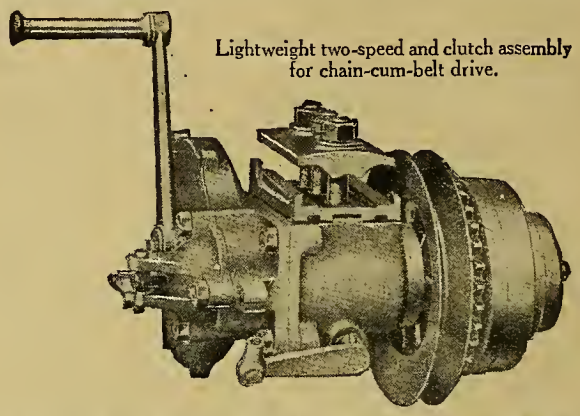
The Lightweight Model.

For machines up to 4 h.p. the smaller unit is an attractive proposition. It provides two ratios (1.0 and 1.85), a large sized clutch, and fool-proof kick-starter. As in the larger box, all the gears and shafts are made of the well-known Kayser Ellison steel adequately heat treated. Both lay gears are on a common sleeve internally bushed to run on the solid layshaft, which is securely anchored at both ends. Ball bearings, however, are provided for the hollow main shaft which supports the two gears, and is splined for the double sliding dogs. One of the bearings is designed to take the end thrust when the clutch is operated, the operating rod passing through the shaft.

There are several features which point to much thought in designing the clutch. This unit, which is on the end of the main shaft, consists of three plates carrying cork or Ferodo inserts interposed between plain steel plates, against which they are held by the pressure of five light spiral springs disposed round the circular aluminium clutch cover, the pressure being transmitted by a number of small pins to the edge of the outside steel plate. As a big frictional surface is employed, combined with light springs, the clutch operation is extremely easy and smooth.



The neat and ample proportions of the heavier three-speed box are shown in this sectional view.

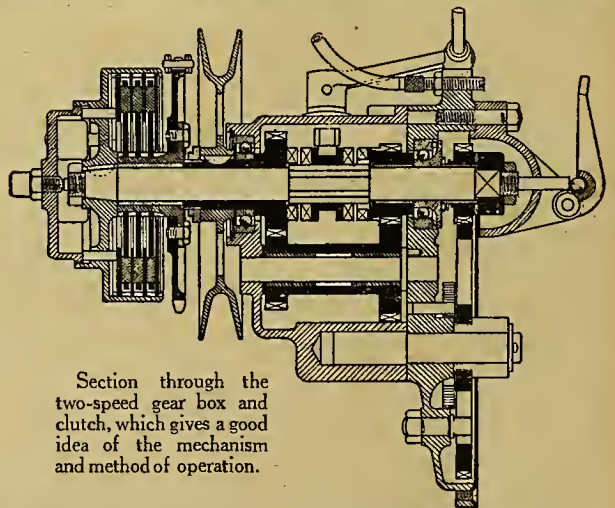


Lightweight two-speed and clutch assembly for chain-cum-belt drive.

Another excellent feature is the novel shock-absorbing arrangement. The chain sprocket is drilled with a number of holes into which thick rubber bushes are forced. Through these are fitted steel pegs, the ends of which terminate in metal discs on either side of the chain wheel; these in turn are attached to the flanges on the main shaft.

A Larger Model.

The three-speed box suitable for machines of from 4 to 8 h.p. is very similar to the smaller one in all respects except that the sliding dogs on the mainshaft have another pinion integral with them, which engages a corresponding gear on the layshaft, providing the middle speed and giving altogether ratios of 1.0, 1.89, and 2.82. Naturally, the clutch is proportionally larger, having two concentric rings of inserts instead of one—one on each plate. The kick-starter



Section through the two-speed gear box and clutch, which gives a good idea of the mechanism and method of operation.

is of similar design on each box, and consists of a good strong lever connected to a toothed quadrant, which engages with a gear wheel having ratchet teeth on its side. These latter engage in turn with a ratchet on the gearshaft, which is held up to it by a light coil spring. The lever itself is retained in position by a strong clock spring, which, together with the quadrant, is enclosed by a neat metal cover.

THE TRIALS EPIDEMIC.

Well-known Manufacturers Organise a "Staff" Event. Sutton Coldfield A.C. Lightweight Trial.

BEFORE the war there was a feeling that the popularity of motor cycle competitions was on the wane, but, since the Armistice, there has been quite an epidemic of trials—open and club events—which shows that competitions are more popular than ever. Provided some novelty is introduced and irritating time factors eliminated, there is no reason to believe that trials and tests of all kinds will fail to attract entries.

The Humber Staff Trial.

This year "staff" trials may become a feature in the competition field. Two weeks ago, *The Motor Cycle* staff held a private event, and on the 12th inst. the Humber staff is holding a trial over an eighty mile course, which will include stopping and restarting, braking and slow running tests. A silver cup will be awarded for the best performance, and there will be a number of other prizes for the respective classes.

Although entries are only accepted from actual Humber employees, there is no bar to the make or power of machine that may be entered, so that, even though it is an exclusive trial, it is, so far as motor cycles and cars are concerned, an open one, and is, we believe, the first of its kind promoted by any motor manufacturing firm in the country. It is the intention of Humber, Ltd., to continue these events in the future, which is a step in the direction of creating that feeling of united interest in engineering progress amongst a community of workers and directors which is so desirable.

Sutton Coldfield A.C. Trial for Lightweights.

This open reliability trial, which will be held on the 26th inst., will start from the "George in the Tree" at Berkswell, and the turning point of the course is at Banbury. Entries will be confined to lightweights and scooters with engines not exceeding 230 c.c.

There will be a stopping and restarting test on Sunrising, and a fast time test on Edge Hill, and competitors will be penalised on time only if they are more than three minutes late or early at the end of the outward and return journeys. This rule should do much to remove the annoyance caused by timing the competitors' time to split seconds. A lower schedule average per hour will be worked out for scooters.

The winner of the trial will be awarded the Calthorpe trophy (value one hundred guineas), together with a replica (value ten guineas).

In addition there will be gold medals as second and third prizes, a special gold medal for the best scooter performance, and silver medals to all those making non-stop runs and obtaining full marks. Mr. F. W. Finnemore, 122, Colmore Row, Birmingham, is the organising secretary.

South Birmingham M.C.C. Open Trial Postponed.

The committee of the South Birmingham M.C.C. have decided to postpone their open trial, which was originally arranged for July 12th, until August 16th. A really sporting course has been chosen, which will not endanger the machine or the driver, and the aim of the committee is to eliminate one or two weak points that still exist in the modern machine. All communications should be addressed to Mr. E. Boydell, 93, John Bright Street, Birmingham.

THE ARBUTHNOT TROPHY TRIAL.

A Sporting Naval Two-day Event on Friday and Saturday next in the Plymouth District.

ALTHOUGH the entries in the Arbuthnot Trophy trial, which is being held under the auspices of the A.C.U. on Friday and Saturday next, will not be so numerous as in an open trial, the event is bound to create a great deal of interest on account of its nature—the fact that it is confined to officers of His Majesty's Navy, and because the trophy was subscribed for by the motor cycle public to perpetuate the memory of the late Rear-Admiral Sir Robert Keith Arbuthnot, Bart., K.C.B., M.V.O., who lost his life at the Battle of Jutland.

Friday's course will be 120 miles in length, and on Saturday 116 miles will be covered. The maximum speeds for different sections vary from 15 to 20 m.p.h., and a consistent driving test will be held on a hill which the competitors will have to ascend each day. The hill will be divided into two parts, the first part to be climbed at an average speed of not more than 10 m.p.h., and the second at an average speed of not less than 15 m.p.h. The difference between the time taken by a competitor to climb the slow and the fast parts of the hill respectively will be noted each day, and the competitor who most nearly repeats his performance of the first day will be adjudged the winner of this test.

If no competitor succeeds in completing the trial according to the regulations the rider who makes the lowest number of involuntary stops will hold the trophy, or if two or more competitors make the same number of stops, then, of these competitors, the one who makes the best performance in the consistent driving test will be awarded the trophy.

The Route—First Day.

The course will be marked by red arrows on a white ground on the portion to be covered during the morning, and by black arrows on yellow ground on the afternoon section.

Time of First Competit'r.		Speed.	Intermediate Distance.	Total Distance.
	NON-STOP SECTION No. 1.

12.20	Bodmin (Royal Hotel)	20	5½	59¼
	NON-STOP SECTION No. 2.			
2.0	Bodmin	—	—	—
2.14	Launceston (on left)	20	22	81¼
2.55	Tavistock	20	12½	93¾
4.12	Merrivale Bridge	20	5	98¾
	CONSISTENT DRIVING TEST.			
4.15		—	½	99¼
4.24	Princetown	—	2½	101¾
5.3	Crownhill (check)	20	11½	113¼
5.15	Plymouth	15	3	116¼

The trial is of a real sporting nature, and one such as will appeal to motor cyclists in the Navy. No doubt every competitor will take the event more seriously than is usual in trials of this nature, as the winning of the trophy will be a distinctive honour for the rider.

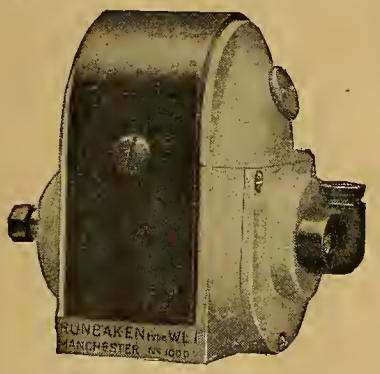
THE RUNBAKEN LIGHTWEIGHT MAGNETO.

A 3½ lb. Magneto incorporating Novel Features.

MOTOR cycle ignition has settled down into two standard forms of magneto—the usual high-tension instrument—and that working on the polar inductor principle as exemplified by the Dixie. The former type differs so little from the earliest Bosch magnetos that we welcome the novel features introduced by the Runbaken Magneto Co. Ltd., of Cheetwood Lane, Derby Street, Manchester, in their latest models.

Messrs. Runbaken, whose output has been until lately entirely consumed by war requirements, are about to market a complete range of ignition instrnments, from the largest car type to the miniature model forming the subject of this description, which will without doubt meet a growing demand for a small ignition instrument suitable for the several auxiliary engines, scooters, and small lightweights, the manufacturers of which have been handicapped for lack of this type of magneto.

Type W.L.I. is intended for use with single-cylinder engines up to 2¾ h.p. and weighs no more than 3½ lb., its overall



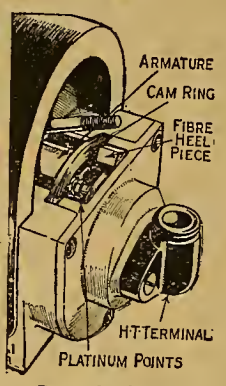
The Runbaken 3½ lb. magneto.

dimensions being: Length 4½in., width 2¾in., and height 4¼in. Externally, perhaps the most striking features beside the size are the position of the high-tension terminal and the apparent absence of any contact-breaker.

On closer examination, however, it is found that the armature unit includes a condenser at the driven end and a contact-breaker of the face cam type at the opposite end.

On removing the end plate by means of a knurled nut, the contact-breaker is revealed, and the adjustment of the platinum points is extremely simple, as there is plenty of room for the adjusting spanner—a point which is too often overlooked in the more normal design.

A slip ring, as such, is entirely dispensed with, and the carbon collector brush beds up against a brass plug connected, of course, to the secondary winding and lying inside an insulated extension of the armature spindle.



Part of the contact breaker revealed. Note the unconventional position of the high-tension terminal.

The standard magneto has fixed point ignition, but, if variable spark timing is required, a very simple method of altering the position of the cam ring has been devised, which enables the firing point to be varied through the maximum practicable range.

The actual details of construction include so many interesting features as to merit description. The first point of importance is that the face cam and ring for the contact-breaker is formed of non-magnetic steel, an alloy of steel with chromium and nickel in certain proportions which has the peculiar property of being non-magnetic.

The ball races which carry the armature are insulated from their housing, for it has been found by experiment that the current returning through greasy bearings has an electrolytic effect, which causes more wear than that involved by mechanical and frictional reasons. The bearings, it may be mentioned, are packed with a special grease which does not melt under running conditions, and do not require any further lubrication.

The makers have found that the most suitable aluminium alloy for the end plates and carcass is not ideal for die castings, but, though die castings are not used, a special method has been devised by means of which very smooth, clean results are obtained. Incidentally, the pole shoes are constructed as a unit with the carcass and the driven end plate, the armature unit being easily withdrawable from the opposite end.

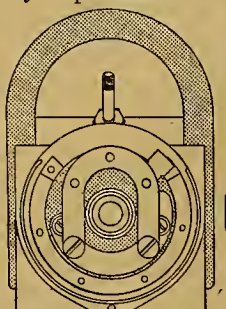
The armature unit comprises, besides the windings, which are built up to a special formula, a condenser, spark gap, earth brush, contact-breaker, and high-tension collector.

During a walk round the very compact and self-contained factory, which, though it was only completed in September, is to be almost doubled in size at an early date, we were able to examine a W.L.I. magneto which was undergoing bench tests.

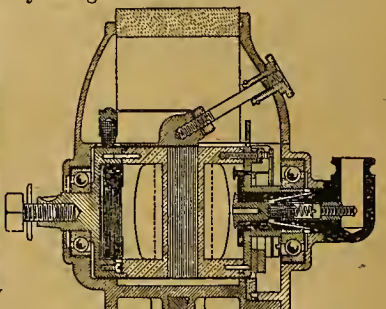
The results were extraordinary for so small an instrument. A spark passing the standard ball gap at a speed well below that at which any ordinary motor cycle engine will run, while, by means of a rotary spark gap, we were able to check the regularity of each spark at over 3,000 r.p.m.

The Runbaken Magneto Co. will market a slightly larger instrument for 3½ h.p. engines, and, by modifying the contact-breaker and high-tension collector, both types can be made suitable for twins.

Detail work has been as carefully studied as design, and the works are entirely self-contained, even the moulding being carried out on the premises. With the coming of the ultra-lightweight motor cycle, Messrs. The Runbaken Magneto Co., Ltd., are to be congratulated on producing so light and satisfactory an ignition unit.



The contact-breaker is of the face cam type.



Longitudinal section showing how the usual slip ring is entirely dispensed with.

M.C.C. MEMBERS' HILL-CLIMB.

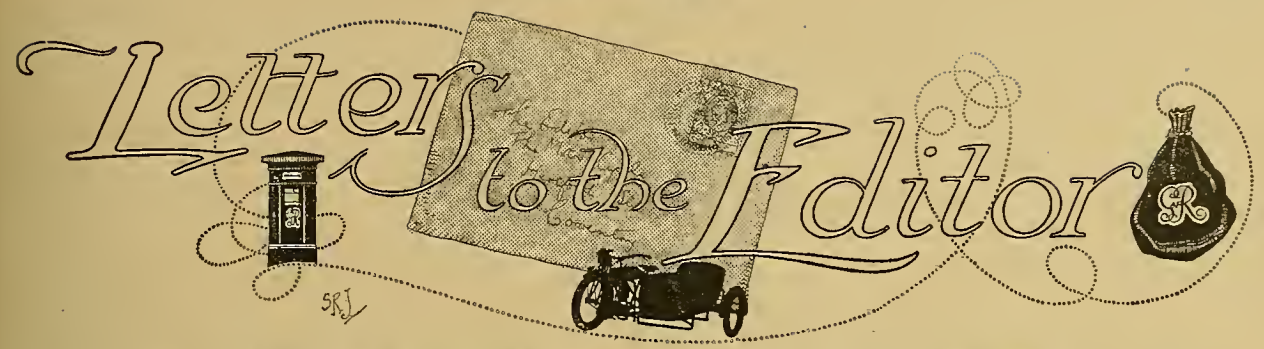
AS the Motor Cycling Club is one of the largest in this country, a good entry is expected for the members' hill-climb on the 12th inst. This event will be more interesting than the usual hill-climb, as the aim of the regulations is to provide a flexibility test. The hill will be divided into two sections:

The first section has to be covered without stoppage, and without the feet of the rider touching the ground, at as slow a pace as possible, from a "flying" start; the machine to be brought to a standstill after crossing the finishing line of the first section, and before reaching the starting line of the second section.

The second section to be traversed at as fast a pace as possible from a standing start. The order of merit in all classes will be determined by the figure obtained by subtracting the time for the fast section from the time for the slow section.

Motor cycles, sidecars, and cars must be standard touring types as usually sold to the public, fully equipped for the road. Classes:

(1.) Sidecar machines not exceeding 600 c.c.
(2.) Sidecar machines exceeding 600 c.c.
(3.) Solo motor cycles not exceeding 350 c.c.
(4.) Solo motor cycles not exceeding 600 c.c.
(5.) Solo motor-cycles exceeding 600 c.c.
(6.) Cycle cars conforming to the A.C.U. definition.
(7.) For cars (which must be standard touring types) no limit.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

PROFITEERING.

Sir,—We beg to say that we have had several complaints from riders of our Radco motor cycles to the effect that agents have been selling our machines at a premium, although we advertise in all the leading motor cycling papers our retail prices to the public. Under the circumstances, we wish to warn purchasers against any overcharges by these profiteers.

E. A. RADNALL AND CO.

BENZOLE.

Sir,—With reference to a letter from one of your correspondents recently regarding benzole, the following may be of interest.

During the past week-end, on a 3½ h.p. Rudge-Multi, 1919 model, I covered a total distance of 244 miles (eighty miles with a passenger on the carrier) on a tankful of benzole (two gallons). On test my machine covered 135 miles on one gallon of the same fuel. I have tried petrol (No. 1), but riding with the spark advanced as for benzole the engine knocked badly on hills and when going slowly on "top."

Surely such economical fuel consumption as above constitutes almost a record for a 3½ h.p.? E.M.

London.

A QUESTION.

Sir,—I do not know if you think the following difficulty worth putting before your readers.

Machine: 1912 Triumph with senspray carburetter. Symptoms: Misfiring at all speeds. Temporary cure: "Tickling" the float.

I rode like this nine miles, and then dismantled the carburetter and found all in order, *i.e.*, pipe free, needle not sticking, passage to jet and jet clear, no water in fuel. On reassembling the trouble had not disappeared. I thereupon took out the plug and found the central electrode broken off short, leaving a gap of ⅛in. or rather more. I put in a new plug and the trouble was gone. Why should flooding the carburetter stop misfiring from a faulty plug?

(Rev.) J. M. PHILPOTT.

PILLION RIDING.

Sir,—As a regular reader of your paper and a keen devotee to the pastime of motor cycling for many years, I regret to hear that the Town Council of Oswestry has sent a petition to Parliament begging it to make the practice of pillion riding illegal, on account of the accidents caused thereby.

I should like to ask why this practice should not continue? Is it not dangerous to cross the streets of London where there is no refuge? Then make it illegal to do so, except where there is one! Are not boating accidents frequent occurrences? Then why not make it an offence to boat unless one rows oneself?

What a boon the pillion seat is! Whether to take one's friends for rides or to give an acquaintance a lift to the station, or it may even be used to take a stranded motorist home.

And now it is suggested that motor cyclists should be compelled to become selfish individuals, content with their own company, unless they are burdened with a sidecar.

But who will take a sidecar? The owner of a low-powered machine will not, and the average person just "demobbed" certainly will not. He is a sportsman out and out. He has fought as such, and has been catered for as such. His mount is a 3½ h.p. single or a "big twin" geared very high, and with no consolation prizes such as gears or kick starters; in short a "sportsman's mount," which is not suitable for sidecar work. He wishes to take a passenger, and yet he is expected to ride alone or give up his machine for a "double purpose mount," consisting of gadgets and etceteras, with a power unit tucked away as though it were only a useful adjunct to the whole.

Since Easter I have ridden over 2,000 miles with sixteen different passengers on the carrier without even a near shave, and I have exceeded 50 m.p.h.

I can honestly say that I have never seen an accident occur to a person on the carrier of a motor bicycle, though I have seen accidents to persons on the step of a push bicycle, including accidents to my own person and that of the passenger on my own step.

A REGULAR FLYING OFFICER (PILOT).

Chobham.

PULLEY GRIP.

Sir,—I note the letter from Messrs. Grado, Ltd., in your issue of May 1st. I should like to draw their attention to the fact that I never disputed the fact that the "belt does actually pull the pulley flange inwards (due to the curved slot)." On my gear this action is so powerful that, when lowering the gear with the throttle well open, I have to switch off momentarily, otherwise the gear handle cannot be moved. What I *did* dispute was the claim that this action increased the grip on the belt. I pointed out that it really only resulted in a greater thrust on the control ring, and not on the belt. I effected a vast improvement on my own gear, first, by fitting two ball races—one each side of the control ring—and, secondly, by drilling $\frac{3}{16}$in. holes to a depth of about ⅛in. in the pulley flanges. I did not drill right through, for fear of weakening the flanges. Provided these holes are cleaned out periodically the belt shows no sign of slip, even in the lowest gear and the bottom part of the belt nearly on the ground.

GRADUATE.

GOVERNMENT MOTOR CYCLES.

Sir,—With reference to the motor cycles being offered for sale at the Agricultural Hall, I think it my duty to point out the difference in the catalogue description now being made, as compared with the description for the previous lots. Originally the machines were described as new, and were understood by the buying public to be this, but now we find that they are described as "unissued." An an example of a machine I recently bought, I would like to point out that the front tube is second-hand, having some eleven patches thereon, and, unfortunately, is badly perished. The majority of the tyres, even if new, are always so badly perished that they are unfit for more than a hundred miles running, whilst such things as magneto, mudguards, etc., are likewise badly second-hand. In fact, I frankly believe that, without any means of confirming this, the whole of these machines are all second-hand, and are being sold after overhaul. Considering that the Government were supposed to be putting an end to profiteering, is it quite reasonable that they should be allowed to mislead the public, with the result that they are paying between sixty-three to seventy guineas for second-hand 1914, 1915, and 1916 Douglas machines? A close examination of any of the models that have recently been offered at the Agricultural Hall will verify these statements.

London, W. RETYRED HURT.

REASONS FOR RETIREMENT.

Sir,—May I make a suggestion through your journal? In big compctitions like the M.C.C. Edinburgh and similar events every competitor who falls out of the run should be compelled to state a definite reason as to the cause of his failure to the club, and this to be published in the official club report and the press.

For instance, we note in the recent run, "So and so mysteriously disappeared." This ought not to be, but a genuine and truthful reason should be stated, so that the public can draw its own conclusions as to the qualities of the various makes of machine under test.

May I take this opportunity of congratulating the committee of the Motor Cycling Club on the excellent organisation of the recent run, and the enthusiasm it displays on behalf of the movement. A. C. ROBBINS.

A HEAVY TWIN AS A SOLO MOUNT.

Sir,—I have ridden the road from Acton to Uxbridge several times on a solo Harley-Davidson with a passenger on the bracket. Your correspondent must be very solicitous for the welfare of his 'bus if he gets off to push it over the bumps. I will say, though, that the last time I rode it I brought a sidecar back with me, and the fearful bumps broke the rear connection. I had to ride it side-saddle then to prevent my leg being pinched, under which circumstances the hand clutch came in particularly useful. (I sent the passenger on by train.)

I have ridden over bad roads round Uxbridge with three up solo (one on the tank), and even with the dead jars one gets on striking a 12in. hole I have not seen anything give way so far. I rode from Coventry to Uxbridge last week in two and a half hours solo.

The only trouble with a heavy twin is lifting it on to the rear stand. Two small wheels to let down from the footboards seem to me to be the thing needful, and I do not think that they should come under the head of unnecessary gadgets. H. IBBOTSON, Lt. R.A.F.

A 'VARSITY T.T.

Sir,—I read, with great interest, Mr. Millett's letter in which he proposed that a 'Varsity T.T. should be inaugurated.

He makes specific mention of Oxford and Cambridge, but, I take it, entry would be open to students of all the British 'Varsities. We might be able to judge, from the results, as to whether or not a Cambridge medical degree equals that of Glasgow, etc.!

Re the date: I do not know how they work things in England, but we, up here (Glasgow), have degree examinations in September, so that I suggest the end of July or beginning of August (preferably the former) would be more appropriate.

Could not this brilliant scheme be carried still further, and let us have a "'Varsity Scottish championship" similar to the Scottish championship of pre-war days, which was "run off" annually on the sands of St. Andrews? And, I earnestly ask, is it too late or too difficult to organise *this* this year?

JOHN W. WALKER.

Sir,—I have no doubt that the suggestion of your correspondent, Mr. H. Millett that an Oxford *v.* Cambridge motor cycle speed event should be inaugurated will be widely welcomed.

Probably both Universities would enthusiastically support such an event, and it might eventually become an annual fixture on a par with the Oxford *v.* Cambridge boat race. By that time records might be so far reduced that the contest would have evolved into a track event. A road race approaching the condition of the T.T. would probably be too ambitious for exclusively amateur riders, but there should be no doubt of the success of a contest restricted to two laps of the I.O.M. course, and run under the auspices of the A.C.U.

I am glad to see that Mr. Loughborough favours the proposal, and considers it practicable to promote the initial event during the long vacation next year. Probably a good many who are not usually interested in motor cycle racing would be glad to see this sport included in the annual inter-'Varsity contests.

As Mr. Millett suggests, the event would certainly bear the hall mark of sporting amateurism; and, being unique in its way, might provide a stimulus to amateur sport generally.

OSCAR E. SEYD.

THE ARBUTHNOT TROPHY.

Sir,—May I remark on the rules of the Arbuthnot Trophy, which appeared in *The Motor Cycle* of June 5th?

It would seem that the most sporting elements of motor cycling—the fixed geared machines—are washed out by the slow hill climb.

A fixed engined 4½ to 1 cannot beat a 15 to 1 bottom gear and clutch on a slow climb. Also it would appear that the other sporting effort in fast climbs—the speedy jump start—has no advantage with the slow climb coming first.

Cannot these already handicapped athletes be given a better chance; or must we spend our prize money on a hundred guinea three-speeder?

I feel sure that the gallant officer, whose name the trial commemorates, would think but ill of such regulations.

Cambridge. FIXED ENGINE.

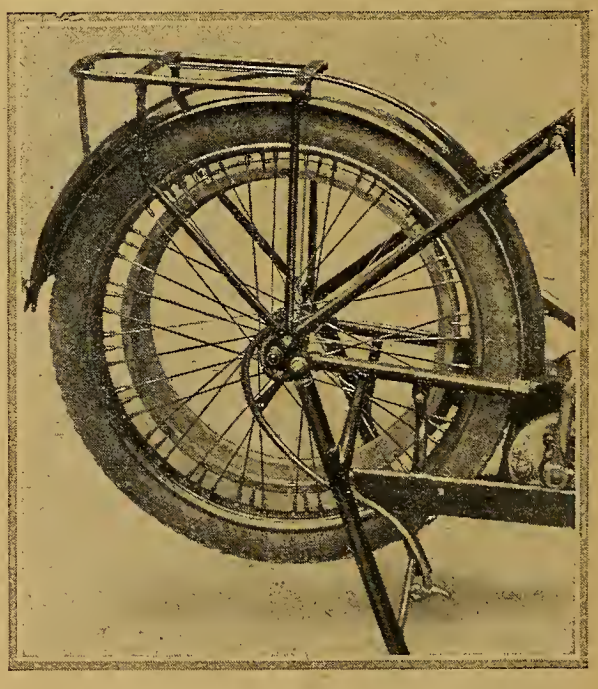
INFORMATION WANTED.

Sir,—With reference to Mr. Guthrie's letter and Mesopotamia, there is plenty of business to be done there with the Arabs, but, if he intends going up country, let him make the journey by one of the many river boats. He will be able then to make the journey in comparative comfort, be able to drink his iced soda water on deck and under an electric fan, and thank his lucky stars that he is not one of the engineers down below.

I have only just returned from the land of the three D.'s, viz., dates, dust, and dysentery, and it was then 102°, and this year it is predicted to be another 1916, so, with luck, the thermometer will show 132° again. It is not worth paying freight out on a motor cycle considering the little time and distance one can use it. Get to know an Arab, and, for a little cash, he will supply a motor cycle, or anything else, and relieve you of it the next night!

Mr. Kelk is quite right about the ten-day river trip from Basra to Baghdad on the average steamer, but what about the General's "Bint," which does the trip against the stream in thirty-five hours and down river trip in thirty hours, and uses on an average two dozen sparking plugs?

Wandsworth Common. W.F.D.



AN EXTRAORDINARY ROAD OBSTACLE.

Recently a Triumph rider "picked up" a length of ½in. round iron which once had formed the handle support of a perambulator. This caught in the spokes and wound round the hub as shown above, but did not unseat the motor cyclist, and only broke one spoke.

PRICES AND PRINCIPLE.

Sir,—Manufacturers are surely tightening the cord around the neck of the goose that lays the golden eggs.

Every one knows that the high priced machines are good 'buses, but the leading makers are losing sight of the fact that *most* machines on the market to-day are excellent goods, and any maker of the lower priced machines who can resist the almost overpowering impulse to raise prices because for the moment the motor cycle purchasing public has sun-stroke will in the end reap inestimable advantage.

I believe the A.B.C. will be a great machine, and I ordered one early on at £70. I withdrew at £85, *though I could afford to pay it.* I then ordered a 2¾ h.p. Douglas at £62, stuck the advance to £65, but now withdraw at £72. Moreover, my agent informs me that this machine at £72 is still only the W.D. model, and the price of the 1919 when it does appear will shock motor cycle buyers.

The Englishman is a peculiar breed; he will remember this season.

When I recently asked a respectable Birmingham agent why he did not advertise the A.B.C. and get deposits on it, he replied, "Because there can be none on the market for two or three months yet." I commend his reply to some of the advertisers of to-day.

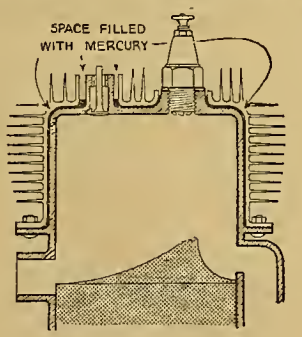
There are good machines at reasonable prices; there are agents out for respectable business. Let us stand by these and help to rescue the motor cycle trade from deserving the name for which it is fast qualifying.

The above two mentioned machines have been consistently and *deservedly* praised by *The Motor Cycle*, and we are prepared to pay too much for them, but the makers must not ask "three much."

A BUYER.

MERCURY AS AN AID TO COOLING.

Sir,—One frequently sees in your paper reference to attempts to use copper or aluminium jackets or rings as air-cooling, but difficulty is experienced owing to the unequal expansion of different metals under heat. Though I know very little about the subject, it has occurred to me that the jacket with rings might be made a *loose* fit, clearance, say, about $\frac{1}{64}$in., and the space filled in with *mercury*, which will allow for expansion and yet make a first-class conductor of heat.



A suggested method of using mercury as an aid to the cooling of engines. (See letter G. Madge.)

Conductivity of heat of cast iron = 507, conductivity of heat of aluminium = 966, conductivity of heat of copper = 2,085.

Water vaporises at 212° Fahr., mercury vaporises at 674° Fahr.

Therefore with four times' the heat conductivity of cast iron rings, even allowing for three times the heat, the mercury should not vaporise.

I do not know, but I hardly think that electrolitic, etc., action between mercury and copper or aluminium would be serious.

On the score of expense, so little mercury would be used in the $\frac{1}{64}$in. clearance that it would not be out of the way.

Can any reader tell me if it is feasible or has been tried?

G. MADGE, Major, R.E.

AN ECONOMICAL AMAC.

Sir,—From time to time I have been very much interested in the various devices tried by readers of *The Motor Cycle* in order to attain an economical consumption of petrol, and one which particularly took my fancy was a simple idea described by Mr. J. W. G. Brooker in the issue of April 6th, 1916. By inserting pins in the holes of his Amac he obtained 115 m.p.g. on a 3½ h.p. Rover. I have recently tried the same device and obtained 120 m.p.g. on a 3½ h.p. Alldays-Matchless, with sidecar attached. In my Amac there are five small holes above the jet, and in the three centre ones I placed ordinary pins, head downwards, and bent over at the top, cut off sufficiently to allow the carburetter slides to close. On Monday, May 5th, I travelled from Lincolnshire to West Hartlepool, a distance of 120 miles, with sidecar load of about five stones of luggage, and a slight rear wind. On previous occasions in the same journey, when riding solo, I usually refilled with petrol after doing about eighty miles, but on the last occasion I was agreeably surprised to finish the whole distance on *one* tankful of fuel. My tank is small, holding slightly under one gallon, and the fuel used was a mixture of benzole and No. 1 petrol (half and half). Owing to the bumpy surface of the roads in many parts, and several short halts for refreshment, I travelled at a moderate speed; my average for the whole journey worked out at 18 m.p.h. I found no difficulty in starting, and the only difference in driving was that, whereas I usually drove with air lever fully opened, on this trip it required to be only partly open on the level and closed a little on the gradients. My machine is a 1912 make, with the Roc two-speed hub gear, and I might mention that, in spite of its seven years' wear and tear, it runs as well as ever, though, naturally, not quite so silently. It is somewhat antiquated in many respects, but it still has the fascination to me of an old and well worn suit. What consumption it will give when used solo I have not yet tried, but I quite expect 140 m.p.g.

S. F. BRAY.

MOTOR CYCLE TRIALS.

Sir,—The M.C. and A.C. deserve every encouragement in its attempt to evolve a method that will "find a winner," and undoubtedly the rules the club formulated for its trial on the 28th ult. will enable the club to dispose of its awards without difficulty, but whether satisfactorily remains to be seen.

The deciding factor apparently is to be the flexibility test, somewhat on the same lines as adopted by the A.C.U. in the 1913 Six Days Trial.

Our criticism of this method is that it will not in practice enable a satisfactory comparison to be made between the different machines. For instance, if we have read the regulations correctly the following performances will be bracketed equal:

Slow portion.	Fast portion.	Figure of merit.
1 m.p.h.	20 m.p.h.	20
2 m.p.h.	40 m.p.h.	20
3 m.p.h.	60 m.p.h.	20
4 m.p.h.	80 m.p.h.	20

We take it that nobody would consider these performances equal in merit, and suggest that, as 4 m.p.h., or at most 3 m.p.h., is slow enough for all ordinary purposes, one or the other of these speeds should be taken as the "lowest possible" for the slow portion.

A further criticism is in regard to the method of equalising the figures of merit for the different classes. What we have in mind is that in Class A you may have a collection of real good machines all obtaining high figures of merit, whilst in Class B the majority make bad performances, with one outstanding exception. The ultimate figure of merit obtained by the winner in Class B will, under these circumstances, be much higher than that obtained by the winner of Class A, although the latter may be using a smaller engine, and may actually have put up a better individual performance.

A solution of this difficulty is not easy; but, in any case, would it not be wise to adopt a rule stipulating that a premier award will not be awarded to a machine if its individual performance shows a lower figure of merit than a machine in a smaller class? Another suggestion is that the average figure of merit should be based on the three best performances in each class.

GODFREYS, LTD.

Useful Books and Maps for Motor Cyclists.

	Price net.	By post.
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case	4/6	4/10
"HINTS & TIPS FOR MOTOR CYCLISTS." Full of useful "wrinkles" and little items of sound advice on the management, repair, equipment, and general care of a motor cycle. It will be found invaluable to all those who are thinking of overhauling their machines. *Sixth edition (2nd reprint)*	2/-	2/3

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4,
or of leading Booksellers and Railway Bookstalls.

,, 5th	... ...	9.47 ,,
,, 7th	... ...	9.46 ,,
,, 9th	... ...	9.45 ,,

Purchase of Motor Cycles by War Office.

Referring to the paragraph on page 649 in our last issue, Major A. J. Palmer of the Tank Corps points out that the 5th Battery of the M.M.G.S. (recruited from Coventry) were supplied with eighteen Enfield sidecar outfits, and that other batteries were supplied with Scotts.

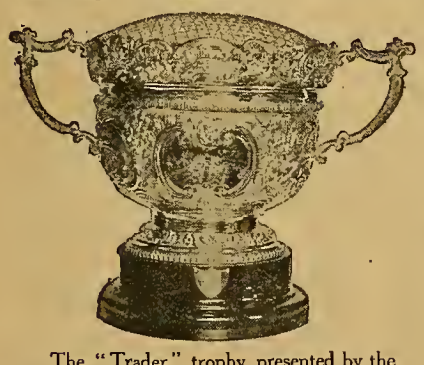
Col. Lindsay Lloyd.

Congratulations to Colonel Lindsay Lloyd, C.M.G., on his appointment to the important and responsible post of Assistant-Commissioner for Disposals in France. Colonel Lindsay Lloyd was well-known before the war to all who visited Brooklands, and did valuable work as Assistant-Director of Transport, Mobilisation and Embarkation Area, M.T., at Bulford, during the war.

Police Traps.

One of our readers informs us that he was caught in a police trap at Beulah Hill, Upper Norwood (Metropolitan police district) and also at Findon (Sussex) in the ten-mile limit.

We have also been informed that the police are working a trap just before reaching Tally Ho! Corner, Whetstone, mainly in connection with the use of cut-outs, number plates not being clearly visible, obscured, or dirty, and also examining the brakes.



The "Trader" trophy presented by the proprietors of our contemporary, *The Cycle and Motor Cycle Trader*, for the best performance on any solo machine of over 350 c.c. in the M.C. and A.C. Trial.

Our Hero Motor Cyclists.

A memorial service in commemoration of those gallant motor cyclists who gave their lives for their country during the war will be held at 3.30 p.m. on Friday, the 11th inst., at St. James's, Piccadilly, London, W.1. The service will be taken by the Rev. E. P. Greenhill. The Rev. B. H. Davies and the Rev. E. Hassard Short have been invited to assist.

The Edinburgh M.C. Hill-climb.

The Edinburgh and District M.C. is holding a hill-climb on Saturday next on Redstone Rigg, near Gifford. Ten classes have been arranged, six being handicap events and four scratch, so that almost every type of machine is being catered for. Hill-climbs have always been very popular among Scottish riders, and this event should attract a good entry. Messrs. S. L. Aitken and A. Bruce Lindsey, 6, Castle Terrace, Edinburgh, are the organisers.

To Promote Research.

The Research Association of British Motor and Allied Manufacturers is now practically assured. Promises of support have been received from a large number of the leading firms in the industry.

This Association is the first approved body of its kind to represent any section of the engineering industry, and will be governed by a council assisted by a committee of research men possessing high qualifications. The work of the Association naturally will fall under two heads, *i.e.*, research proper and the collection and organisation of scientific information bearing upon all questions which may subsequently become the subjects of research.

Open Hill Climb at Stile Cop.

There will be sixteen classes as follows:

Motor cycles: 1, up to 230 c.c.; 2, 230 c.c. to 275 c.c.; 3, 275 c.c. to 300 c.c.; 4, 300 c.c. to 350 c.c.; 5, 350 c.c. to 500 c.c.; 6, 500 c.c. to 600 c.c.; 7, over 600 c.c.

Sidecar machines: 1, Up to 400 c.c.; 2, 400 to 600 c.c.; 3, over 600 c.c.

Light cars: Under 1,100 c.c.

Scooters.

Three-wheelers.

In addition to the above classes there will be classes open to members of the club only for—

Light cars: From 1,100 c.c. to 1,500 c.c.

Motor cars (internal combustion): Open to any member who has never won a prize in any hill-climb.

Special Features.

THE CHEAPEST MOTORING FOR TWO.
HOT OR COLD INDUCTION.
NEW SCOOTER DESIGNS.

A Floral Carnival.

Wolverhampton is to hold a floral fête on the 9th and 10th inst. with events for motor cycles, both solo and with sidecars.

I.O.M. Customs.

Motor cyclist visitors to the Island are advised that they are required to take their machine registration papers, the receipt obtained on purchase of the motor cycle, and, if Customs Duty has been paid in England, a receipt for that also, as the Manx Customs authorities require to be satisfied that the machine was in England prior to its arrival in the Island, or that, if of foreign manufacture, the Import duty payable has been paid in England.

The Mont Ventoux Hill-climb.

The famous climb up the road to the summit of Mont Ventoux, organised by the Marseilles Motor Club, took place on Sunday last.

There was a fairly representative entry among the motor cyclists, many of them being French riders of British motor cycles, such as the New Hudson, Indian, Triumph, B.S.A., etc. The climb is a true test of power and reliability, as the hill has several hairpin bends, and is about nine miles long, with a culminating grade of about 1 in 4 covered with loose stones.

The M.C. and A.C. Premier trophy presented by Mr. C. F. Dawes (O.K. motor cycles), for the best performance, irrespective of class, in their 200 Mile Trial last Saturday.

The Bristo Rally.

Winners of prizes in the recent Bristol gymkhana should send their addresses to Mr. H. Smith, 6, Brynland Avenue, Bristol.

The Gjers Cup Trial.

A 200 mile day trial in the Lake District was organised by the Middlesbrough and District M.C.C. to take place yesterday, the 2nd inst., a feature of which was a one hour's interval at mid-day. The first competitor was due to start at 7.30 a.m.

Arbuthnot Trophy.

The following additional entries for the Arbuthnot Trophy have been received: No. 18, Lt. H. C. Dairns, R.M., 4 h.p. Triumph; No 19, Acting-Lt. A. G. Elliott, 4 h.p. Douglas; No. 20, Lt. D. F. E. Thompson, 3½ h.p. P. and M.; No. 21, Lt. J. S. Bethell, 2¾ h.p. Allon.

A New Two-stroke.

We are informed that the Calthorpe equipped with the new Precision two-stroke, lately described in our pages, which made its appearance in the Midland C. and A.C. trial on Saturday last, is being produced in quantity, and will be ready for delivery shortly.

Another Italian Race.

On the 23rd ult., an Italian event called Le Circuit d'Orbassano was held by the Turin M.C.C. over a distance of sixty-two miles. In the 350 c.c. class, B. Felice (2¾ h.p. Douglas) was first in 1h. 27m 1⅘s. The second man rode a Maffeis, and was 16s. slower than the winner; the third rode a Douglas.

The Maffeis made the fastest lap in 11m. 55⅘s.—about 46 m.p.h. In the 500 c.c. class, B. Pietro (Motosacoche) won in 1h. 6m. 50⅘s. A Della Ferrera started, but retired in the first lap. The regularity prize was won by Gianiolo (Fongri).

Speed Trials at Weston-super-Mare.

Capt. Philip Grout, of the Bristol M.C.C., informs us that application has been made to the A.C.U. for a permit to hold their postponed open speed trials on August 30th at Weston-super-Mare.

To Welcome Home D.R.'s.

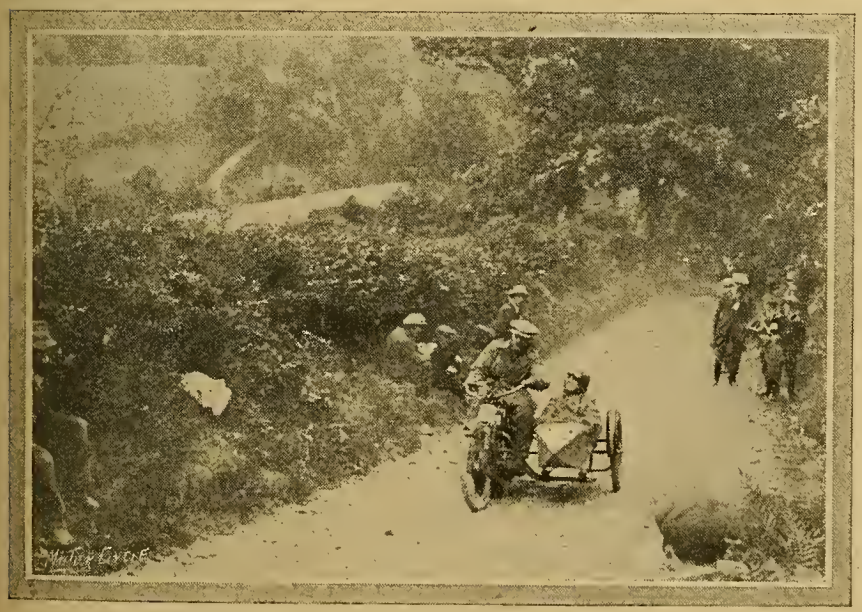
A movement is afoot in the Midlands to give a real welcome home to motor cycle despatch riders. A meeting is being held at the White Horse Hotel, Congreve Street, Birmingham, on Friday, the 11th, at 7.30, when representative heads of the trade, together with prominent motor cyclists, will discuss the question.

Government Motor Cycles.

A large number of new 2¾ h.p. Douglas motor cycles were sold at the three Government sales held last week at the Agricultural Hall, Islington, London, N.

The prices realised for these machines at the sale on Wednesday, June 25th, remained at approximately the same figures as at the previous sales, averaging sixty-eight guineas. At the following sale the auctioneer stated that there were only a limited number of unissued Douglas machines available, and hoped the prospective buyers would make their bids with this fact in mind. The prices obtained for these machines rose to approximately seventy and seventy-one guineas.

The lowest price, however, paid for one of these mounts was in the vicinity of sixty-three guineas, quite a fair price for war-stored machines. The sales of W.D. pattern 4 h.p. Triumph motor cycles were continued. First-class machines were bought, after considerable competition, for an average price of forty-two guineas, whilst the second-class motor cycles of the same make were knocked down for thirty guineas. Fourteen guineas was the amount paid for the third-class Triumphs, which was quite a good price in view of the appallingly bad condition.



MIDLAND CYCLE AND ATHLETIC CLUB'S TRIAL IN WALES.
Capt. J. L. Stocks (6-7 h.p. Ariel sidecar) on the lower portion of Alt-y-Bady.
(See pages 22 to 24.)

Atlantic Flight Hero and A.C.U.

Capt. Sir John Alcock, the Atlantic flight hero, wired to Bristol on the occasion of the recent "rally": "Wish every success to the A.C.U. As an old member, I consider every motor cyclist in the country should join."

Hill-climb at Garrowby.

The York and District M.C.C. held a successful hill-climb at Garrowby on Wednesday of last week, when C. S. Russell (3½ h.p. Norton) made fastest time. A. G. Kilner (2¾ h.p. Douglas) won the lightweight class, with two Coulson B machines second and third.

Officially Conducted Tests.

The Auto Cycle Union is now able and willing to undertake special trials and tests under its certified trial scheme, and invites applications from manufacturers who are desirous of submitting new models to officially conducted tests.

Stolen Motor Cycle.

Motor cycle thieves are still very active. A report reaches us that a B.S.A. sidecar outfit was stolen in Oxford last week. The machine is a 1919 Model K, engine No. 29043, frame No. 29152, with Millford sidecar and Easting windscreen fitted. Any information should be sent to the Chief Constable of Oxford.

Southend Speed Trials.

Arrangements are now being completed for this meeting, and that it will be a successful one is practically assured. A very large number of entries is anticipated, the motor cycle classes both being largely supported. In response to numerous applications, it has been decided to include classes for motor cycles with a cylinder capacity not exceeding 250 c.c. in the kilometre races for both standing and flying starts, and, subject to the number of entries being sufficient, a class for motor scooters of any size will be included. Entries positively close on July 8th by first post. Additional entry forms and full particulars may be obtained from the hon. organising secretary, Mr. Harold Fuller, 51, Pulteney Road, South Woodford, E18.

The £100 Runabout.

An innovation of direct interest to the sidecar enthusiast is promised for the autumn in the "Aero-car," a Bristol production which is a serious attempt to produce a runabout embodying the low weight, simplicity, and operation of a motor cycle.

We are given to understand that this miniature is to be built as a three-wheeler and a four-wheeler, and transmission will be by means of a belt or chain.

The power unit, it is expected, will be a horizontally opposed twin engine, 5-7 h.p., and the drive will be transmitted through a motor cycle type clutch to a small gear box. Two important novelties are introduced, the cooling being by means of a fan and cone in front of the bonnet, and the engine will be mounted on helical springs with the intention of eliminating vibration. The body is provided with side by side seats. It is hoped the "Aero-car" will be offered at £95 for the three-wheeler and £105 for the four-wheeler. The concessionnaires are the Beaufort Motor Agency, 26, St. Nicholas Street, Bristol.

A "LONG DAY" TRIAL.

Successful 200 Mile Event organised by the Midland Cycle and Athletic Club.

PROBABLY the most searching day trial held this year was the 200 mile event organised and successfully run last Saturday by the Midland Cycle and Athletic Club. Although comparatively new to the motor cycle competition field, the M.C. and A.C. is one of the strongest clubs in this country, and has the support of all the leading enthusiasts of road vehicles. A strong club is in the position to organise and carry out a motor cycle trial of an ambitious character, because it is sure of willing and capable helpers to act as officials. Hence the success of the first big trial of the M.C. and A.C., for the organisation, the arrowing of the course, and the conditions of the trial were all that could be desired. There was no confusion at any point, either on the part of officials or competitors; every observer had his duties clearly defined, and the working of the conditions eliminated the chance of misunderstanding on the part of the competitors. The riders were warned fifty yards before each test by prominent placards, and one mile from each check similar signs were displayed.

The first of the seventy-one competitors started at 6 a.m. from Griffin's Hill, Selly Oak. About five miles from the start, it came evident that considerable driving skill would be required. The first tests were a couple of hairpin turns, the second of which presented read difficulties to both solo and sidecar riders. It consisted of a steep drop, followed by a turn to the left, and an immediate rise of 1 in 8 or so to the top of the hill. This corner would never be taken in the ordinary course of things, for the two roads were joined by a curve overlooking the corner, and making an excellent place from which to view the attempts of the competitors. The turn being to the left increased the difficulties of the sidecar drivers, and more than one overturned, while the rough road and the sharp corner made it difficult for the soloists to keep their feet off the ground. No marks were lost here, but two extra were given for a successful turn, and many riders performed excellently, H. B. Denley (8 Morgan), E. Williams (2¾ A.J.S.), holder of the Junior T.T., and J. Allday (3½ James) being conspicuous.

Scene in Llangollen cattle market, used to park the competitors' machines during the breakfast and luncheon intervals.

A few miles through narrow lanes brought the competitors to Hagley Wood hill, where the fast and slow test was held. The road was little more than a cart track, very loose with dust and stones, and the test took place near the top of the hill after a certain amount of climbing had been done. About a mile along a track on the hillside, where it was often better to leave the so-called road and ride on the grass, brought the competitors to the "stop and start" test. This was almost on the summit of Clent Hills, where the gradient was somewhere in the neighbourhood of 1 in 6, the surface consisting, for the most part, of loose earth and grass. Several failed owing to wheel slip, but many good performances were made. E. Williams (2¾ A.J.S.) and H. B. Denley (Morgan) were again excellent, as were also J. Doherty, jun. (4 Triumph), G. E. Stobart (4¼ James), and H. J. Stretton Ward (4 Triumph).

Eighty Miles before Breakfast.

After these tests the competitors turned their wheels to Llangollen, where breakfast awaited them, through Bridgnorth and Shrewsbury.

The first competitor, after covering eighty miles of the course, reached Llangollen at ten o'clock, where excellent arrangements had been provided for the parking of the machines in the cattle market adjacent to the Town Hall—the official breakfast room.

Here, an interval of an hour was included, but, before the last competitor had arrived at one gate, the earlier members were being despatched from another. An examination of the check sheets revealed that eleven competitors had failed to reach Llangollen.

The second section of the trial was the most strenuous, and several long steep gradients had to be negotiated, including

R. C. Atcherley (4 h.p. Triumph) picking his way up Alt-y-Bady. Note the surface and the farm horses, which caused some excitement by appearing on the hill at a critical moment.

F. Stevens (6 h.p. A.J.S. sidecar) entering the Llangollen control.

Pentredwr, Tan-y-Bwlch, and Alt-y-Bady Hills. Tan-y-Bwlch is a long, rough, and narrow lane, with several awkward bends. It did not present any great difficulty to modern machines, and even the little two-strokes, after over two miles of grinding low gear work, surmounted the crest without signs of undue fatigue. The descent on the other side of the hill was exceedingly rough, and as narrow as, and steeper than, Jacob's Ladder, in the last English Six Days' Trial.

The Brake Test.

The only point in the whole trial which we are constrained to criticise is the brake test. Towards the bottom of this Welsh "Jacob's Ladder," the competitors were called upon to stop their machines in a given distance. Failure to pass this test entailed absolute disqualification from the trial. In the rules and regulations, it was stated that this test would be imposed upon a descent dangerous to poorly braked machines, and, having traversed the descent ourselves, we know that the hill was of the nature mentioned. We think the test should have been made on the top portion of the hill, as any machine which could safely descend to the officials already had proved the efficiency of its brakes. A machine inadequately braked would not have reached the testing place undamaged. The hill had a river bed surface; locked wheels produced landslides, and a brake test at the bottom of the hill is tantamount to locking the garage door after the motor cycle has been stolen. It testifies as to the quality of the brakes on the machines that only two competitors failed in the tests.

Two miles beyond this hill the competitors were faced with the *pièce de résistance* of the trial—Alt-y-Bady—a long rough tiring hill with a surprise corner, upon rounding which the riders found a hundred yards of about 1 in 3½. The hill at this point is fairly wide, but exceedingly rough, and, owing to the slate and rock-strewn surface, practically unclimbable in wet weather. Probably it is the "worst" hill ever included in a day trial—in fact, we cannot call to mind any trials hill in England which is quite so bad. Before the war the inclusion of such a hill probably would have brought forth vigorous protests, and on examining the hill one at first thought that it should be placed in the category of freak hills; but when one considers that there are dwellings which can only be reached by this hill, and that it is the direct road from Llangollen to Glyn Ceiriog, and saves a twelve-mile detour, one agrees that such hills are quite justified.

As was to be expected, a large crowd of spectators had assembled to witness the climbs of the competitors, and until the first dozen riders had ascended it seemed that no sidecars would succeed in climbing Alt-y-Bady.

In reviewing the performances of the riders, it is interesting to classify them according to the power of their machines, dividing the machines into three classes. (1.) Lightweights (under 350 c.c.), (2) other solo machines, and (3) sidecars.

Lightweight Performances.

It is perhaps scarcely fair to compare the respective performances of 350 c.c. singles and twins with those of 200 c.c. two-strokes, but, since some of the latter came near to equalling the performance of the larger type, it may be permissible to include them all under one heading.

The only lightweight rider to make a clean ascent was Eric Williams on his 1913 2¾ A.J.S. (a similar machine to that upon which he won the 1914 Junior T.T.). Kuhn (2½ Levis) touched the ground with one foot. This did not appear necessary, however, and he soared to the top in the usual Levis way. H. Newey, the other Levis rider, helped with his feet, but otherwise made a good ascent.

Hall (2½ O.K.), Bown (2½ Bown-Villiers), Clulee (2½ New Imperial), Taylor (2½ New Imperial), Phillips (2½ Allon), Hollyoak (2¼ Radco), Greaves (Calthorpe-Precision), and Gibb (2¾ Douglas) all elected to run beside their machines, while Newman (2¼ Ivy), Johnson (2½ Allon), Hartwright (2½ New Imperial), Abbott (2½ Diamond), Vale (2¾ Douglas), and Ford (2½ Diamond) stopped. Abbott, however, made a really good climb up the worst portion of the hill, failing within sight of success. Gibb chose the looser side of the road, and hit two rocks in quick succession which stopped his engine.

Solo Performances.

In the larger solo class, the majority succeeded in negotiating the hill without assistance. Dowler (3½ Sunbeam), Sealey

J. E. Greenwood (8 h.p. Sunbeam sidecar) making the fastest sidecar ascent of Alt-y-Bady

A "Long Day" Trial.—

(4¼ B.S.A.), Enticknapp (4 Blackburne), Dance (3½ Sunbeam), Strange (5-6 James), Choldcroft (4 A.J.S.), Stobart (4¼ James), Peck (3½ Ariel), J. A. Newman (3½ Sunbeam), Doherty (4 Trinmph), Stretton Ward (4 Triumph), and Dudley (3½ Sunbeam) all made clean ascents.

Stobart ran into the bank, but made a splendid recovery. Doherty made what was probably the fastest ascent; in fact, he made a consistently good performance throughout the trial, and had the hard luck to burst a tyre ten miles from the finish.

Just before the last of the competitors ascended the hill, some excitement was created by the presence of six farm horses appearing at a critical moment. Stretton Ward skilfully threaded his way through them and earned the applause of the spectators.

Watson-Bourne (4 Blackburne), Atcherley (4 Triumph), and Jackson (6 L.M.C.) used their feet, the last named probably on account of having to avoid another competitor who had stopped.

Minton (4 Norton) and Boynton (5-6 James) stopped, the former in avoiding a stranded competitor ran into the bank, while Boynton was brought to a standstill with his wheel spinning. He made a successful restart on the worst part of the hill.

Duke (4 Triumph) was a victim to over cantion. He carefully picked his way up the hill, but took too wide a sweep in avoiding one particularly loose patch, and skidded and fell.

The Sidecars on Alt-y-Bady.

Giles (6 A.J.S. sc.) was the first sidecar to make a clean ascent. Frank Smith's new 8 spring frame Clyno made a steady climb, with ample reserve of power, as did Capt. J. L. Stocks's 6-7 Ariel. J. E. Greenwood (8 Sunbeam) made the fastest sidecar ascent, and Denley's Morgan climbed steadily. Amongst the sidecar machines probably the most praiseworthy performances were those of Oreton and L. Newey on 3½ Ariel sidecars. These two machines, with engines of only 500 c.c., made excellent climbs. Watson on a similar machine also ascended the hill in good form, but on the 1 in 3½ portion his belt broke. Oreton and Newey were the only riders of single-cylinder sidecars successfully to negotiate the hill. Woodcock (5-6 Ariel sc.), Dalby (4 Trinmph sc.), and Arch (8 New Imperial) were brought to a standstill with spinning rear wheels, while Cutler (4 Norton sc.), Heather (4¼ B.S.A. sc.), Norris (8 Royal Ruby), Bird (4¼ B.S.A. sc.), W. Urry (4¼ B.S.A. sc.), and Grinton (8 Harley-Davidson sc.) also stopped. Grinton's Harley-Davidson had the sidecar on the right side of the machine, American fashion, and, as it happened, this would have favoured him on the hill as the very loose patches had to be traversed by the driving wheel of the conventional sidecar.

After this hill the competitors had to descend a very severe gradient into Glyn Cerriog, which was very rough and trying to men, machines and sidecar chassis. A further thirteen miles and the riders were back again in the market yard for the luncheon interval of one and a half hours.

Seventy Miles on Main Roads.

At 3.30 the first competitor was due to start in the third and last section of the trial—a straightforward main road run of seventy miles to the finishing point at "The Parson and Clerk," Streetly, where forty-nine survivors of the hard day's gruelling were checked in.

It was an excellent trial, and we heard many competitors congratulate the officials upon its sporting nature. We, too, congratulate Mr. F. J. Urry, the hon. trials secretary, and his many willing officials on the manner in which the trial was run.

The following handed in their cards at the finish :

A. J. Dowler (3½ Sunbeam)
L. L. Sealey (4¼ B.S.A.)
A. S. Ward (6 Enfield sc.)
N. Hall (2½ O.K.)
J. A. Watson-Bourne (4 Blackburne)
H. P. Cutler (4 Norton sc.)
P. J. Enticknapp (4 Blackburne)
G. Dance (3½ Sunbeam)
D. S. Heather (4¼ B.S.A. sc.)
H. Newey (2¼ Levis)
G. N. Norris (8 Royal Ruby sc.)
G. Knhn (2½ Levis)
F. W. Giles (6 A.J.S.)
W. A. B. Bown (2½ Bown-Villiers)
Frank Smith (8 Clyno sc.)
P. Newman (2½ Ivy)
C. Hollyoak (2¼ Radco)
F. Stevens (6 A.J.S. sc.)
C. Hartwright (2¾ New Imperial)
J. Dudley (3½ Sunbeam)
W. Woodcock (5-6 Ariel sc.)
L. E. Clulee (2½ Allon)
P. L. Taylor (2½ New Imperial)
C. Oreton (3½ Ariel sc.)
A. H. Johnson (2½ Allon)
W. Jackson (6 L.M.C.)
E. Arch (8 New Imperial)
G. A. Strange (5-6 James)
H. Minton (4 Norton)
L. Newey (3½ Ariel sc.)
H. Phillips (2½ Allon)
J. E. Greenwood (8 Sunbeam)
E. W. Choldcroft (4 A.J.S.)
F. J. Watson (3½ Ariel sc.)
G. E. Stobart (4¼ James)
H. B. Denley (8 Morgan)
G. A. Dalby (4 Trinmph sc.)
J. A. Newman (3½ Sunbeam)
T. Peck (3½ Ariel)
S. T. Abbotts (2¼ Diamond)
T. B. Vale (2¾ Douglas)
J. G. Orford (2½ New Imperial)
E. Williams (2¾ A.J.S.)
J. Allday (3½ James)
J. L. Stocks (6-7 Ariel sc.)
H. Boynton (5-6 James)
G. Grinton (7 Harley-Davidson sc.)
H. Greaves (3½ Calthorpe-Precision)
H. J. Stretton Ward (4 Triumph)
R. C. Atcherley (4 Triumph)
W. B. Gibb (2¾ Douglas)

A Passenger Machine Trial on Touring Lines.

The Birmingham M.C.C. will run the Midland cup trial on touring lines. Freak hills, speed-judging, and flexibility tests will be excluded. We are informed that the conditions will provide for eventualities which usually occur on a tour.

Glasgow Western M.C.C. Slow Hill-climb.

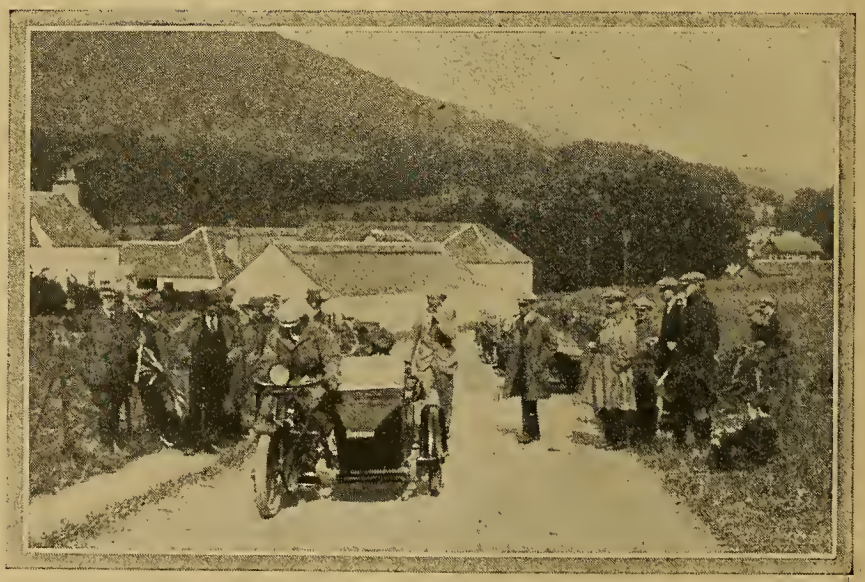
An Impromptu Test.

THE Western Clnb of Glasgow were due to hold an old crock hill-climb on Satnrday last, bnt owing to the non-appearance of the old crock the members of the clnb present at the rendezvous ran off an impromptn slow climb instead.

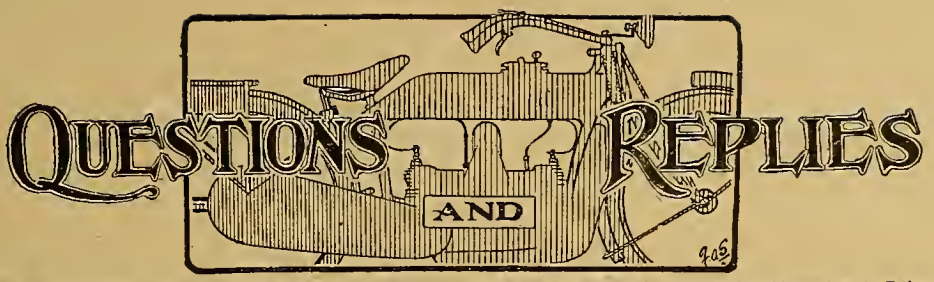
There was quite a large turnont of members, and several good ascents were made, the most notable being E. M. While (6 h.p. A.J.S. sc.) and I. Barclay (6 h.p. A.J.S. sc.).

Owing to the small nnmber of solo riders present, a solo class was not run off. J. Connal on a 2 h.p. Victoria-Precision put up a very fine performance.

The reason of the non-appearance of the old crock was due to the fact that when about to leave for the venne the engine refused to start, although the previous evening everything was going well. In all probability, however, the event will be rnn off later in the season.



Glasgow Western M.C.C. slow hill-climb at Cult Brae. J. Henderson, 4 h.p. A.J.S. and sidecar, starting the climb.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Raised Prices.

I ordered a new motor cycle from an agent, and was promised delivery in four or five weeks. I now have a letter from the agent saying the price is raised by £7, and enquiring if I will confirm the order. Is it the practice of the trade to raise the price of a motor cycle after it is ordered at a certain price and past the date of delivery?—W.B.

Deliveries are so uncertain at the present time, and it is frequently necessary for prices to be advanced on account of the fluctuations of the raw material market. Whether you will have to pay the increased price depends on whether you have a definite written quotation from the agent. If so, you can hold him to that price.

Misfiring.

I have a 1914 8 h.p. Rex sc. outfit. (1.) The front cylinder misfires about once in every four revolutions when travelling at slow and high speeds. When travelling at about 20 m.p.h. this does not appear to occur. The plugs are clean, as are also the carbon brushes, and the make and break are quite efficient. What is the cause of the misfiring? (2.) I have a B. and B. carburetter which chokes the engine when the throttle is opened more than half-way. Please tell me the cause and remedy. (3.) The oiling system is by pump and semi-automatic drip feed, but I cannot get the oil to drip. The only way to feed oil to the engine is by means of the hand pump, which is incorporated with the oiler. The crank case has a breather pipe, which I have stopped up, thinking that this would give me suction in the crank case and thereby draw the oil down. Instead of suction the crank case seems to be blowing out. Should there be a valve in the union joining the oil pipe to the crank case, and is it necessary to have a breather in the crank case, as oil is thrown all over the machine? I have thoroughly cleaned the pump and all the parts of the oil system but still cannot get the oil to drip.—F.J.W.

(1.) The trouble may be due to air leaks at the carburetter or induction pipe unions, or to the tappets requiring adjusting. Perhaps the jet is partially choked. (2.) Bad carburetter adjustment. Try fitting jets of different sizes. (3.) The oil will not feed to the engine unless the pump incorporated with the oiler is put into action. You would serve no useful purpose by stopping up the breather pipe. There should be no valve in the union. The object of the breather is to release the crank case compression, and prevent oil being thrown out through the bearings.

Loss of Compression.

The compression on my 2¾ h.p. Douglas is not good, and on turning the flywheel by hand when cold there is a hissing noise as of air escaping. It improves when hot. I presume new piston rings are necessary, but do not want the bother of fitting them just now. (1.) Does it harm the engine to run in this condition? (2.) Is petrol consumption of about one hundred miles to the gallon satisfactory? My weight is 9 stone 10 lb.—G.J.B.

(1.) We do not think it will harm the machine at all to run it in this condition. The engine is a low compression one, and depends upon its high engine speed for its power. The leak may not be at the piston rings, but may be at the valves or valve caps. Also make sure that the tappets are adjusted correctly, and see that the valves are closing properly. (2.) The petrol consumption is highly satisfactory.

F.N. Parts.

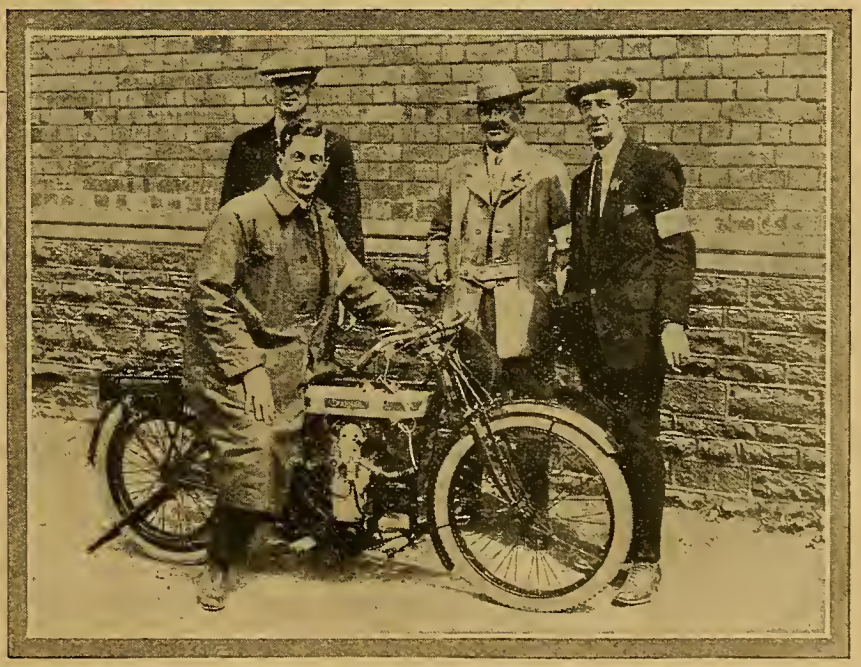
I should be extremely obliged if you would be good enough to inform me where I can obtain spare parts for a 2¾ h.p. F.N. two-speed motor cycle.—E.W.W.

Write F.N. (England), Ltd., Kimberley Road, Willesden Lane, Kilburn, London, N.W.6.

Deposit Refund.

After having paid a deposit of £20 on a second-hand motor cycle, I find myself unable to obtain the other money necessary to complete the purchase. Can I claim my deposit back whole, or would the dealer be in order in selling the machine for less than I was going to pay for it, and deducting the difference from my deposit, or would I be compelled to have £20 worth of goods from him?—H.E.D.

You will either have to complete your purchase, or otherwise you are liable to pay damages. You could be sued for the balance of purchase money, or the owner could resell and deduct the difference in price (plus any expenses in connection with the resale) from the deposit.



Mr. E. B. Ware (A.C.U. Committee member) on the 2¾ h.p. Douglas he won for 10/- at the recent Bristol Rally.

Magneto Trouble.

[?] I should be obliged if you could help me out of the following trouble with a 2½ h.p. two-stroke Ixion-Villiers. I cannot get it to start. It will fire the mixture when pushed along with the compression release open (a good blue flame), but will not do so with the release valve shut. Carburetter, Amac, 29 jet, taken down and thoroughly cleaned out. Petroil lubrication, 16 to 1 (mixture taken from the tank of a similar machine, which runs well on it). Ports clean, compression good. Tried various good plugs. Magneto, Dixie, taken to pieces and properly cleaned, contacts clean and square, and correctly adjusted. Tried various plug gaps and different timing (fixed) from T.D.C. to ⅛in. before T.D.C. By pulling the back wheel over smartly I can only get a spark 3/32in. long from the end of the high-tension wire. The magneto condenser seems all right, as the points do not get burnt. There is no high-tension brush or collector ring on this magneto. The pinion wheel is bronze. How can I test the magnets to know if they require remagnetising? Do you consider this magneto a first-class one? —H.E.N.

Without examining your machine, we should say that the magneto current was too weak to provide the spark under compression, and we should advise you to submit the magneto to an expert. There is no easy method of testing the magnets. The magneto is quite good of its type and should give no trouble, particularly as you have a bronze sprocket.

Improving Old Machine.

[?] I have bought an old 3½ h.p. single-cylinder Minerva. (1.) Will this engine take a lightweight carburetter? (2.) The total height of the engine is 17in. Could this be built into a lightweight frame? (3.) Could a pair of Druid forks be fitted to the present Minerva frame? If so, what measurements would be required? (4.) In the bottom frame there is a bracket with a spindle similar to a pedal cycle. No very long cranks could be fitted, as there is very little clearance. What was this probably used for? (5.) The engine is believed to be a 1913 one. How can I know for certain? (6.) The height from the top of the saddle to the ground is 33in. Would this be termed high, medium, or low? (7.) The B. and B. carburetter has a pipe screwed on the chamber where the slides are in. What is this for, and should the carburetter be pushed home on the induction pipe or just fastened on the end?—W.S.

(1.) The carburetter should be one made for a 3½ h.p. engine, otherwise you will not get full efficiency. In any case, we do not think the induction pipe union would be large enough on the lightweight carburetter. (2.) There is no fixed definition of a lightweight frame. The frames for various lightweights differ in many particulars, and the only way to judge whether your engine could be utilised in such a frame is to measure the height, and the distance between the plates at the bottom bracket. (3.) You could fit Druid forks. Measurements will be diameter of wheels and length of steering head. You should also give weight of the machine. (4.) The bracket in the frame may have been used for footrests. (5.) There was no Minerva engine made in 1913. The engine was made on the Continent, and there are no British agents, so that you will have some difficulty in determining its age. (6.) The saddle height is decidedly high. (7.) The pipe to which you refer may be intended to improve carburation by making use of the inertia of the gases. In fitting the carburetter, care should be taken that no air gets in the induction pipe joint. This should therefore be fitted on as far as possible and well tightened up.

EXPERIENCE WANTED.

"B.W.C." (Chelsea).—3½ h.p. Brough. Speed, reliability, consumption, etc.

"Scottite" (Eltham).—The substitution of the petroil system of lubrication for the standard oiling arrangement.

READERS' REPLIES.

The Low-tension Magneto.

I notice a correspondent in your issue dated May 5th is in trouble owing to the difficult starting of his N.S.U., which is fitted with a low-tension Eisemann magneto. As I have had, in the past, some years on the road with these machines I may be able to help him. His trouble is undoubtedly due to glaze on the carbon brush of the magneto. If he takes off the fibre cover on the left hand side of the magneto, he will find a flat spring about 1½in. long which can be moved upwards; under this spring, at the end furthest away from the centre, will be found the carbon brush: this should be taken out and rubbed up with a piece of emery paper. When replacing, care should be taken to see that the tongue on the end of the spring is fitted into the slot on the end of the carbon brush. I have often found that these machines will go through a long run perfectly, but, after being allowed to stand a few minutes, will require the brush to be cleaned before a restart can be made. It may interest your correspondent to know that Messrs. Eagles and Co., of Acton Hill, London, W., can probably supply spares for these machines. I have always found the above firm most courteous, they do their best to satisfy the most exacting requirements. I have no interest in the above firm otherwise than that of a satisfied customer.—H. E. PORTER.

In reply to "A.W.G.M.'s" query in your issue of June 12th, 1919, I beg to give my opinion. We D.R.'s use all kind of oils in our Triumphs, but the smell referred to is that of castor oil, which we use when we can get it. It is the best oil we can get for summer use, but we have to thin it down in the winter with a very thin oil which is issued to us as winter oil. Most D.R.'s were unable to get castor oil except those who were well in with some of the R.A.F. During the last eighteen months I was attached to the Tank Corps, therefore I was able to get a good supply of castor oil, which I used most of the time and found it quite A1. The tubing mentioned makes the finest grips for Triumph handle-bars. I may add that I specially brought two pieces of this tubing home with me for use on my own bicycle. I have it now fitted to my 1919 Trinmph.—W. J. COOPER.

Difficult Starting.

I notice in your issue of June 19th a question asked by "O.T.H." *re* difficult starting of his 5-6 h.p. Indian. It is possible for him to get high-tension current with the system he has mentioned, with the exception that he should have a small resistance in series with the battery, so as to prevent a dead short on the battery when the contact breaker was closed. The fact of the magneto being alternating has no bearing on the matter, as the high-tension current depends on the interruption of the primary circuit in series with the battery through the make and break of the contact breaker. This system is used on the Maxwell cars, and is termed "plain duplex."—AS 174609.

RECOMMENDED ROUTES.

MIDDLESBROUGH TO MARYPORT.—J.L.

Middlesbrough, Stockton, Darlington, Barnard Castle, Brough, Applehy, Penrith, Penruddock, Keswick, Cockermouth, Maryport. Approximately 115 miles.

BIRMINGHAM TO CAMBRIDGE.—J.P.

Birmingham, Coventry, Daventry, Dunchurch, Northampton, Bedford, Eaton Socon, St. Neot's, Eltisley, Cambridge.

NEWCASTLE TO EXETER.—T.W.R.

By the route previously given as far as Stamford, then through Kettering, Northampton, Brackley, Oxford, Faringdon, Swindon, Wootton Bassett, Chippenham, Bath, Radstock, Wells, Glastonbury, Durston, Taunton, Wellington, Cullompton, Exeter. Approximately 393 miles.

BRISTOL TO EDINBURGH.—P.V.J.

Bristol, Stone, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Wellington, Whitchurch, Tarporley, Warrington, Wigan, Preston, Garstang, Lancaster, Kendal, Penrith, Carlisle, Longtown, Langholm, Hawick, Galashiels, Stow, Edinburgh. Approximately 350 miles.

BRISTOL TO ALWINTON.—P.V.J.

By the route we have given above as far as Penrith, then branch off through Alston, Haydon Bridge, Hexham, Hamshaugh, Wark, Bellingham, Yellow House Inn, Otterburn, Elsdon, Alwinton. Approximately 320 miles.

RAMSEY (HUNTS) TO LLANDUDNO AND BANGOR.—R.W.W.

Ramsey, St. Mary's, Holme, Stilton, Norman Cross, Chesterton, Water Newton, Wansford, Duddington, Glaston, Uppingham, Leicester, Ashby-de-la-Zouch, Burton, Uttoxeter, Stone, Pipe Gate, Audlem, Whitchurch, Overton, Ruabon, Corwen, Cerrig-y-Drnidion, Bettws-y-Coed, Llanrwst, Llandudno Junction, Llandudno. For Bangor branch off at Bettws-y-Coed for Capel Curig, Nant Francon Pass, Bangor.

MOTOR CYCLES FOR SALE.

A.J.S.

A.J.S. Spares; engine and gear box repairs; prompt delivery.—Cyril Williams, Chapel Ash Depot, Wolverhampton. T.A.: Parts. [1089

Alldays.

ALLON.—Caffyns, Ltd., Eastbourne, for delivery shortly. [0017

ALLDAYS-VILLIERS, 1914, 2¾h.p.; 30 gns.—290, Brixton Hill, S.W.2. [5306

GEORGE SMITH has 1919 Allon latest model in stock.—268, Lavender Hill, Clapham Junction.

1916 Allon, as new, little used; 48 gns.—George Smith, opposite Arding and Hobbs, Clapham Junction. [4009

1919 Allon 2-stroke, just delivered, at cost; £70/19.—C. Burlingham, Rossyvera, Evesham. [X5116

ALLON, 2-stroke, 2-speed, new piston, belt, and tyres; perfect; £49; after 6.—Parritt, 14, Stanhope Gardens, Highgate. [4792

ALLDAYS-MATCHLESS 1914 2-stroke, 2¾h.p., splendid running order; £32.—104, Plough Rd., Battersea, S.W. [5474

1916 Allon, 2 speeds, speedometer, horn, pump, tools; condition perfect throughout; £45.—Howard, 11, Ruskin Av., Kew. [X4794

1917 Allon, 2-stroke, new rear tyre, horn, tools; in splendid condition; stored 2 years; £50, cash.—11, Melrose Rd., Gainsborough. [X5081

JONES' Garage, special agents for Alldays Allon, Broadway, Muswell Hill, N.10, and Woodside Parade, North Finchley. [2931

ALLDAYS Allon.—Orders booked now will ensure early delivery.—W. R. Sanders and Co., Ltd., Sanders' Garage, Buxton. [X3645

ALLDAYS 1914 3½h.p. Matchless, 2-speed, Binks, Bosch, good condition; 48 gns. After 6 p.m.—16, Alfred Gardens, Southall. [5121

1917 Alldays-Allon, 2¾h.p., 2-speed, H.C.C., perfect condition, head, tail lamps, speedometer, mechanical horn; trial; £55.—Jenkins, Shenley, Bletchley, Bucks. [X4994

1919 Allon 2-speed, like new, and grey coach sidecar, £72, separate; 3½h.p. Ivy-Precision 2-speed, engine overhauled makers, £37.—Box 4,219, c/o *The Motor Cycle.* [X4935

ALLDAYS Combination, 4h.p., 2-speed rock gear, handle start, with coachbuilt step pattern sidecar, needs repairs; as it stands, £55.—Marlboro' Motors, St. Albans. 'Phone: 159. [5359

ALLON 1919 2¾h.p., clutch model, leg shields, 2-speed, free engine, averages 108 to 112 m.p.g., good climber, mileage about 500, will take a light sidecar; price £60.—E. J. Melsome, Arden, Nether St., North Finchley, N.12. [X5071

Antoine.

ANTOINE Motor Cycle, twin engine, and wicker sidecar, Bosch mag.; £25.—Box L2,337, c/o *The Motor Cycle.* [4875

ANTOINE 5-6h.p., Amac, Bosch, wicker sidecar, running order, mechanically sound; trial; £35; will separate; evenings.—108, Leslie Rd., E. Finchley, N.2. [5031

DELIVERIES.

We regret that as it is quite impossible for us to obtain definite information from manufacturers regarding supplies of motor cycles, we in turn are unable to give our clients more than approximate delivery dates.

It follows, however, that quite apart from our desire to fulfil the wishes of our customers, we are most anxious, for our own benefit, to obtain new machines, and are therefore using every endeavour to get deliveries on the contracts we have placed.

Our arrangements were made in good time with the manufacturers, and we offer you the advantage in delivery that this entitles us to. The machines enumerated below are those for which we hold agencies or have placed contracts, and we shall be pleased to give prompt attention to your enquiries concerning them.

The joys of motor cycling are manifold—but they are always associated with freedom from mechanical trouble. From the grateful manner in which hundreds have written thanking us for the prompt and thorough way we have repaired their

Sturmey-Archer

or

Armstrong Gear

We are justly conscious that we have done our part well.

RECOMMENDED BY THE STURMEY-ARCHER Co

We regret, however, through **heavy pressure on our works at the present time, we cannot undertake repairs at short notice, but you can rest assured that orders will be executed in strict rotation.**

COUNTY ENGINEERING Co.

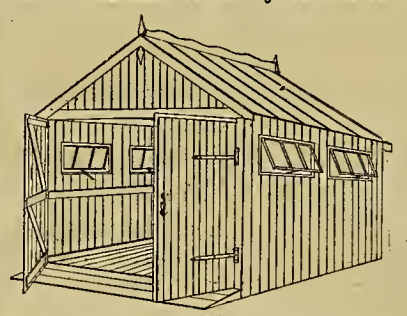
THE PREMIER MOTOR COMPANY,
ASTON RD., BIRMINGHAM.

Motor Houses and Cycle Sheds.



Built in five sizes, the three largest sizes made in sections which are mortised and tenoned together, a method of manufacturing which few makers adopt, but it will be evident to anyone that this method is infinitely superior to any other specification.

Specification: Built throughout from ⅞in. selected tongued and grooved and V jointed matchboards in sections as described, to bolt together. Strong double doors, full width of end-hung on extra strong hinges and provided with lock and key and Tower bolts for holding door in position, also handle to door. Range of fixed framed windows in either side, complete with glass, extra strong roof covered with best felt and battened down. Wide barge boards on each end of roof. Sloping platform in front of door to allow of easy access of Cycle or Motor.

Sizes: No. 1, 6ft. long, 5ft. wide, 6½ft. high, **172/6**, floor **35/-**; No. 2, 8ft. long, 6ft. wide, 7ft. high, **245/-**, floor **56/-**; No. 3, 10ft. long, 8ft. wide, 9ft. high **405/-**, floor **100/-**; No. 4, 15ft. long, 10ft. wide, 9½ft. high, **660/-**, floor **210/-**; No. 5, 20ft. long, 12ft. wide, 11ft. high, **890/-**, floor **300/-**. All carriage paid to nearest Station. Prompt despatch guaranteed. Inch boards 20 per cent. extra. See booklet for further particulars.

15ft.	12ft.	10ft	£36 0 0	£14 0 0
20ft.	12ft.	10ft.	£46 0 0	£16 0 0

All sent carriage paid in sections.

Sutcliffe's Motor Sheds are the strongest built, best designed Motor Sheds you can get at anything like the price; don't be tempted to buy weakly constructed Sheds, they are most expensive in the end. Study Sutcliffe's Construction:—Sides, ends, roofs built on ¾-inch best match boards, roof also covered with extra heavy felt, rainproof, framework of tremendous strength. All floors are double strength, will carry a ton or more weight easily. All houses erected and bored before despatch, all bolts supplied free. If any client is not perfectly satisfied, simply return shed and we refund purchase price. Full details in free booklet. Can rail any size in 2 to 6 days. **F. & H. SUTCLIFFE, 44, Wood Top, Hebden Bridge, Yorks.** *'Phone :—58, Hebden Bridge.*

MANCHESTER.
WHY have house and home turned into an Auction, dealing with numerous "probable" buyers, when your Light Car or Motor Cycle can be sold on commission at our Show rooms?
Upon receipt of a Post card our representative will call for your car or machine, and in due course a cheque for full amount, less our small commission, will be forwarded to you.

CHAIRMAN RHYMES.

Not once, nor twice
In Britain's story,
The path of Sport
Has led to glory.
So when I've learned
To drive the jigger
As fast as fire
Responds to trigger,
I'll smoke my Chairman
From the case
My bike has won
In some big race

5½d. for 10 *everywhere.*

[5402

NOT A Record

But the usual result of advertising in "The Motor Cycle."

The following is an unsolicited letter from Lt. S. B. Potter, R.A.F., Peebles, Scotland.

I HAVE, on more than one occasion, seen references to the value of your publication as an advertising medium. My own experience may be of interest to you; in fact, I should imagine it would almost constitute a record, even in these days of keen competition for motor vehicles.

In your issue of June 11th I inserted an advertisement of a standard 3½ h.p. clutch model Rover for sale, giving my home address (Essex) for purpose of communications.

The same evening as "The Motor Cycle" appeared (Thursday) I received the following wire from my parents, whom I had just informed of the fact that the machine was sold—

"Inundated telegrams, letters, callers re Rover. Query hoax. Explain."

I wired instructions re acknowledgments, etc., since when I have had forwarded all the correspondence from prospective purchasers.

It consists of some dozen telegrams (mostly reply paid) and nearly sixty letters and postcards from all parts of the kingdom.

So many people called personally that my parents were finally compelled to affix a notice outside the house—

Re Rover Motor Cycle
THE MACHINE HAS BEEN SOLD

The majority of the telegrams were despatched between 9 and 9.30 on the *morning* of publication, i.e., immediately the post offices were open.

Two gentlemen called in a car before noon, to take the machine away with them.

Several wires said "hold machine, am coming over now."

Comment on the whole affair seems quite uncalled for.

H. F. EDWARDS,
7, Exhibition Road,
SOUTH KENSINGTON,
beg to announce they have opened showrooms at above address, and have in stock
2¾ h.p. Douglas, New Enfield Combinations, lateat Models. 1915 4 h.p. Triumph. 1914 4 h.p. Triumph.

This price is paralleled, and engines can be secured on instalme if so desired. Send for official report and illustrati Takes a sidecar anywhere. All carriage must be when ordering. Send stamped envelope for replies. Sunday business.—Note address, Motoralities, Sweetman St., Wolverhampton. [5

A Coloured Contoured Map of London and the Home Counties.

The Autocar

Sectional Road Map
of
South-East England

Quite as useful to the motor cyclist as to the motorist.

¶ This map will be found invaluable to those whose travelling is confined mainly to the Home Counties, and especially useful to motor cyclists and car owners resident in or near London. By its aid a large number of interesting short tours, or week-end trips, can be arranged.

¶ It consists of eight separate sections, on strong card (size 10in. × 7½in.), with a map giving an index to the sections on the back of each card.

¶ The scale is four miles to the inch. Main and other first-class roads are distinctly marked in red, and the distances between towns are clearly shown. The contours of altitude are indicated in colours on each section.

¶ The area covered by this map embraces Aylesbury, Luton, and Colchester on the North; Portsmouth, Brighton, and Eastbourne on the South; Oxford and Winchester on the West; and Walton-on-the Naze and Broadstairs on the East.

The Transport Bill.

WE rejoice to notice that at last the failings of the Transport Bill, which proposes to place the roads of this country under the control of a man whose interest is admittedly in the railways, are becoming apparent to the general public. *The Autocar* and *The Motor Cycle* have pointed out the iniquities of this Bill with no uncertain voice more than once. Without going into the questions of the docks and the nationalisation of the railways, which subjects do not directly concern us, we may point out that motor transport, not only of goods but of the individual, has been important in the past, and is likely to become more important in the future, and that, without good roads, this transport is unnecessarily difficult, and in some cases impossible. Good roads, then, are of paramount importance, but we are doubtful whether the proposed Ministry of Ways and Communications will give them the consideration that is their due.

Pillion Riding.

THOUGH we do not consider that the taking of a passenger on a solo motor cycle carrier is either desirable or particularly safe, we cannot agree with the policy of several district councils in asking the Government to make carrier riding an offence under the Motor Car Acts.

As soon as the matter was announced in the press, we realised at once that the answer to the request was obvious, and were not surprised when the Ministry of Ways and Communications stated that it did not think that the carrying of a passenger on the carrier of a motor bicycle was a matter upon which legislation could be proposed at the present time.

To render this method of taking a passenger illegal would be distinctly interfering with the liberty of the subject. A motor cycle is a private vehicle, and there is no law to compel a passenger to ride on the saddle only. He or she is equally well entitled to ride on the tank, top tube, or handle-bar. Carrier riding on a solo machine is not a particularly safe method of progression, since, with a passenger on the carrier, the steering of the machine is slightly affected, and additional care should be taken by the driver, as a collision or sideslip may result in serious injury. On good roads, when reasonable care is exercised, the danger may be considered negligible, though the presence of a passenger may make a difference in a sudden emergency.

The Supply of Spare Parts.

SINCE our remarks upon the subject of spare parts three months ago we have had so many letters referring to this question that we feel compelled to return, albeit somewhat reluctantly, to the great importance of this branch of the motor cycle manufacturers' business. It is important, not to the rider only, but also to the manufacturer, that no machine should be laid up weeks (or months) for the want of some small item. A motor cycle running well on the road is a fine advertisement for its maker. A machine confined to its shed for want, say, of a valve rocker or some other trivial part, is very much the reverse. Moreover, the discontented owner is apt to make his voice heard in no uncertain manner amongst his friends and clubmates.

Many of the letters received are in praise of one firm or another for the prompt attention which they have given to small matters, but in the main we regret to say the letters are far from complimentary. This is not as it might be, for even with depleted staffs it should not be beyond the bounds of possibility to send a reply to a pre-paid telegram.

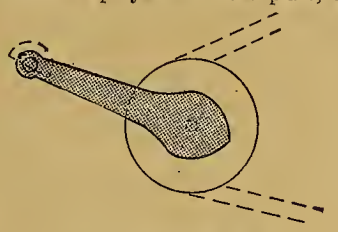
Competition will presently be keen in the motor cycle world, and then the firms who have earned a good reputation for the way in which they treat their customers, and for the excellence of their spare parts organisation, will reap a just reward.

An index to the advertisements in this issue will be found on the page facing the back cover.

IDEAS: Useful and Ingenious.

To Prevent Oil Spraying.

I AM the owner of a 1912 Triumph, and for some time was much troubled by oil spraying from the crank case release in the centre of the pulley. When one usually wears brown shoes this is most annoying. However, I cured the trouble in the following manner: From an old aluminium number plate I cut a piece of metal and shaped it as sketch, drilling a hole in one end A to allow it to be screwed on to the footrest. The metal shield was of such a length that the end B came exactly in front of the centre of the pulley. The oil now sprays on to the plate, and

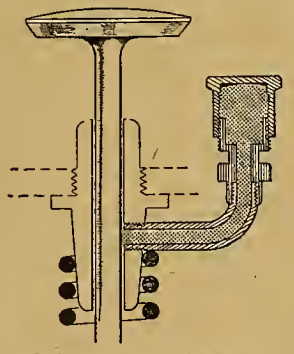


A shield for preventing oil spray from the crank case.

finally drops on to the road. The fitment, being of aluminium, looks quite smart, and has been much admired by many of my motor cycling friends.—JOHN A. HALL, Selly Oak.

Valve Stem Lubricator.

A SIMPLE method of lubricating the inlet valve stem to prevent squeaking and undue wear is by fitting an ordinary screw-down lubricator as follows. Procure the brass grease cup and a short length of iron tube. Bend the latter to a right angle, and screw

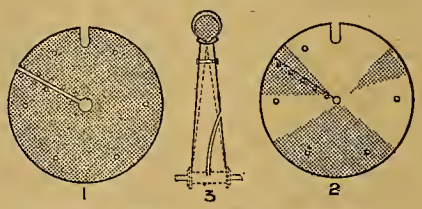


Lubricating the valve stem.

both ends. Drill and tap a hole in the valve guide to take one end of the tube, and screw the lubricator on the free end. The lubricant used is a dense mixture of oil and powdered graphite.—E. W. FLINT, Birmingham.

Wheel Discs at Low Cost.

THE sketch shown illustrates how I made very effective discs for my 3½ h.p. Premier motor cycle at an extremely low cost. Some sheet zinc was obtained and a circle cut and holes

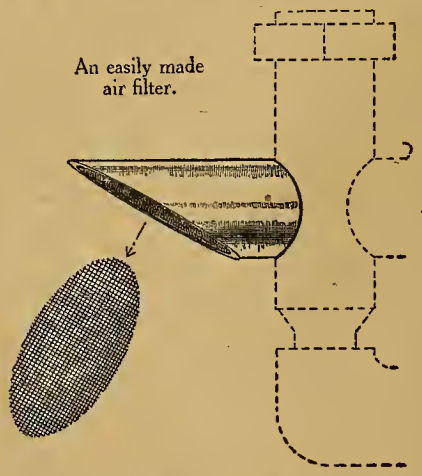


Illustrating method of making wheel discs.

drilled, as shown in the diagram. The piping in fig. 3 is brought to a hole in the disc to simplify oiling. On the belt rim side a small disc was made between the belt rim and the hub.—METRO.

Carburetter Air Filter.

AN easier method of fitting a gauze strainer to the carburetter air intake than making a cone is suggested by Mr. Buckley, of Stoke-on-Trent. His method is to saw off a piece of light gauge tubing, which will fit tightly over

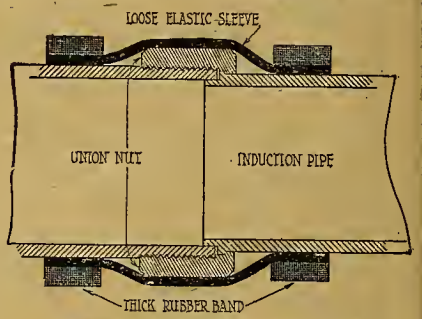


An easily made air filter.

the air tube, at an angle, and so obtain a larger area over which to solder the gauze. Moreover, this arrangement does not reduce the effective diameter of the pipe. This method has also the advantage of neatness, particularly if the attachment is plated.

Curing Air Leak in the Induction Pipe.

EVERY motor cyclist knows how annoying it is to have an air leak between the induction pipe and cylinder. Insulating tape does not last long, but a satisfactory substitute is an elastic sleeve, either end of which has a rubber band fixed to it. Thus one end fits tightly on to the induction pipe, and, having screwed up the union nut as tightly as necessary, pull the other end of the sleeve over by stretching it, and then

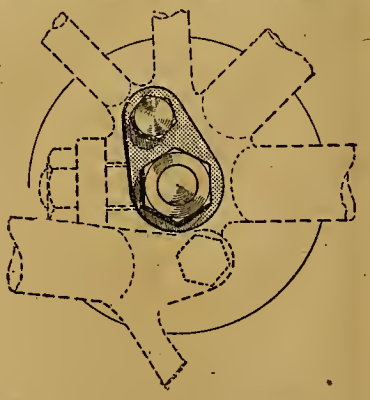


Preventing air leak in induction pipe.

put it so that it grips the cylinder part tightly. This would stop any air leak, and even vibration would not make any difference.—A. R. VICKERS, Mid. R.N.

Fixing the Wheel Spindle.

MR. R. F. MAYNE, of Harringay, makes the following suggestion for the benefit of those users of three-speed hubs who are troubled with the axle nuts working loose. The sketch makes clear the arrangement, which consists of a plate cut from sheet steel or brass to fit over the hexagon head of the axle nut. This is kept in position by the bolt which holds the carrier stays, and is usually adjacent to the wheel spindle.



Anchor plate for three-speed hub spindle.

Balls and Rollers for Me.

THIS paragraph is intended to demonstrate the unsuitability of phosphor bronze bearings for sale to the general public. The other day I set off on a trip of exactly fourteen miles out and home: twenty-eight miles in all. My brain being occupied with affairs of state, I neglected to verify the contents of my tanks. After seven or eight miles it occurred to me to glance at the sight-feed oiler. As every reader knows, this process entails (*a*) dismounting; (*b*) carefully dismantling a complex fitting constructed mostly of soft brass, with due care not to tear the stub unions in half; (*c*) wiping out the congealed filth from a glass tube with one's only pocket handkerchief; (*d*) praying for a miracle, *i.e.*, the reassembly of a brittle glass tube between two metal holders in such wise that there shall be an unbroken glass equipped with two large oil-tight joints; and (*e*) getting a peep at the rate of drip before the glass fouls itself once more. For once I performed the quintuple operation with success. There was no drip! I investigated the oil tank: contents nil! I opened the crank case drain: there was no oil, except for a faint greenery-yallery smear on the entrails of the engine!

I cheered my timid soul with the reflection that I could purchase oil at the fourteenth milestone. Arrived thereat, I found the garage closed and all the staff off joy-riding to a cattle show or some such local bean-feast. Problem: Should I engage a bed, and wait till the morrow, or chance twenty-eight miles with a dry crank case? Considering that there was not a single plain bush in my engine, I completed the trip without oil, and, so far from doing any harm, the engine positively enjoyed it.

Solos, Sidecars, and Gear Boxes.

IT would be very interesting to know how far the sidecar is responsible for the universal adoption of change-speed gears. From the point at issue between "Veteran" and "Sunbinks," it is fairly clear that the sidecar must answer for the low bottom ratios fitted to machines of 500 c.c. and over. There is no English hill—excluding the haunts of the precipice-questers—which a good rider on a good 3½ h.p. cannot make sure of with a bottom gear of 7½ to 1, but the emergency gears of standard 500 c.c. machines usually run into double figures; I myself have a four-speeder with a *second* gear of 9½ to 1. No doubt these freak ratios are partly a concession to the duffer type of solo rider, and may partly be inspired by the motive of affording an easy start from rest on the clutch. Nevertheless, one might argue that if the sidecar had never been invented, or had early been swamped by sound cycle cars, the average motor bicycle would have had a bottom gear of at most 8 or 9 to 1. Incidentally, it would certainly have weighed a great deal less. Until sidecars came into general use, 200 lb. was regarded as rather absurdly heavy; and I do not think the trade would have produced, or the public have accepted, machines scaling 3½ cwt. or more but for the needs of passenger traffic. If there is any sense in this argument, the sidecar has been a very powerful factor in the evolution of the motor bicycle; it first evoked emergency gears of almost infinite reduction; it led to serious weight increases; and, finally, double-figure gears converted undue weight into a question of secondary importance.

The Importance of Being Earnest.

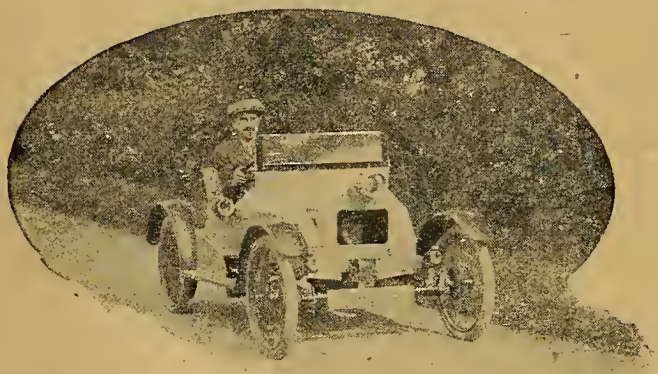
THE term "earnest" as applied to a motor cyclist includes nightly attention to every bolt and nut on the machine, according to Cocker (*i.e.*, "Motor Cycles and How to Manage Them"). I was never "earnest" in this sense, being born with an irresponsible instinct for chancing tiresome details. So it fell on a day that the industry was almost relieved of the impertinences of this giddy scribe. What with being demobbed, and the sun shining, and having just got over being jilted by Araminta in favour of a bloated munitioner, I was driving a trifle bluer than my wont: in fact, I was indulging in what might be termed a spiritual T.T. and seeing how little time I could waste round corners. The particular corner which nearly created a vacancy for a man of push and go on the staff of this journal approximated in plan to the elevation of a church steeple, and was fortified by an extremely forbidding stone wall. I roared up to it at full revs., and at the fifty-ninth minute of the eleventh hour I shut my throttle lever and stood on my brake. The engine maintained full revs., and ate up the brake as if it had been tissue paper. With great presence of mind I lifted the exhaust valve lifter. The engine maintained full revs. very cheerily. By this time my front mudguard extension was within a few millimetres of the above-mentioned stone wall, and the pace was terrific. Another brain wave—I stood heavily on the clutch pedal, having no switch, and applied the front brake with vim and vigour. The machine did a sort of shimmy-shake skid, and twisted itself round the corner fearsomely. I stopped the engine by turning off the petrol. Item: the throttle wire was looping the loop outside its casing, instead of going home to bed. Item: the exhaust valve lifter had shed two weeny screws into the road. Item: the clutch control depended on two microscopic nuts apparently intended to secure a sewing machine needle to its holder, and the sole survivor of the pair was hanging on the last whorl of its thread. I must have been born to be hanged.

Draw the inevitable moral, gentle reader. Motor cyclists should be "earnest" at all times, and inspect all nuts and control connections daily. It is even more important to be earnest when you receive your discharge and return home to bestride a neglected 'bus in somewhat light-hearted fashion. A tuft of grey now distinguishes my raven forelock.

THE Sidecar Alternative.

A Commentary on Tendencies in Runabout Design.

WITHOUT doubt there exists a certain demand for a sidecar alternative, and many manufacturers appreciate this. It may be said that for some time they have realised there is room in the world of motoring for a vehicle as efficient as the sidecar, but providing equal protection from the elements for driver and passenger. There are quite a large number of experimental machines on the road—every



A privately constructed runabout with a 3½ h.p. Triumph engine—a machine which approximates in cost, weight, and performance to a 3½ h.p. sidecar. Mr. H. T. Lloyd, who built the machine, is at the wheel.

week news comes of a new design by a motor cycle firm or by a newcomer to the ranks of makers graduating from the aircraft sundries industry. *The Motor Cycle* has illustrated and described many of them, and in the Editor's private diary there are references to many more; but in summarising impressions of the situation, a strong doubt exists as to whether the real sidecar alternative is yet in sight as a marketable proposition likely to menace the present popularity of the sidecar.

Often has the writer heard the opinion expressed that the sidecar, sooner or later, will have to give way to the reborn cycle car; as an enthusiast where both types are concerned—a keen builder of cycle cars and a buyer of sidecars—I see no signs that this will ever happen.

With very few exceptions the machines which are promised are not sidecar alternatives, but go one stage further and help to bridge the gap between sidecar and light car, and are just as much alternatives to the car as to the sidecar. In short, they form an intermediate class catering for an almost new class of buyer.

Not until a runabout is produced as good, as efficient, as compact, and at the same price as the sidecar will it menace the latter's popularity, and this, in the opinion of many designers, is impossible.

As there are at least three types of sidecars, according to their power, there must be three types of runabouts —(1) the first approximating in weight, power, and cost to the popular 3½-4 h.p. single-cylinder machine of to-day; (2) a machine lining up with the 5-6 h.p. twin; and another (3) with big twin engines with the same reserve of power as the 8 h.p. British and American machines.

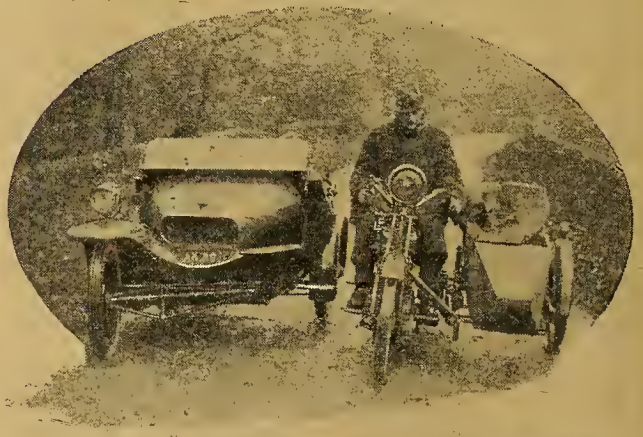
If the weight of a three or four-wheeler cannot be brought down to that of the sidecar, then the latter, power for power, will always score on petrol consumption, hill-climbing ability, and flexibility.

If a 5-6 h.p. cycle car can only give the same overall efficiency as a 3½ h.p. sidecar, and cost as much to run as an 8 h.p. sidecar, then the sidecar will retain its place as the leader in economical motoring.

No Revolutionary Designs.

But is it not possible to obtain *all* the advantages of the sidecar plus the advantages of the runabout? Is it reasonable to expect these results? The answer is in the affirmative in both cases, for this is an age of progress, and nothing has yet been done which cannot be improved. It *is* possible, but, for some time to come, very improbable. So far, no revolutionary designs are in sight as the production article. Most of the new designs which will be offered as sidecar alternatives are not of this class. Rather are they vehicles forming a step from the sidecar towards the car proper, and as such will find a large market awaiting them. The present price for a first-class sidecar outfit is about £150. The prices of the runabouts average about £200. It is a doubtful point whether some of them are not light cars. If they are, then they represent the bottom of one class while the luxurious sidecar is at the top of another.

Everything else being equal, the runabout of the immediate future will cost more than the sidecar, and for that reason can be regarded as a sidecar alternative only by those who can afford the extra price.

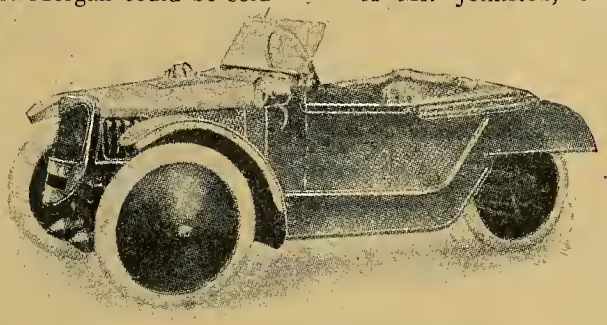


The Scott Sociable alongside a sidecar, showing how they compare in size.

The Sidecar Alternative.—

A study of three-wheeler designs, which are mostly attempts to improve upon the Morgan, will show that there appears to be a tendency to over-develop the type. Mr. H. F. S. Morgan, in designing his well-tried runabout, knew that, to produce his machine at a price approximating to that of the sidecar, simplicity must be the keynote of design. If the reader will compare the Morgan chassis with the motor cycle and sidecar (without body), he will find that the former is very much more simple than the latter. In fact, it is practically certain that, produced under identical conditions on a quantity basis, the Morgan could be sold at a lower figure than a sidecar outfit of the same power.

Not so, however, with the "improved" three-wheelers now being introduced to the public. Three speeds and reverse gear box, pressed steel chassis, and such items of specification considerably increase the cost, and, while they may be more refined mechanically than either the Morgan or the sidecar, to all intents and purposes they are three-wheeled light cars, and it is a questionable point whether the motor cyclist looking for a sidecar alternative requires a three-wheeled light car.

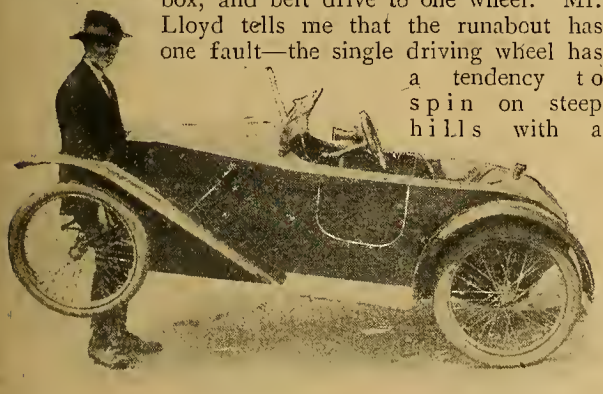


The latest Morgan Runabout, the machine which has kept alive the interest in sidecar alternatives.

An Alternative to the 3½ h.p. Sidecar.

Perhaps the nearest approach in cycle cars to the 3½ h.p. sidecar is the Lloyd runabout illustrated. This was built by a Triumph 3½ h.p. enthusiast several years ago, and is still in service. I have watched the performance of this little four-wheeler over a considerable period, and without doubt its general performance is equal to that of the 3½ h.p. outfit. At a recent trial in the Midlands I was able to compare its running with a 3½ h.p. sidecar of the same power. On Edge Hill the driver changed down to second at the same spot as a 3½ h.p. sidecar of well-known make, and to bottom even later.

The machine has a wooden chassis, a 3½ h.p. Triumph engine, Sturmey-Archer three-speed gear box, and belt drive to one wheel. Mr. Lloyd tells me that the runabout has one fault—the single driving wheel has a tendency to spin on steep hills with a greasy surface. This is due to insufficient weight over the back axle. Otherwise, Mr. Lloyd's machine can be said to be the true alternative to the 3½ h.p. sidecar.



The new Bleriot Whippet, a light four-wheeler embodying moto. cycle practice.

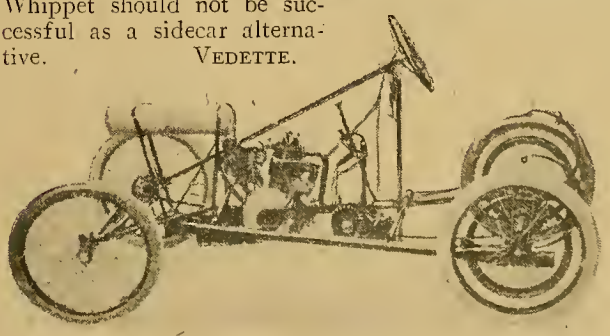
Others have endeavoured to make sidecar alternatives, of which the Scott Sociable is probably the best known. Although so far it has not been offered to the public, the time is not far distant when it will be put on the market in an improved form. In this construction we have an entirely redesigned sidecar machine with two-stroke twin engine, shaft drive, and a triangulated form of framework.

A Mr. Johnston, of Torquay, was another who made a well-thought-out attempt to provide a sidecar alternative. This designer used a triangular frame and placed the engine further aft than is usual, thus obviating the long primary drive chain which is never a desirable feature on a cycle car. This brings the engine nearer the centre of the machine, and altogether the layout is similar to the sidecar in this direction.

In an article on this topic, it would not be fair to omit reference to the G.N.—the only survivor of the earlier four-wheelers. In this light vehicle, with its shaft-cum-chain transmission, there is very little motor cycle practice embodied. The engine is an 8-10 h.p. 90° air-cooled twin, but beyond that the designers appear to have deliberately avoided both sidecar and car practice, and followed their own line of thought, and it therefore becomes one of the several attractive machines representing a stepping stone between the two.

There is one other little four-wheeler of which more may be heard, since its production is in the hands of a company capable of making a good showing in the industry. I refer to the Blériot-Whippet, which follows cycle car practice with its expanding pulley gear. This feature, however, differs from the acknowledged failures of the past in so far that the pulleys are of ample size and are used in conjunction with a clutch. In the old cycle car the belts and expanding pulleys were called upon to function as a clutch and change speed gear, and in the days when belts were not so good as they are to-day, it was asking too much. There appears no reason why the little Blériot Whippet should not be successful as a sidecar alternative.

VEDETTE.

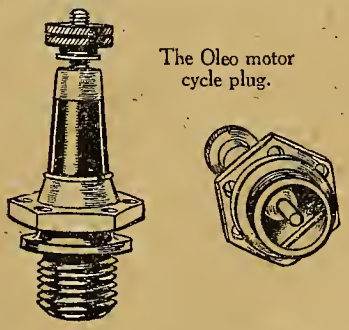


The Johnston runabout chassis. Note the position of the engine.

THE LATEST OLEO PLUGS.

OLEO plugs are now manufactured in England, a fact which should be noted as these plugs have been long associated with our French allies, having first of all been produced exclusively in their country.

The latest pattern Oleo plug is exceedingly light in construction, as can be seen



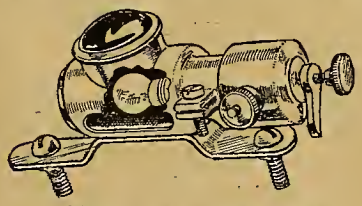
The Oleo motor cycle plug.

from the illustration, while the electrodes are substantial, and the plug should be reliable and free from sooting troubles.

We were to have used a pair of these plugs in the London-Edinburgh run but were unable to do so as, owing to the position of the hexagon, they could not be got into the cylinder. There is no doubt, however, that they will fit practically any standard motor cycle.

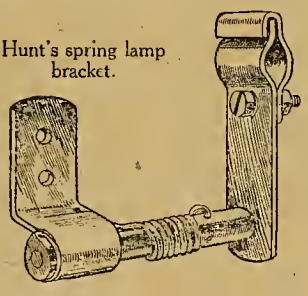
USEFUL ACCESSORIES.

WE lately inspected a useful little tail lamp on the occasion of a visit to the showrooms of Mr. A. H. Hunt, 115, Cannon Street, London, E.C.4. The tail lamp is well made, and is attached in the centre and at the top



A tail lamp and switch marketed by Hunts, of Cannon Street, E.C.

of the number plate. A slot is cut in the base of the body of the lamp which allows the light to shine on the number, while a good size red bull's-eye shows the correct red light to the rear. The lamp is of the two-terminal variety, and is provided with a switch and a locking device.

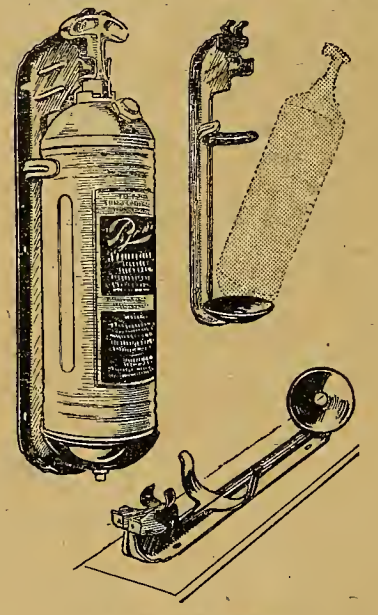


Hunt's spring lamp bracket.

We also saw an extremely neat and useful spring lamp bracket for the rear lamp, which should do much to prevent breaking of the bulb in an electric, or the jarring out of an acetylene lamp. One of the most interesting features of the bracket is the method of securing it. The detachable portion is bent to fit over the fixed portion, which renders the fixing quite secure and necessitates the use of one bolt only.

A FIRE EXTINGUISHER.

NO motor cyclist should be without a fire extinguisher of some sort in his motor cycle shed. Whenever petrol is present, there is always danger of fire, and, owing to the inflammable nature of petrol, it is quite easy for the shed and motor bicycle to be consumed in a very short space of time. It is not only neces-



The Pyrene fire extinguisher.

sary to insure the machine; insurance sounds very well, as the insured naturally thinks that his policy will entitle him to a new machine if his own is completely destroyed by fire, but, while the Insurance Company will pay the cost of damage, it will not undertake to procure a new motor bicycle, as machines are practically unobtainable at the present time. A good fire extinguisher is a necessity.

The solo machine cannot very well be protected by a fire extinguisher, owing to the limited space for one, but on a sidecar machine there is ample room for this, and it is not difficult to attach it by means of a special bracket, such as is provided with the Pyrene which we are about to describe, on to a convenient frame tube.

The Pyrene extinguisher is an ingenious form of pump, which consists of a couple of valves free to swing about the central tube, and so designed that one of the valves is always immersed in liquid, whether the device is held horizontally, downwards, or upwards. After the first two strokes, the liquid is ejected from the extinguisher at every stroke. Now, in the case of a small fire, one squirt of liquid is usually sufficient. On the liquid being subjected to a temperature of 200° Fahr. and over, it is instantly transformed into a heavy, non-poisonous gas, which, by excluding the air, puts out the fire. We may add that the liquid is non-poisonous and non-corrosive.

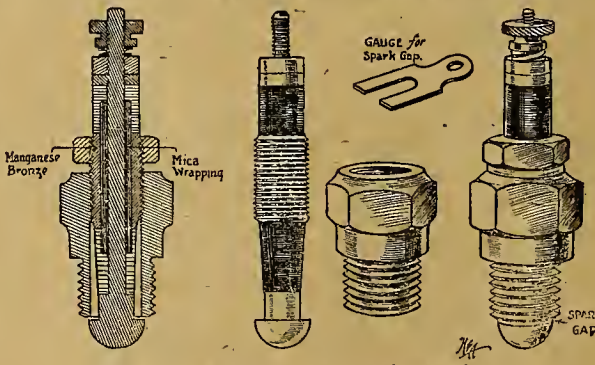
These devices are made by the Pyrene Co., Ltd., 19-21, Great Queen Street, London, W.C.2.

NOVEL SPARKING PLUG.

A SPARKING plug in which several novel features are introduced is the B.P., manufactured by Messrs. Barraclough, Parker, Ltd., Thornton, Bradford. The plug is of the mica variety and, externally, it does not show much departure from standard practice, except that it possesses a hemispherical solid nickel electrode. The centre portion is insulated by several wrappings of mica, over which is pressed a brass tube on which threads are afterwards chased. Washers of mica are then slipped over the whole and are compressed as tightly as possible.

A gauge is supplied which can be inserted between the central electrode and the plug body, so that before the gland nut is secured the correct spark gap can be obtained. These gauges are made in various sizes, so that any gap from a millimetre downwards may be made.

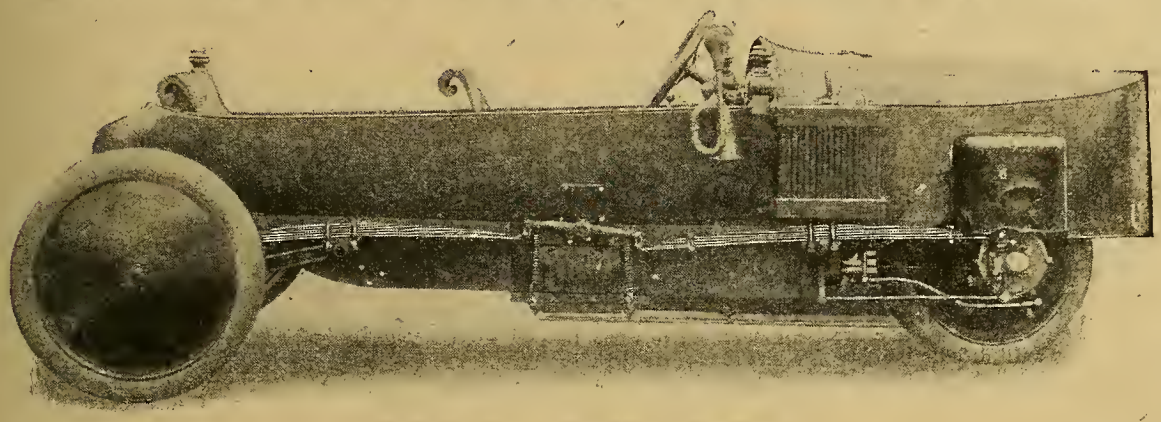
The B.P. plug is well finished and designed, and the following claims are made for it. The central electrode being a solid nickel steel forging gives an intensified spark, and provides an ample volume of metal to prevent incandescence, rendering the plug especially suitable for two-stroke engines. As the dome head is of larger diameter than the body of the plug it thus prevents the hot gases and oil from gaining access to the insulation. The plug can be detached and reassembled in two minutes, with the certainty that the spark gap is correct. After the plug has been fully tested it is guaranteed for twelve months.



The B.P. plug in section, parts, and external view.

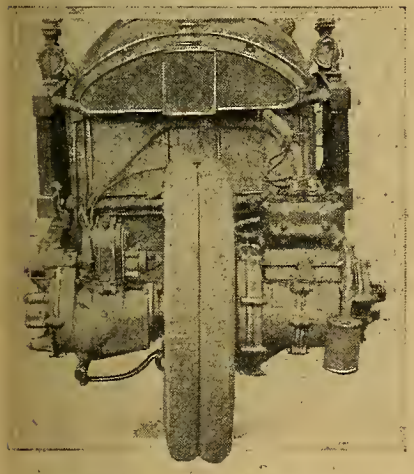
A FRONT WHEEL DRIVEN RUNABOUT.

The Trident Cycle Car, a French Design to be Produced in this Country.



The tandem-seated Trident front-driven runabout.

A THREE-WHEELED, two-seater runabout of unusual design has recently arrived in this country from Paris, which, in the course of six months or so, will be placed on the English market by the Federated Exporters, Ltd., 11, Haymarket, London, S.W.1.



The Trident cycle car, showing the twin-tyred front driving-wheel and the arrangement of the engine, gear box and magneto.

The design and construction of this little car are quite unique so far as three-wheelers are concerned. The complete power unit, transmission gear, steering apparatus and road wheel drive are in one unit, and contained beneath the tapered bonnet in front of the driver's seat. A *monobloc* two-cylinder engine, with cylinders 65 × 110 mm., is located on the near side of a twin-tyred wheel, the flywheel being enclosed. The power is transmitted from the crankshaft through a sleeve in the driving wheel to the gear box, returning again to the road wheel through bevel pinions. The position of the magneto is somewhat unconventional, for it is bolted to, and driven from, the gear box.

Many interesting features are incorporated in the construction of the Trident car, notably the "Cantilever" suspension. This consists of four semi-elliptic laminated springs, two on each side of the chassis. The front springs, which are bolted to a shackle pin on the gear box and crank case casting respectively, are attached, through a double shackle at their rear ends, to a pivoted arm which rotates upon a shaft bolted to the longitudinal chassis member. The rear springs are arranged in a similar manner.

A shock-absorbing device is provided by means of two spiral springs attached at their upper ends to each extremity of the pivoted arm, and the lower ends to bolts protruding from beneath the longitudinal member of the chassis. The centre of each leaf spring is attached to the frame by means of two "U" bolts, providing in all a six-point suspension, which, it is claimed, distributes the weight of the car evenly over all four springs.

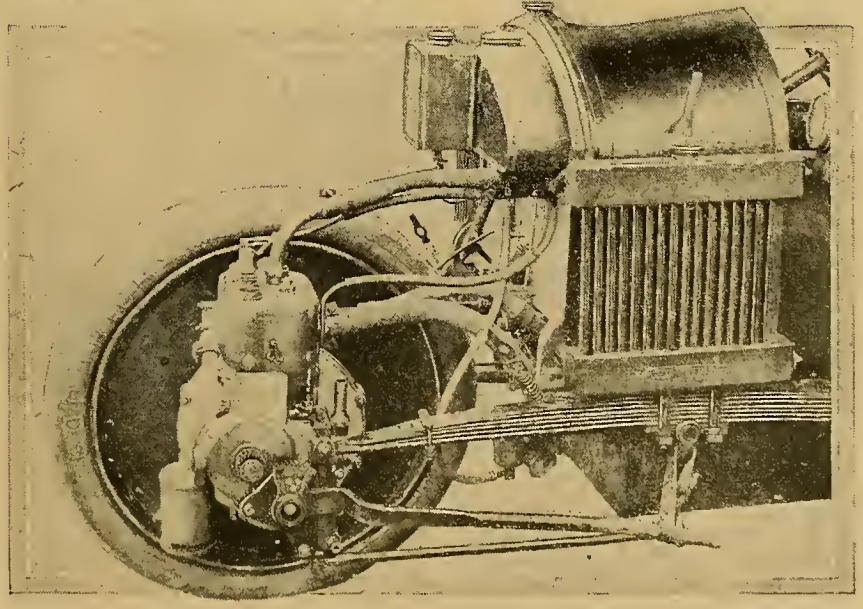
The driving wheel is provided with a form of universal joint, which allows the steering arm of the irreversible gear, attached to the hub of the wheel, to move it horizontally about its centre axis.

Should the tyres of the single driving wheel require to be removed, the complete engine unit, being pivoted on a bearing on the near side chassis member, can be swung round, and drawn away from the wheel, allowing the tyres to be easily removed. A starting device, somewhat similar to a motor cycle kick-starter, is employed.

The radiator on this cycle car is divided into two sections, and carried on either side of the dashboard. This design, however, may be improved.

Both front and rear brakes are provided, the former consisting of an external contracting band operating on the hub of the front driving wheel; the latter, however, adheres to the strictly conventional practice, being an internal expanding brake, as fitted to many standard motor cars.

This cycle car will be manufactured by Messrs. Vickers, Ltd., and will be placed on the market at £160.



Showing the curious situation of the vertical twin engine.

NO AGE LIMIT.

A Fourth Selection of Letters from Riders of Mature Years.

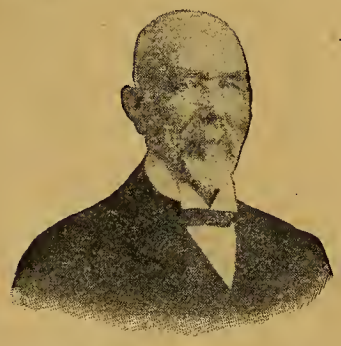
THERE is now ample evidence to show that no age limit exists where motor cyclists are concerned and that modern machines fulfil the requirements of all who desire to use them. In previous issues we have published letters from a dozen old-young readers, varying in age from sixty-three to seventy-seven, and the oldest motor cyclist, to our knowledge, is Mr. Robins, of Barnstaple, who is eighty-one years of age. Mr. W. Bray, of the Apex Cycle Works, Barnstaple, advises us that Mr. Robins rides an old 3½ h.p. single-geared Rex, which he manages without trouble. We have heard of other riders of mature years who are in the eighties, but until definite information concerning them reaches us, Mr. Robins stands as the oldest practical motor cyclist.

Perhaps other old-young readers who are riders will allow us to place their experiences on record, and we repeat our invitation to all riders who are approaching, or have passed, the sixty-year mark.

A 79-year-old Correspondent.

Writing from Stretham, Ely, Cambs., the Rev. J. Parnell says:

"I think I can compete with the old-young motor cyclist, as I was born in 1840, and if I live till the 18th of August I shall enter my eightieth year.



Rev. J. Parnell (age 79).

"I did not ride a bicycle till I was over seventy, and in 1912 I bought a motor cycle and sidecar to take out my invalid wife, and have used it more or less each year since, the best ride being during last June."

Mr. John Watson, of Burnley, is sixty-one years of age, and is a motor cyclist with a long experience.

"I have been a motorist many years," he writes, "my first mount being an old chain-driven Humber, accumulator ignition, with which I had some stirring times, including a trip to Lakeland, with my youngest son on the carrier. This machine cost me the fabulous sum of £6 10s. My next mount was a 3 h.p. Rex, to which I attached a sidecar. I think I owe my vigour and health to this combination, for I used to slip off the saddle and run alongside on hills until I became quite a sprinter. My next mount was a good old Lincoln Elk and sidecar, with which I have toured Wales several times."

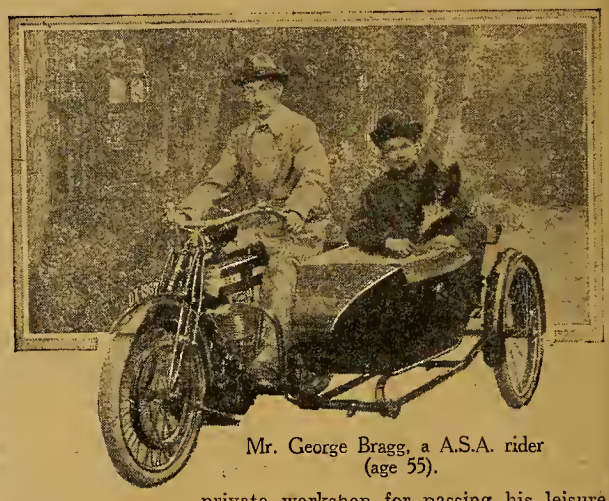
Mr. George J. Bragg, of Ipswich, is only fifty-five, and, therefore, a comparatively young man. There are many riders between fifty and sixty, but there are also a large number of hesitating would-be motor cyclists about this age who consider that they are too old to commence. Mr. Bragg has just taken up the pastime, and his remarks may assist others to come to a decision. He writes:

"I am in my fifty-fifth year, and I am fully aware I am not the oldest motor cyclist on the road. It is quite surprising how soon one can get efficient in driving at my age; I had not ridden or even examined a motor cycle until I received my B.S.A. and sidecar just under a month ago, since when I have driven it over 400 miles.

"Like many others, we have suffered a terrible bereavement during the war, having lost our two sons—all our family consisted of.

"I felt that my wife and I needed a change to take us from our solitary home, and, in this short time, we find it a great pleasure and comfort to us."

America, too, has her old-young riders—the photograph we reproduce depicts two veterans whose combined ages total 147. They are Capt. H. C. Hollenbeck and J. E. Jones, of Sawtell, California. They were old comrades in the American Civil War, and now travel in company on comparatively long journeys. Mr. Jones has used a motor cycle for three years, and maintains a private workshop for passing his leisure time in motor cycle engineering.



Mr. George Bragg, a A.S.A. rider (age 55).

Young-old riders whose letters have already been published:

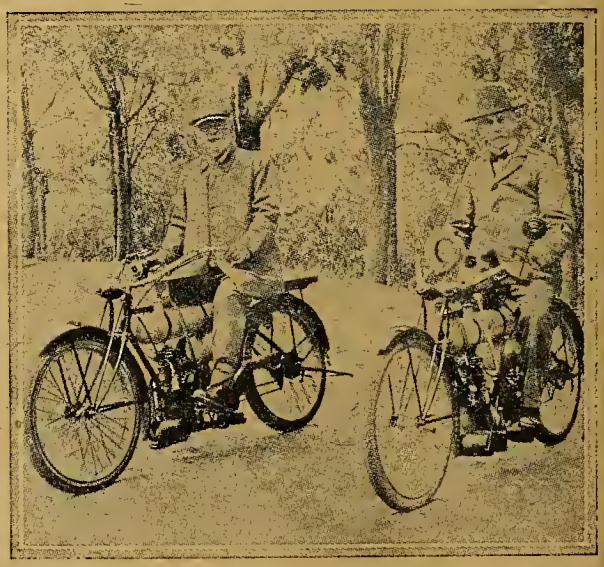
Building a Motor Cycle.

From time to time we have heard of quite a number of young-old men who, having retired from business between the age of fifty and sixty, have been at a "loose end" for lack of a hobby to occupy their time and mind. One reader, who retired from the Civil Service at the age of sixty, advises us that, with the aid of a small workshop, he has built a motor cycle from second-hand parts and derived great pleasure from the work. Having built the machine, he sold it at a profit.

Without any tuition other than a close study of "Motor Cycles and How to Manage Them" and the weekly numbers of *The Motor Cycle*, this "man of mature years" not only built this machine but learned to ride it.



Two American veterans who are owners of Cleveland two-strokes.

Motor Cycles.

Revised Prices.

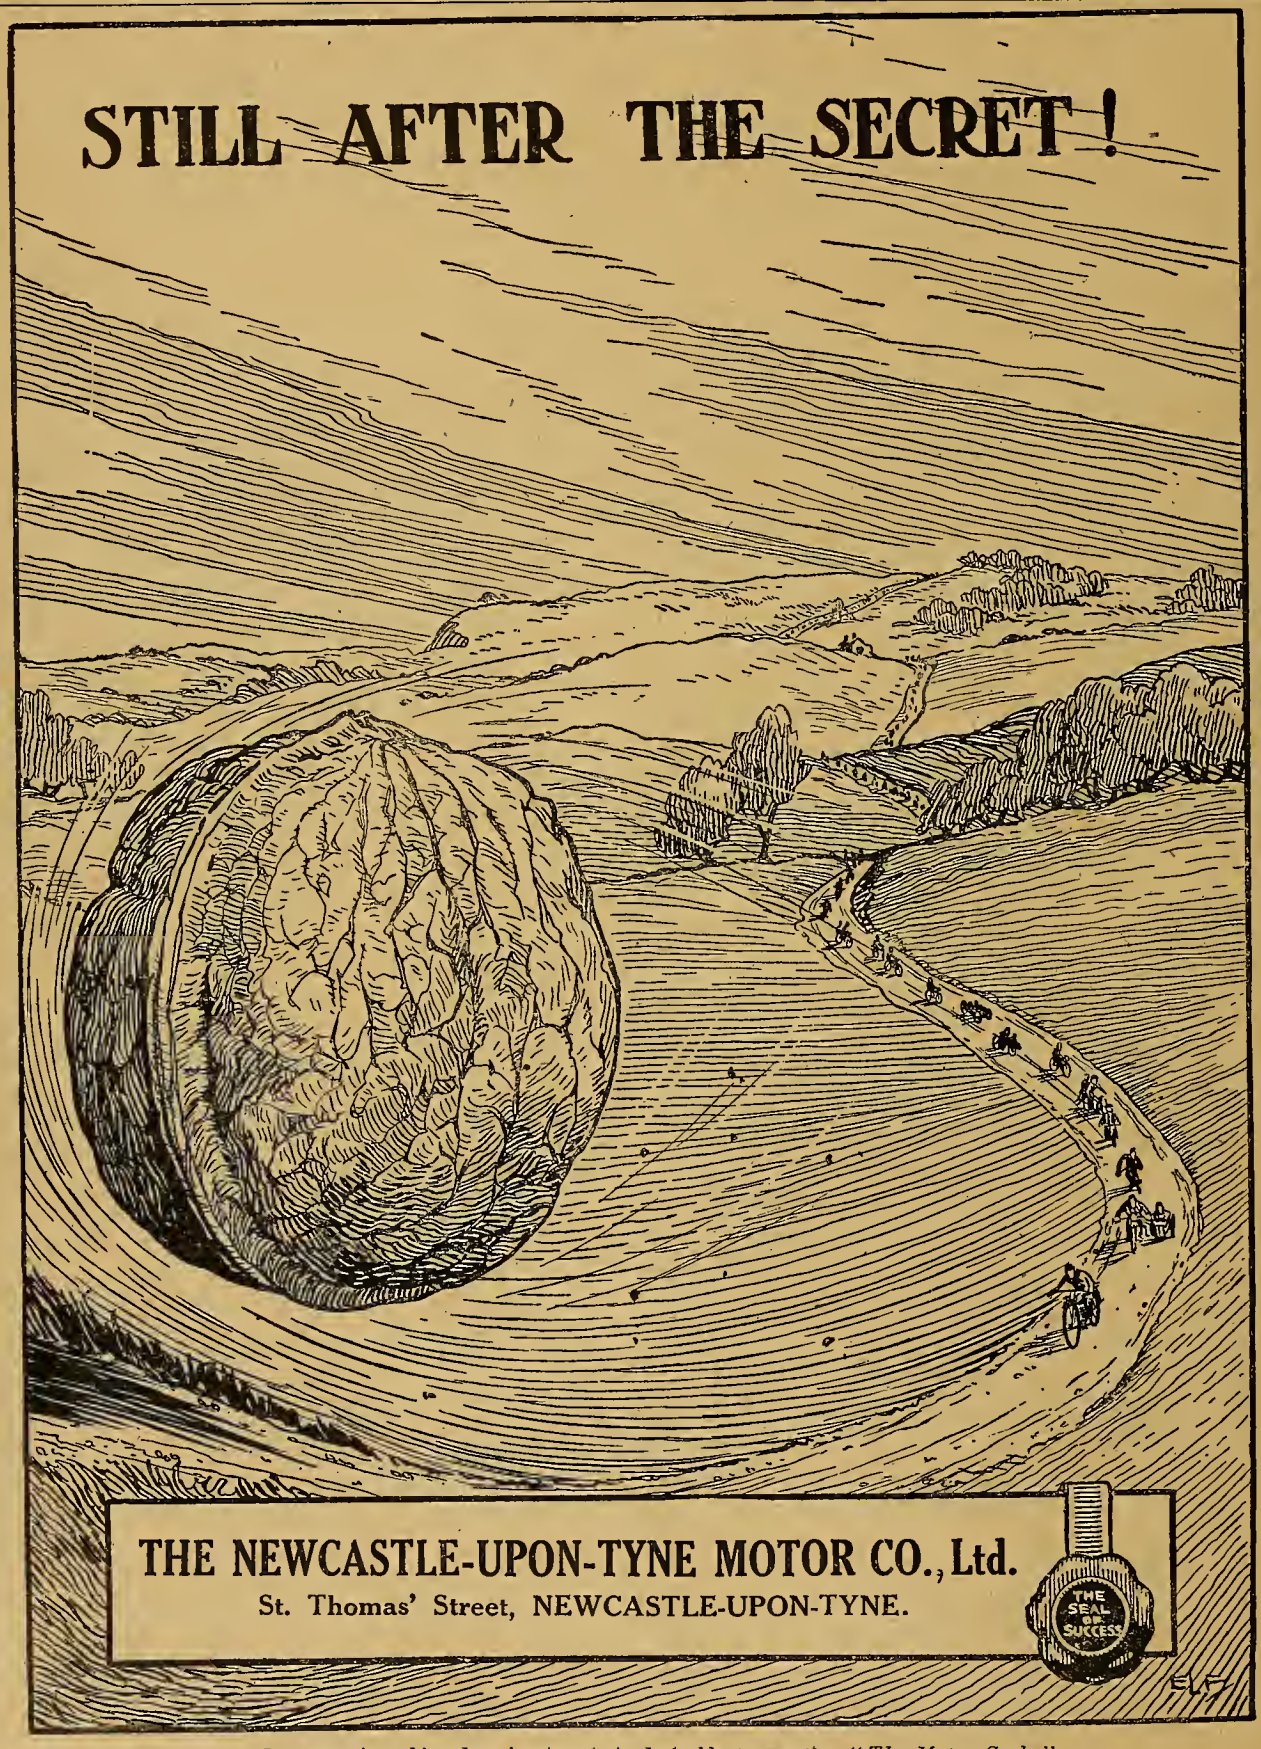
ARIEL WORKS LTD., 3, BOURNBROOK, BIRMINGHAM.

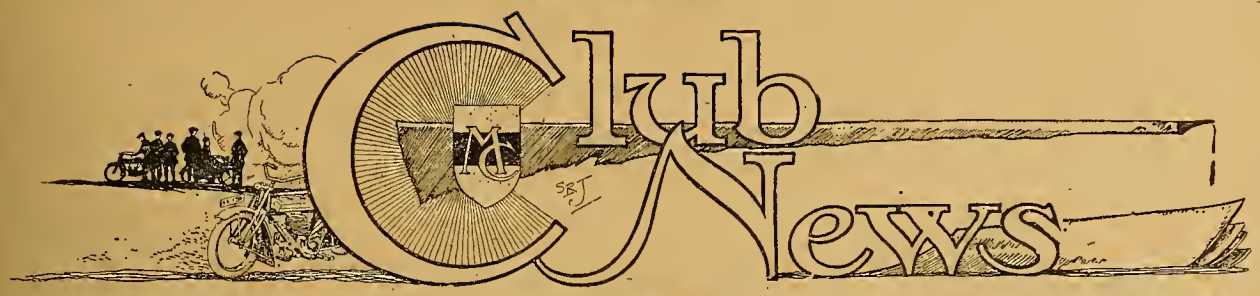
STILL AFTER THE SECRET!



THE NEWCASTLE-UPON-TYNE MOTOR CO., Ltd.

St. Thomas' Street, NEWCASTLE-UPON-TYNE.

In answering this advertisement it is desirable to mention "The Motor Cycle."



Birmingham M.C.C.

L. Baker (4¼ B.S.A. sc.) has to be included in the list of competitors bracketed as equal winners of the Lycett Trophy.

Ilkeston and District M.C.C.

Mr. W. D. Thornley, No. 1, Station Road, Ilkeston, has been elected secretary of the above club, with Mr. Trueman, Middleton Lodge, Ilkeston, assistant secretary.

Public Schools M.C.C.

The above club will hold a "touch nothing" competition on Saturday next, starting from Barnet at 2 p.m. The destination for the night will be at Newport Pagnell, the return being made on the following day.

Liverpool M.C.

Mr. S. W. Phillpott, president of the above club, recently organised a very successful afternoon series of impromptu competitions, which were held at Frodsham.

First event.—Petrol consumption trial. In this competition competitors were allowed to fill their carburetters, and then had to turn off the petrol tap from the tank. They were then started up a hill, and had to remain where they stopped, the competitor riding the greatest distance being the winner. Solo machines, six competitors: 1, N. C. Sclater (2¾ Douglas); 2, S. Parker (2¾ Conlson B.). Sidecars, ten competitors: 1, H. T. Williams (6 A.J.S.); 2, E. L. Boston (3½ Sunbeam).

Second event.—Slow hill-climb. The riders had to remain in one gear, and were not allowed to use the clutch. This event was run in heats, riders being side by side, moving start. Solo machines, six competitors: 1, T. Harben (3½ P. and M.); 2, S. Parker (2¾ Conlson B.). Sidecars on middle gear: 1, W. Brindle (3¼ Triumph); 2, R. H. W. Brown (6 A.J.S.).

The third event took the form of a competition uphill on a J.B. motor scooter, lent by Messrs. J. Blake and Co., the rider travelling the farthest to be the winner. Result: 1, E. H. Boston; 2, Noel H. Brown.

The results of the first club trial are now announced as under:

FIRST-CLASS AWARDS.

H. P. Sutcliffe (6 A.J.S.), H. G. Hague (Stellite car), J. E. Wilkins (3½ Sunbeam), R. H. W. Brown (6 A.J.S.), E. L. Boston (3½ Sunbeam), S. B. Reece (9.5 Stellite), G. Honeyman (4 A.J.S.), J. H. Bagnall, and G. S. Boston (11.9 Morris-Cowley).

RETIRED.

J. C. Ansonia (2¾ Metro-Tyler), H. Larkin (4¼ Triumph), Wm. Cottle (2¾ Calthorpe-Jap), R. Rose, T. J. Lane, L. Matthews, and E. Rose.

Future Events.

July 12.—Western M.C.C. Team Trial.
July 12.—Motor Cycling Club. Hill-climb.
July 12.—York and District M.C. Week-end Run to Lake District
July 12.—N.M.C.F.U., Portsmouth. Run to Lee-on-the-Solent.
July 13.—Wolverhampton M.C.C. Social Run to Stratford-on-Avon.
July 13.—Taunton and District M.C.C. Run to Lyme Regis.
July 13.—Woolwich, Plumstead, and District M.C. Competition for the Mayor of Taunton's Cup.
July 13.—N.M.C.F.U., Portsmouth. Run to witness sunrise on Hindhead; start at 3 a.m.
July 13.—Ilkeston and District M.C.C. Run to Edwinstowe.
July 13.—Rochester, Chatham, and District M.C. Run to Westerham.
July 14.—Troedyrhiw and District M.C. "Dis-arranging" Competition.
JULY 14-15.—M.C.U. OF IRELAND, ULSTER CENTRE. IRISH END-TO-END RELIABILITY RUN.
July 16.—York and District M.C. Reliability Trial.
July 17.—Taunton and District M.C.C. 200 Miles Reliability Trial.
July 19.—Middlesbrough and District M.C.C. Side-car Competition.
JULY 19.—SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C. OPEN HILL-CLIMB AT STILE COP, NEAR RUGELEY.
JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.
July 19.—Western M.C.C., Glasgow. Week-end Run to Lake District.
July 19.—Manchester M.C. Hill-climb.
July 19.—Edinburgh and District M.C. Race Meeting at Lanark.
July 19.—N.M.C.F.U., Portsmouth. Run to Hunsdon.
July 19-20.—Cumberland County M.C.C., Carlisle. Reliability Trial to Aberdeen and Back.
July 19-20.—N.M.C.F.U., Coventry. Week-end Run through Wye Valley.
July 19.—Middlesbrough and District M.C.C. Side-to Donington.
July 20.—Woolwich, Plumstead, and District M.C. Run to Brighton.
July 20.—Rochester, Chatham, and District M.C. Secretary's Surprise Run.
July 20.—N.M.C.F.U., Portsmouth. Run to Corhampton Downs.
JULY 21-26.—SCOTTISH SIX DAYS TRIAL.
July 21.—Ilkeston and District M.C.C. Reliability Trial.
July 21.—Rochester, Chatham, and District M.C. Run to Whitstable.
JULY 23.—ESSEX M.C. SPEED TRIALS AT SOUTHEND.
July 23.—N.M.C.F.U., Portsmouth. Run to Blindworth Downs.
July 24.—Taunton and District M.C.C. Treasure Hunt.
JULY 25-26.—LIVERPOOL M.C. TWENTY-FOUR HOUR OPEN TRIAL.
JULY 25.—SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C. LIGHTWEIGHT TRIAL FOR CALTHORPE CUP.
July 26.—Western M.C.C., Glasgow. Run to Lake of Monteith.
July 26.—N.M.C.F.U., Portsmouth. Run to Poole Park and New Forest.
July 26.—Public Schools M.C.C. Six Hours Night Reliability Run.
July 26-27.—Wolverhampton M.C.C. Reliability Trial to Aberystwyth for Stevens Cup.
July 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.
July 27.—Ilkeston and District M.C.C. Run to Malvern.
Aug. 3.—Cumberland County M.C.C. Social Run.
AUG. 4.—YORK AND DISTRICT M.C. OPEN RELIABILITY TRIAL TO EDINBURGH AND BACK.
AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Coventry and Warwickshire M.C.

An open hill-climb is being arranged by the above club to take place in August.

Nottingham M.C.

The winner of the Dennis Bayley challenge cup in the recent trial has been declared as S. S. Debenham (8 Campion), R. McPherson (Rudge Multi) being second.

Kidderminster M.C.C.

This club has now been revived, and there was a good muster of members for the recent opening run. Local motor cyclists wishing to join the club should communicate with the hon. sec., Mr. C. Brown, 12, Stourport Road, Kidderminster.

The Douglas Club (Nottingham).

The secretary of this club, Mr. Martin J. Wright, invites Douglas owners to join the Douglas club. He hopes to obtain a membership of forty or fifty. The subscription is only a nominal amount, the object being to form a sporting club for riders of Douglas machines.

A Motor Cycling Club for East Berks.

Motor cyclists residing in the districts round Reading, Maidenhead, and in East Berkshire who are interested in the formation of a motor cycling club in that part are asked to communicate with Capt. J. V. Hay, Coruisk, Cookham, Berks, who would like to hear from as many motor cyclists as possible.

York and District M.C.

The reliability trial through Whitby, Saltburn, etc., arranged for Wednesday, the 16th inst., is over a course covering some of the finest moorland, coastal, and dale scenery in Yorkshire.

Several prizes are being offered. Silver cups of different sizes are being given as first, second, and third prizes.

The trial will be open to motor cycles, sidecars, and cars, on equal terms.

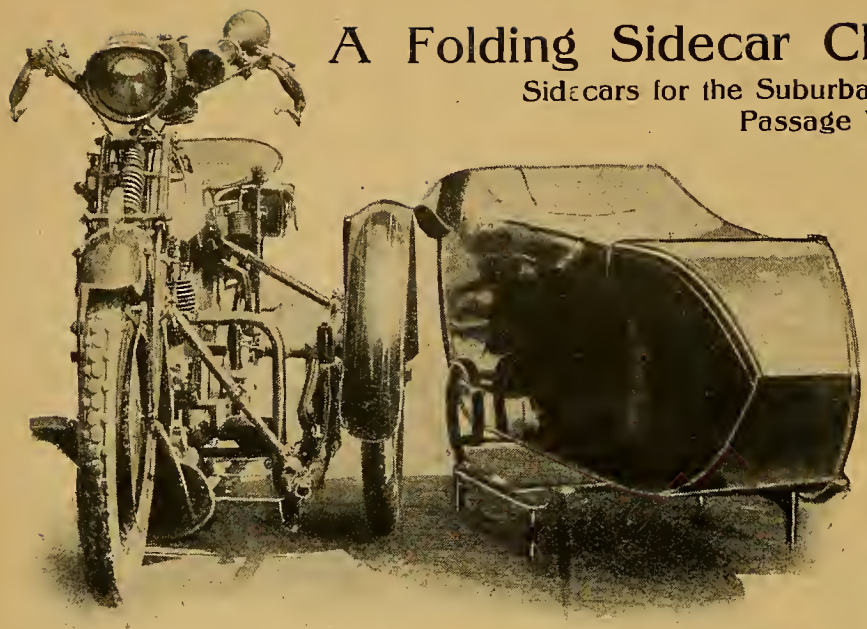
The entry fee, 3s., must be sent not later than Saturday, the 12th inst., to Mr. G. A. Reed, hon. sec., 6, Blake Street, York.

Motor Cycle Club of France.

The Paris-Rheims trial, organised by the Motor Cycle Club of France, was held on the 6th inst., over a distance of 182 miles. Twenty-eight competitors were entered, among them riders of Douglas, Rover, A.J.S., Harley-Davidson, and Excelsior motor cycles. Among the British competitors were Ball, Moffat, and Davis (junr.). The Rover riders were all of French nationality. F. G. Ball and P. W. Moffat rode the Douglas machines on which they competed in the London-Edinburgh run.

A Folding Sidecar Chassis.

Sidecars for the Suburbanite with Restricted Passage Way.



The Hop'ey sidecar, the body of which can be quickly detached from the chassis, the latter being of the folding type.

VERY little has been heard of folding sidecars since the revival of the pastime, and considering the acknowledged difficulty in obtaining garage accommodation, this is perhaps surprising. Usually, folding sidecars are not so pleasing to the eye as to make a strong appeal to the average motor cyclist, but the folding attachment illustrated certainly does not suffer on this score.

It is made by Frederick Hopley, of 38, Upper Highgate Street, Birmingham, and, as will be seen, the body is good design, and is made conveniently to lift off the folding chassis.

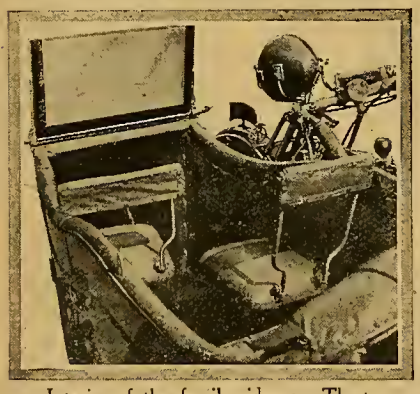
It is claimed that the body may be attached or removed in five seconds, and the chassis folds so that the machine and chassis are only 28in. wide. No nuts, bolts, or screws are used, the body being mounted on a rectangular frame having four vertical members which fit into sockets on the folding chassis, and by so doing lock it. The price, £25, is moderate, compared with the cost of sidecars to-day; or chassis only, less tyre, £12 12s.

The Family Sidecar.

A Handsome Multi-seated Attachment accommodating an Adult and Two Children.

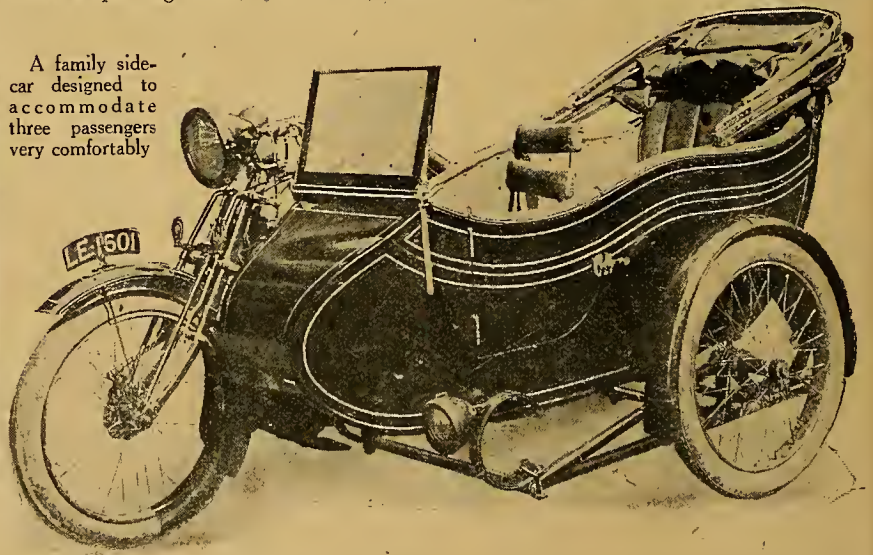
A FAMILY sidecar was recently demonstrated to us by Mr. W. J. Barker, A.M.I.A.E., which has been built by Messrs. Patey and Co., Ltd., Aeronautical and Motor Engineers, of 45, Horseferry Road, Westminster, London, S.W.1.

The body is specially designed for those who wish to take a passenger and two children in the sidecar. It has been built specially wide so as to allow plenty of room, and the seats will fold neatly away, and may be quickly placed in position. When both the small seats are occupied the passenger in the back seat has ample leg room, and Mr. Barker informs us that several very long journeys have been taken with the sidecar fully loaded. The motor bicycle to which the sidecar is fitted is an 8 h.p. Zenith with spring frame, which is quite satisfactory with the heavy load.



Interior of the family sidecar. The two small seats are easily removed, thus allowing plenty of luggage room inside the body when travelling with one passenger.

A family sidecar designed to accommodate three passengers very comfortably



READERS' ROAD REPORTS.

READERS in the Newcastle and Hexham districts inform us that the roads towards the Lake District and Carlisle are, with few exceptions, in very good condition. Newcastle to Heddon-on-the-Wall is bumpy and poor. From Heddon to Hexham is good; from Hexam to Alston fairly good, with some loose stones in parts; from Alston to Penrith good, with one or two short stretches of loose stones; from Penrith to Keswick, good; Keswick to Windermere and throughout the district, in first-class order; from Keswick to Carlisle and Dumfries, good most of the way; Annan to Longtown, fair; Longtown to Brampton, Haltwhistle, Bardon Mill, Haydon Bridge to Hexham, in first-class order.

A WEEK-END TRIAL TO WALES.

LAST week-end the Wolverhampton M.C.C. held a trial to Llandrillo, returning the following day. The start on each day was in the afternoon.

THE MOTOR CYCLING CLUB.

AS previously announced, the M.C.C. hill-climb is to be held on Saturday next, the 12th inst. Competitors should arrive at "The Buckingham Arms," Princes Risborough, at two o'clock. The timekeepers will be Messrs. F. T. Bidlake, A. V. Ebblewhite, and F. Straight. The best road from London is *via* Rickmansworth, Amersham, and Missenden.

THE LANARK RACES.

THE Edinburgh and District M.C. is organising a race meeting at Lanark Racecourse on the 19th inst. Five motor cycle races are included, as follow :

Five miles scratch race for machines up to 400 c.c.

Five miles scratch race for machines up to 600 c.c.

Five miles scratch race for machines up to 1,000 c.c.

Five miles scratch race for sidecars up to 1,000 c.c.

Five miles novice handicap for all classes of motor cycles, confined to Lanarkshire riders.

Three prizes will be given in each event. Full particulars and entry forms may be obtained from Mr. J. Watt Anderson, 6, Castle Terrace, Edinburgh.

AN IRISH TWENTY-FOUR HOUR TRIAL.

THE Dublin and District Motor Cycling Club held its 1919 twenty-four hour reliability trial on Friday and Saturday, the 27th and 28th ult. An entry of twenty-nine was obtained, and included the well-known cross-Channel riders, Hugh Gibson and A. G. Cocks, both of whom were mounted on 1919 model Clynos. The following twenty-seven competitors were despatched from Drumcondra Bridge at 8 p.m. :

W. H. Freeman (7-9 Indian sc.)
Maj. A. Waters (2¼ Triumph).
Dene Allen (3½ Norton).
G. Mayne (7-9 Indian).
T. Browne (2¾ Douglas).
H. Gibson (8 Clyno sc.)
S. J. Redmond (7-9 Indian sc.)
T. Woods (4¼ B.S.A.)
E. B. Russell (4 Triumph).
M. T. Doyle (7-9 Indian).
C. S. Kettle (4¼ B.S.A.)
J. P. Smith (7-9 Indian sc.)
A. G. Cocks (2½ Clyno).
W. J. Chambers (4¼ B.S.A. sc.)
J. P. Frost (2¾ Douglas).
J. A. Skehan (4¼ Campion).
C. W. Johnstone (7-9 Indian).
F. McDonagh (4¼ B.S.A.)
A. Carton (7-9 Indian sc.)
H. McAllester (4 Triumph sc.)
B. O'Brien (2¼ James).
T. Healy (4¼ B.S.A.)
T. Redmond (7-9 Indian).
— Grimes (3½ Norton).
J. White (4 Triumph).
T. Carton (2¾ Douglas).
W. J. Burney (6 Enfield sc.)

The course roughly included the northern half of Ireland, the route followed being *via* Dundalk, Belfast, Derry, Glengesh Hill, Donegal, and Cavan. During the Belfast-Derry portion of the run terrific weather was encountered, rain and gusts of wind alternating during the midnight hours. Many of the entrants went completely off the course, and arrived late (if at all) at the checks. McAllister (Triumph sc.) and T. Redmond (Indian) were among the unfortunates, while T. Carton had the bad luck to injure his controls.

Eighteen competitors arrived on time at Glengesh Hill—the crucial test of the trial—nine making clean ascents, Allen (Norton) and Chambers (B.S.A.) being particularly prominent.

Thirteen competitors checked in on time at Cavan, and the same thirteen signed in at Castleknock, Dublin. They were as follow :

Maj. A. Waters (2¼ Triumph).
Dene Allen (3½ Norton).
T. Browne (2¾ Douglas).
H. Gibson (8 Clyno sc.)
W. J. Chambers (4¼ B.S.A. sc.)
S. J. Redmond (7-9 Indian sc.)
T. Woods (4¼ B.S.A.)
E. B. Russell (4 Triumph).
M. T. Doyle (7-9 Indian).
A. G. Cocks (2½ Clyno).
J. P. Frost (2¾ Douglas).
T. Healy (4¼ B.S.A.)
W. J. Burney (6 Enfield sc.)

THE YORK M.C. OPEN TRIAL.

THE first annual open trial organised by the York and District M.C. will take place on August 4th, when a start will be made from York at midnight, and a return to York the following evening. Competitors will start in pairs at half-minute intervals. Particulars and entry forms may be obtained from the hon. sec., Mr. G. A. Reed, 6, Blake Street, York.

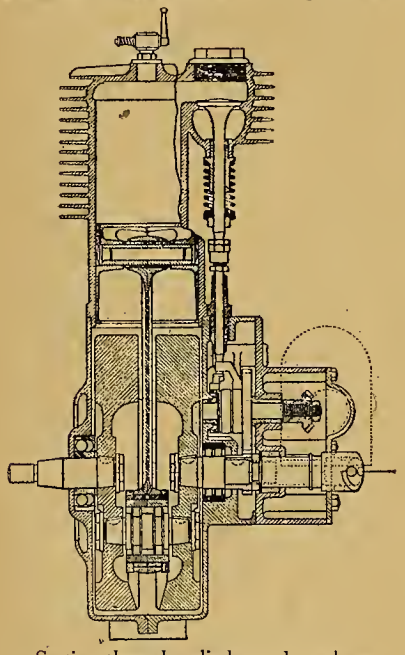
In America the sporting side of motor cycling is more frequently centred in track racing than in trials such as we hold. Pure speed work fascinates the Americans more than reliability, hence the numerous racing tracks in that country. The photograph gives a good impression of a sidecar race held recently in Wheeling, W. Va.

THE PRECISION "BIG" TWINS.

Three New Models:
Air-cooled 8 h.p., 85 × 85 mm., 964 c.c.,
Air-cooled 10 h.p., 85 × 96 mm., 1,096 c.c.
Water-cooled 10 h.p., 85 × 96 mm. 1,096 c.c

THREE new models of V twin engines, which will interest manufacturers of high-powered motor cycles and of cycle cars, have been introduced by Messrs. F. E. Baker, Ltd., makers of the well-known Precision engine units.

Two of the engines are intended for light passenger machines of the runabout type, but the water-cooled 10 h.p. model should be quite suitable for "light" cars,



Section through cylinder and crank case of the cycle car model, showing the magneto drive by bevel gear.

while the smaller unit no doubt will be found on many full-powered motor cycles when the Precision factory once more gets into full swing.

Excepting in size, cooling systems, and the magneto drive, the three engines are identical, and embody an entirely re-designed timing gear. Instead of the two cam wheels of the earlier designs, a single gear wheel is employed, which is integral with the three cams and shaft. One cam operates both exhaust tappets, the inlet valves being served by separate cams.

A Simplified Timing Gear.

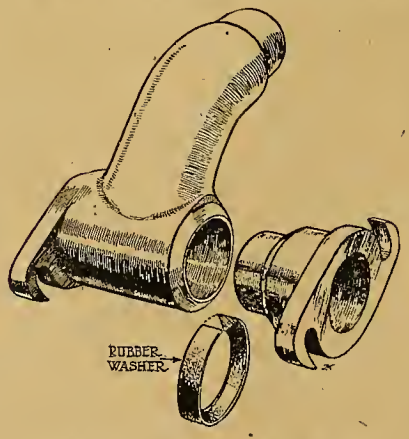
Four rocker levers of sturdy design are used. The two exhaust levers, which are carried on a shaft directly above the cam wheel, give an increase of movement to the tappet over that given by the cam, but the inlets have a direct lift. All rockers have semi-cylindrical ends where they meet the cams.

The exhaust valve lifting mechanism is enclosed in the case, and consists of two small cams, which operate on the undersides of the rockers. These cams are connected by means of levers and a long link, shown in one of the illustrations. The operation is by means of a plunger, which passes through the timing case, and which bears upon a lever actuated by a Bowden wire.

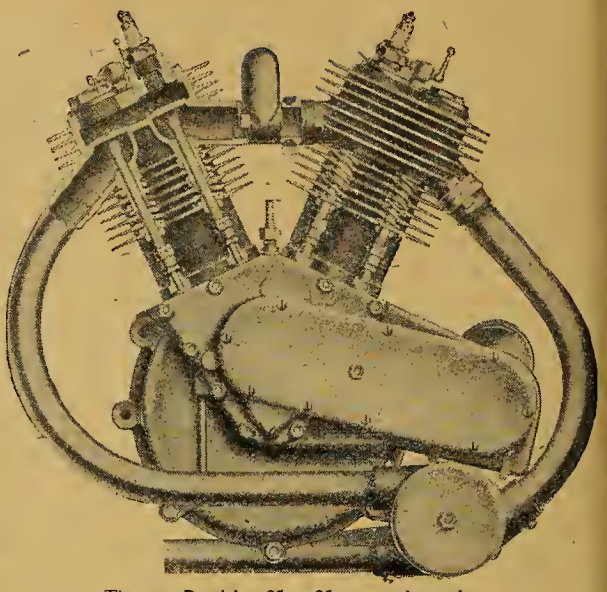
Particularly heavy flywheels are used—a desirable feature in cycle car engines—carried on shafts of ample dimensions. A Skefko radial bearing supports the driving side shaft, while a double row roller bearing is fitted in the timing side. The big end bearing, too, is of the latter type, employing two rows of rollers supporting the forked connecting rod, upon which the other connecting rod works on a phosphor-bronze bearing of good width.

Air Leaks Eliminated.

As on the majority of previous Precision engines, the cylinders of the air-cooled models have radiating fins cast square instead of concentric, which is more general practice. The valves are large and the pockets give an easy sweep for both incoming gas and the exhaust. A feature which will greatly facilitate easy starting and slow running is the "stuffing box" device on the intake valve stems. This consists of a cup having a flange at its upper end and a hole at the base through which the valve stem

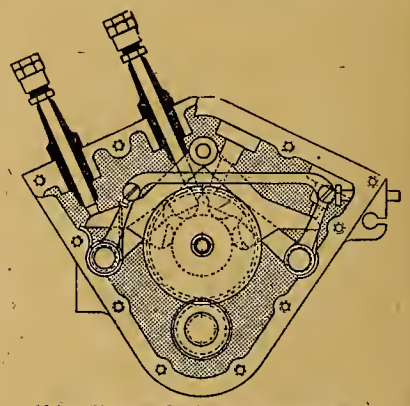


The induction pipe with the V sectioned rubber ring which makes an airtight connection.



The new Precision 85 × 85 mm. twin engine.

works. This is slipped on to the valve guide, and is held in position by the spring which bears against the flange mentioned. Between the lower end of



Valve lifter mechanism and timing gear.

the valve guide and the bottom of the cup there is a space which is filled with asbestos string to prevent air leaks.

Effective Crank Case Release.

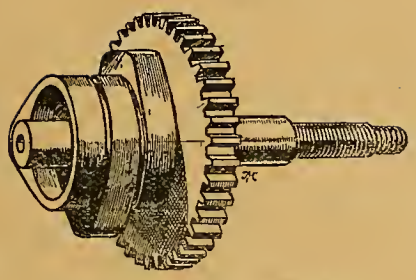
On the cycle car engines, the magneto drive is by means of a bevel gear on the half-time shaft, the magneto being carried on a platform which is cast integral with the timing case cover. The motor cycle model employs chain drive and the platform is also integral with the cover, and is further supported by a bracket which is part of the crank case casting. Lubrication is by splash system, and the crank case is fitted with a simple form of "breather," which consists of a small port, between the crank case and timing case. This is covered, on the upstrokes of the pistons, by a leather disc held in position by a light single leaf spring. The timing case cover has an oil vent which carries superfluous oil clear of the engine.

The induction pipe is quite short, and by means of slotted holes in the flanges

The Precision "Big" Twins.—

may easily be removed. The induction pipe is a casting, having an extension for the carburetter, which curves upwards, and the horizontal portion is made in two pieces, one telescoping into the other, an air-tight joint being made by a V-sectioned rubber ring, which fits into the diagonally cut walls of the pipe, and is held by a hose pipe tension ring. This feature allows the two flanges to be drawn up tightly against those on the cylinders, and air-tight joints can thus be made, which, with the inlet valve guide packings, secure an entire absence of air leaks seldom attained on V twin engines; easy starting and slow running are consequently assured.

There is little of a startling nature in these new model Precision engines, but, produced as they are by a firm of the widest experience, they impress us as being of sound commensense design, and of such construction that there is every promise of great satisfaction on the part of the user. We understand that several manufacturers are interested in the engine, and that shortly Precision-engined "big twins," cycle cars, and motor cycles will be offered to the public.



The half-time wheel with three cams and shaft integral.

Open Reliability Trial for Miniatures.

A Midland Trial for Motor Cycles of Less than 230 c.c.

SINCE a Levis of less than 200 c.c. capacity accomplished everything required of all competitors in the Victory Cup Trial, which included such hills as Rising Sun (Gamble's Lane), near Cheltenham, one may expect little difference in the course chosen for a lightweight trial and that planned for all types of machines. The Sutton Coldfield A.C. is organising a lightweight trial to take place on the 26th inst. for the Calthorpe Motor Cyclette trophy, valued at one hundred guineas. The course, which is not at all severe, will start at the George in the Tree Hotel, Berkswell, at 2 p.m., and will include Kenilworth, Warwick, and Sunrising Hill to Banbury. The return journey will include Edge Hill. On Sunrising there will be a stopping and restarting test on the outward journey, and competitors will be timed on Edge Hill on the homeward route. 200 marks will be credited to each competitor at the start, and deductions will be made for stops *en route* and failures on tests. The schedule time will be worked out at 20 m.p.h. for the orthodox machines; 15 m.p.h. for scooters, if such machines are entered. In addition to the premier award, gold medals will be awarded as second and third prizes, and to all making non-stop runs and obtaining full marks. A special gold medal will be awarded for the best performance on a scooter, if two or more enter. The entry fees are 21s. and 10s. 6d. for non-members and members of the Sutton Coldfield club respectively, and the entries of all competitors must reach the secretary, Mr. F. W. Finnemore, A.C.A., 122, Colmore Row, Birmingham, before Monday, the 21st inst.

Novelty in Competition.

ON the 25th and 26th inst. the Liverpool M.C. will hold an open twenty-four hour trial, starting from three points, *i.e.*, Liverpool, London, and the Midlands. The route will include Warrington, Acton, Tarporley, Whitchurch, Newport, Weston, Brownhills, Castle Bromwich, Stonebridge, Coventry, Daventry, Weedon, Towcester, Fenny Stratford, Dunstable, St. Albans, Chipping Barnet, Oldgate House, Highgate.

Competitors starting from Liverpool will ride *via* Stonebridge to London and back to Liverpool. Midland competitors will start from Stonebridge and ride to Liverpool, then to London, and return to Stonebridge, and the London entrants to Liverpool and back to Highgate, their starting point.

Different coloured number cards will be issued at each starting point to prevent confusion. White for the Liverpool entrants, red London, and yellow Stonebridge. Checks will be at Liverpool, Stonebridge, and London only, but competitors may be timed *en route*; any rider found fifteen minutes ahead of his schedule time will be disqualified.

The timing will be done on the competitors' own watches, which will be sealed, and a start will be made at 9 a.m. from St. George's Hall, Liverpool, Stonebridge Hotel, on the Coventry-Birmingham Road, and the Oldgate Hotel, Highgate. A 20 m.p.h. schedule will be arranged, due allowances being made for the various 10 m.p.h. speed limits to be met with on the route.

Entries close on the 18th inst., and forms may be obtained from the organising secretary, Mr. L. V. Barton, Shaftesbury Hotel, Liverpool.

HILL-CLIMB AT STILE COP.

IF only because it is the first important open hill-climb to be held in the Midlands since the signing of the Armistice, the Sutton Coldfield A.C.'s event on Saturday, the 19th, should attract a good entry. The venue, as before the war, will be Stile Cop, near Rugeley, Staffordshire, and seventeen classes will be catered for as under :

Class 1.—Singles and twins up to 230 c.c.
" 2.—Singles and twins 230 to 275 c.c.
" 3.—Singles and twins 275 to 300 c.c.
" 4.—Singles and twins 300 to 350 c.c.
" 5.—Singles and twins 350 to 500 c.c.
" 6.—Singles and twins 500 to 600 c.c.
" 7.—Singles and twins over 600 c.c.
" 8.—Scooters.
" 9.—Sidecars up to 400 c.c.
" 10.—Sidecars 400 to 600 c.c.
" 11.—Sidecars over 600 c.c.
" 12.—Three-wheelers.
" 14.—Light cars under 1,100 c.c.
" 15.—Light cars 1,100 c.c. to 1,500 c.c.
" 16.—Cars. Open to any member who has never won a prize in any hill-climb promoted by a club.
" 17.—Unlimited motor cars.

A competitor may only enter one machine in each class.

The formula used will be as follows :

$$\frac{\text{Weight}}{\text{Cubical capacity} \times (\text{time})^2}$$

Entry fees for Classes 1 to 12 : 7s. 6d. non-members, 5s. members; Classes 14 to 17 : 21s. non-members, 15s. members.

Entry forms may be obtained from Mr. F. W. Finnemore, A.C.A., 122, Colmore Row, Birmingham.

COAL—ITS WASTE AND POSSIBILITIES.

THE Automobile Association Fuel Department, combined with Messrs. Gaumont and Co., etc., have produced, and shortly will display publicly, a film illustrating most admirably the possibilities of coal if used scientifically. The film opens with a series of pictures of the extravagant, wasteful methods now in general use, then step by step follows out the manufacture of the by-products from coal. Benzole, tar, fuel oil, manure, saccharine, carbolic acid, ammonia, and coke are recovered; from them other things, such as pig-iron and steel, come; and the whole series is illustrated by pictures of battle cruisers, M.L.'s, destroyers, bridges, buildings, and lastly the motor car and motor cycle using benzole. Incidental to the latter is shown the first-aid motor cycle and box sidecar used by the A.A. for taking repair kit to stranded cars. Another scene portrays the scout helping a motorist to find his way in difficult country.

U.S. War-worn Motor Cycles.

A report from Washington, U.S.A., states that very few, if any, motor cycles will be sold by the U.S. War Department at public sales.

Police Trap.

We have received information of a police trap worked as late as 9.30 p.m., at Cobham, on the road from Wisley Hut leading to the top of Pains Hill. This is the first trap we have heard of worked by the Surrey police for many years.

For Meritorious Service.

Congratulations to R. Bownass—ex-competition rider, who has been awarded the Meritorious Service Medal. Bownass was best known as a rider of Matchless and N.U.T. machines. He joined up in 1915 as artificer, through *The Motor Cycle*, in the Motor Machine Gun Service, and was with the No. 8 Battery, M.M.G.S. For two and a half years he has been a motor cyclist at Headquarters, Boulogne.

Two Hundred A.A. Road Patrols Wanted.

The Automobile Association has immediate vacancies for 200 additional road patrols. Preference will be given to ex-Service men with knowledge of first aid, ability to effect small roadside repairs to cars or motor cycles, and experience in removing and replacing motor tyres. Applicants should write in the first instance to the Road Manager, A.A. and M.U., Fanum House, Whitcomb Street, London, W.C.2, stating age, married or single, and previous experience.

The services of the patrols are widely appreciated. At the present time they are rendering valuable assistance in recovering stolen cars and motor cycles.

The patrols carry "first aid" outfits, and frequently render "first aid" services to the public. One patrol recently saw a child floating down a swiftly running river. He obtained the necessary assistance for rescuing the child, who was brought out of the water unconscious. He then utilised his knowledge of first aid, with the result that the patient was ultimately handed over to her parents little the worse for her adventure.

Trial Regulations on a Postcard.

The York and District M.C. has followed the example set by *The Motor Cycle* staff in the recent private trial, in having the regulations and route card printed for its trial on a card not larger than a postcard.

From an Exile.

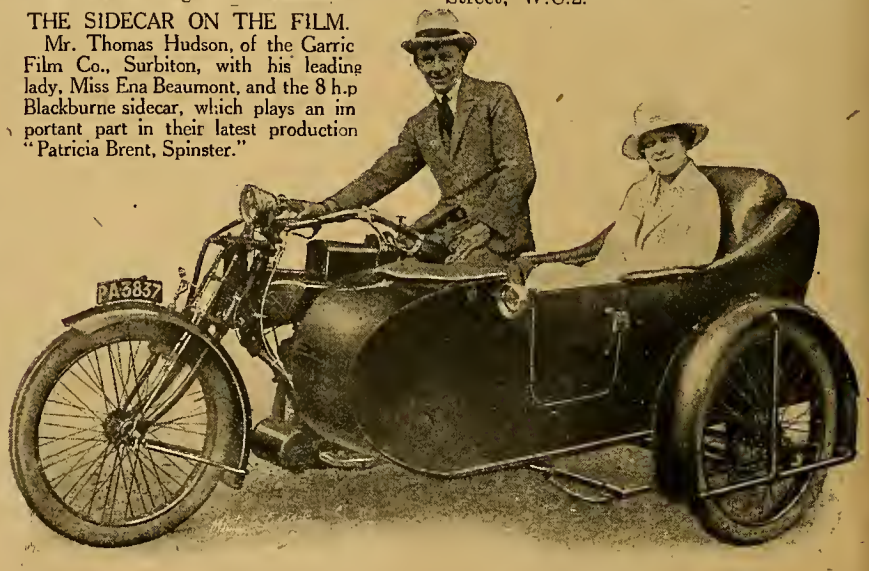
The trials secretary of the Birmingham M.C.C. has just received an entry form for the Easter Victory Cup trial from Cpl. Bourke, D.C.M., M.M., who is exiled in Batoum. Before the war Bourke was a competition rider, and he sent the entry form, together with entry fee (fifty kopecks) "just to keep his hand in."

Ferry Charges.

Our books department have been recently revising a list of ferry charges and tolls in connection with a new edition of *The Motor Cycle* Route Book guide. It is interesting to note that the Southampton, Isle of Wight, and South of England Royal Mail Steam Packet Co., Ltd., of Southampton, in revising their post-war charges for the carriage of motor cycles from Southampton to Cowes (I. of W.), charge five shillings for a sidecar with one seat, and ten shillings for a sidecar with two seats, the pre-war charge for a sidecar being one shilling and one shilling for a motor cycle. The revised charges will probably be of interest to tourists who may be contemplating a trip in the Isle of Wight this summer.

THE SIDECAR ON THE FILM.

Mr. Thomas Hudson, of the Garric Film Co., Surbiton, with his leading lady, Miss Ena Beaumont, and the 8 h.p Blackburne sidecar, which plays an important part in their latest production "Patricia Brent, Spinster."



Special Features.

THE SIDECAR ALTERNATIVE.
THE ARBUTHNOT TROPHY TRIAL.
THE CROSS-HEAD PISTON.

Midland Fire.

The Premier Motor Co.'s premises at Birmingham were burnt out last week.

French Import Tariffs.

The following import tariffs for motor cycles and bicycles have been fixed by the French Customs Authorities: Vehicles under 500 kilos (9 cwt. 3 qrs. 8 lb.) emanating from Europe (exclusive of the enemy countries—Germany, Austria-Hungary, and Bulgaria)—220 francs per 100 kilos (about 9d. per pound), plus 15% *ad valorem*. From U.S.A., 250 francs per 100 kilos (about 10d. per pound), plus 15% *ad valorem*.

Eleven Hundred Firms Supplying Benzole.

The Fuel Department of the Automobile Association and Motor Union have issued a decidedly useful handbook, giving the names and addresses of 1,100 firms stocking benzole. It is classified in geographical sections to facilitate quick reference, and will be appreciated by touring motor cyclists who desire to encourage the production of home-produced fuel. This can be obtained from the A.A. and M.U., Fanum House, Whitcomb Street, W.C.2.

Surrey M.C.C. Reformed.

The above club has been amalgamated with the Farnham and District M.C.C. The opening run will be a reliability trial, Guildford to Exeter, when the Triumph cup for the best performance by a single-cylinder machine will be awarded. The joint secretaries are Messrs. R. W. Watts and A. F. Bateman, Arundel Fairfield, Farnham.

A Redditch Open Trial.

The Redditch and District M.C.C. are organising an open trial to take place on August 23rd, when the B.S.A. challenge cup (value £75) will be the premier award. The Enfield Co.'s inter-team cup, to be won outright, and the Terry cup will also be among the awards. The hon. trials sec. is Mr. F. W. Viles, Headless Cross, Redditch.

Scottish Six Days Trial.

The following entries have been received for the Scottish Six Days Trial first ballot:—

J. A. Newman (3½ Sunbeam)
Jas. Beck (3½ Sunbeam)
A. H. Alexander (——)
H. Macrae (7-9 Harley-Davidson)
C. S. Burney (——)
J. Shepherd (5-6 Campion)
H. Alexander (——)
T. C. De la Hay (3½ Sunbeam)
J. Dudley (3½ Sunbeam)
J. R. Alexander (——)
D. S. Milne (3½ B.S.A.)
R. Spence (4¼ B.S.A.)
D. S. Alexander (——)
Hugh Gibson (8 Clyno)
Frank Smith (8 Clyno)
J. W. Willis (——)
A. G. Cocks (Clyno)
A. F. Knight (Clyno)
J. Robertson-Brown (10 Henderson)
H. Gold (——)
J. S. Holroyd (Blackburne)
P. J. Enticknapp (Blackburne)
T. Lennie (——)
L. B. C. Cunningham (10 Morgan)
J. A. W. Beaton (——)
C. Duncan (2¾ Douglas)
F. J. Hutchison (——)

Appropriate.

All who knew the late Sir Robert Arbuthnot, Bart., K.C.B., M.V.O., agree that last week's trial was one such as would have delighted the sporting admiral. Moreover, the trophy has been won on one of his favourite mounts.

Indian Prices.

We are in receipt of a leaflet referring to the latest model Indian Powerplus sidecar. In it the prices for 1919 are given; motor cycle only, £128; with sidecar, £158; sidecar only, 30 gns. The Hendee Manufacturing Company state that they hope to be able to maintain these prices throughout the season, but it must be understood that orders are only accepted subject to machines and sidecars being supplied at prices ruling at the time of delivery.

Irish Twenty-four Hours Trial.

The Committee of the Dublin and District M.C.C. has made the following awards in connection with its twenty-four hours trial mentioned on page 37:

SPECIAL GOLD MEDALS.—J. Brown (2¾ Douglas), Hugh Gibson (8 Clyno sc.), T. Woods (4¼ B.S.A.), E. B. Russell (4 Triumph), and J. Healy (4¼ B.S.A.).

CLUB GOLD MEDAL.—W. J. Chambers (4¼ B.S.A. sc.).

SILVER MEDALS.—Dene Allen (3½ Norton), J. P. Frost (2¾ Douglas), S. J. Redmond (7-9 Indian sc,), and A. G. Cocks (2½ Clyno).

SPECIAL AWARDS.—Unlimited sidecar prize: Hugh Gibson (8 Clyno), Hutchinson gold medal. Lightweight prize: Maj. A. H. Waters (Baby Triumph), club gold medal. Passenger machine under 600 c.c.: W. J. Chambers (4¼ B.S.A. sc.). Team prize: B.S.A. team (Messrs. Woods, Healy, and Chambers).

Edinburgh M.C. open hill-climb at Reastone Rigg on Saturday. A. H. Alexander (7 h.p. Indian), who made fastest climb of the day.

Speed Judging.

The Coventry and Warwickshire Club held a paperchase and speed judging competition last Saturday in which twelve riders competed. The first prize in the solo class was awarded to G. White (4 Triumph); sidecar class, H. Nelson (Rudge sc.); car class, M. Anderson (10 Humber).

Fire in Motor Cycle Works.

We learn that, in spite of the fire (see previous page) at the Premier Motor Co.'s premises recently, no delay will occur in the delivery of new machines to those who have booked orders. Spare parts, however, cannot at present be supplied for Rex-Jap machines, nor any repairs undertaken.

The War Motors Association.

In the issue of the 26th ult. we gave some particulars regarding the War Motors Association, 240, High Holborn, London, W.C.2, and we now learn that Mr. A. Armitage, a member of the committee of the R.A.C., and a gentleman who has long been connected with the automobile movement, has accepted the chairmanship of the Executive Committee of this body. Mr. Armitage is also the Chairman of the Central Committee for the Employment of Discharged Soldiers and Sailors, a body working in connection with the War Motors Association.

We talked over the work of the War Motors Association with Mr. Armitage recently, and he told us that the Association was doing an exceedingly good work, in that it was seeing that discharged service men could get motor vehicles necessary for their businesses at extremely moderate prices. The ordinary reader knows well enough the difficulty of purchasing a motor bicycle at the present time, and any scheme which will help the ex-service man to purchase a mount at a reasonable figure is deserving of every encouragement. The difficulty at the present time seems to be that of persuading the authorities to get on with the repairs of Army motor cycles with the utmost possible speed, as the demand for them is quite extraordinary. Until recently, some 2,000 applications had been received through the A.C.U. from ex-service men for Government machines.

So far, the authorities have decided to allot 25% of the vehicles at their disposal to the War Service Association, and under this arrangement the demand considerably exceeds the supply. The scheme, however, is an excellent one, because it enables the Government to get rid of its numerous unwanted motor cycles in a simple manner, and at small expense, as the cost of an auction and the cost of printing numerous catalogues and extensive advertising is saved.

We were told by Mr. Armitage that the machines are sold at their present ordinary value, not the inflated present market value, and only a small commission (2½%) is charged for administration expenses.

A Side Show.

Last Saturday the A.C.U. officials at the Arbuthnot Trophy Trial were shown over a submarine by Lieut. G. P. Glen Kidston, R.N., one of the competitors, who, during the war, served in this class of vessel.

THE ARBUTHNOT TROPHY TRIAL.

First A.C.U. Two Days' Naval Event a Success.

FIRST DAY.—Circular Run from Plymouth, 125½ Miles.

Plymouth, July 4th, 1919.

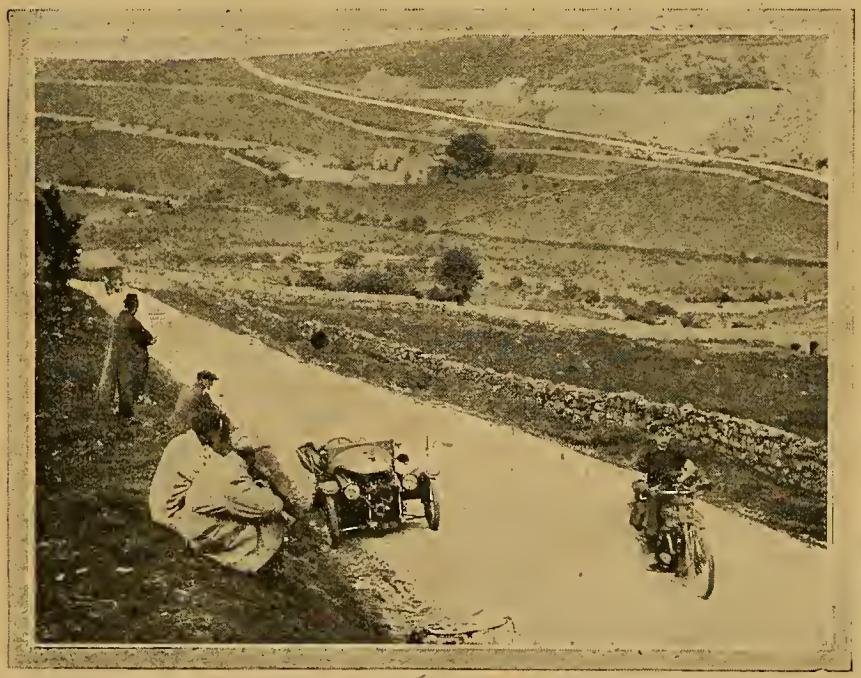
THE Arbuthnot Trophy, a statuette of the late Rear Admiral Sir R. K. Arbuthnot, Bart., executed by Lady Scott, is put up for competition amongst naval officers by the Auto-Cycle Union as a memorial of his gallant death in the face of a vastly superior force of the enemy in *H.M.S. Defence* during the early stages of the Jutland battle. The holding of this competition was first suggested by a member of the staff of *The Motor Cycle*. This is, of course, the first occasion of this trial being run, and it seems rather disappointing that, from the hundreds of officers of the Royal Navy, only twenty-two figured in the programme. The reasons for this are several. For some cause or other the nature of the trial does not appear to have been fully realised by naval officers. The mention of the trial in Admiralty orders was a trifle late, the holding of the trial so near to the signing of peace caused some difficulty in getting leave. Of the competitors, Major W. P. Arbuthnot, R.M.L.I., was a cousin of the late Sir Robert, and entered, so he told us, for the "honour of the family." Lieut. Terence Back, R.N., was nephew of the late Captain Back, R.N., who perished in *H.M.S. Natal* owing to an internal explosion with all on board. Sub-lieut. C. P. Glen-Kidston, R.N., served with Sir Robert in *H.M.S. Orion*, as a midshipman. There were six non-starters, and of these Lieut. H. C. Dains, R.N., had a fall on the way down to Plymouth on Thursday, and was too much shaken to ride.

Lt. W. Derek-Stephens (2¾ h.p. Douglas) and Sub.-Lt. C. L. Laurie (P. and M.) on a hill near Huccaby

The Start.

The start, at one-minute intervals, commenced at 9 a.m. from Andrews's Garage in perfect weather, and a different order of starting was instituted after lunch the first day, next morning, and after lunch the second day. The first early stage of the trial presented no difficulties, and starting early on a new make of two-stroke, complete with clutch and kick-starter, the 2¾ h.p. Villiers engined Ruffles, we made a good run to Merrivale, where we stopped each competitor and gave him his instructions as to the consistent driving test. Each man had to descend from this point to Mr. Loughborough, who sent him off when the road was clear. His time was taken from the crest of Merrivale Bridge, and his speed to a certain tarred line some way up the hill had not to exceed 10 m.p.h., while the remainder of the course, up to a flag almost on the summit, had to be covered at a speed of not less than 15 m.p.h. The same procedure is followed to-morrow, and the competitor who most nearly repeats his previous day's performance will be adjudged to be the winner. Even at this early stage of the trial some incidents had taken place.

Lt. Marriott (Norton) arrived with his face bespattered with oil, as he had forgotten to screw up the oil tank filler cap. Early among the competitors there arrived the Rev. E. P. Greenhill in one of the 1920 Matchless sidecar outfits, with C. E. Cuffe (a pre-war trials competitor) as passenger. Mr. A. V. Ebblewhite, who was a passenger in Mr. Loughborough's Morgan, took the times.



Sub-Lt. R. N. Everett (4 h.p. Triumph) in the consistent driving test on Dartmoor.

Across the Moors.

Beyond Two Bridges the course followed was towards Ashburton and on to Hexworthy (Huccaby in the programme), where three moor gates had to be opened. Plenty of sheep and cattle were encountered on different parts of the course, and near the last-mentioned point. Immediately after, followed one of the trickiest parts of the course, which was encountered in the Holne Chase district. This was a V bend, followed by a pitch of 1 in 6, which spoiled the hitherto clean sheets of several of the competitors.

Near Bovey, Sub-Lt. Pollock (Harley-Davidson) completely smashed up his mount on a down grade through the brakes failing to act. Fortunately, he

An involuntary stop on the moors near Holne.

escaped without injury. This news was brought by Rex Mundy, who was driving a Matchless outfit, and was supervising the arrowing of the course. Onwards from Moretonhampstead to the luncheon stop at Exeter all was plain sailing.

After lunch the road was rough and rutty, and there was an exceedingly tricky section between Tedburn St. Mary and Moretonhampstead. This consisted of Brook Hill, which necessitated the negotiation of a watersplash, a long steep ascent from Clifford Bridge, and a precipitous and very tricky descent with very rough surface before the main road was reached.

At Two Bridges we found Lt. Hamilton (Levis) in trouble with his rear tyre, while Lt. Thompson (P and M.) reported that he had retired owing to lubrication difficulties. More hilly country was encountered near Chagford, while the road near Lee Moor Clay Works was distinctly greasy. Here Lt. Derck-Stephens (3½ h.p. spring frame Douglas) had a bad side-slip, which was hard luck, as he damaged his footrest. This he was allowed to have made usable.

The following are the first day's results:

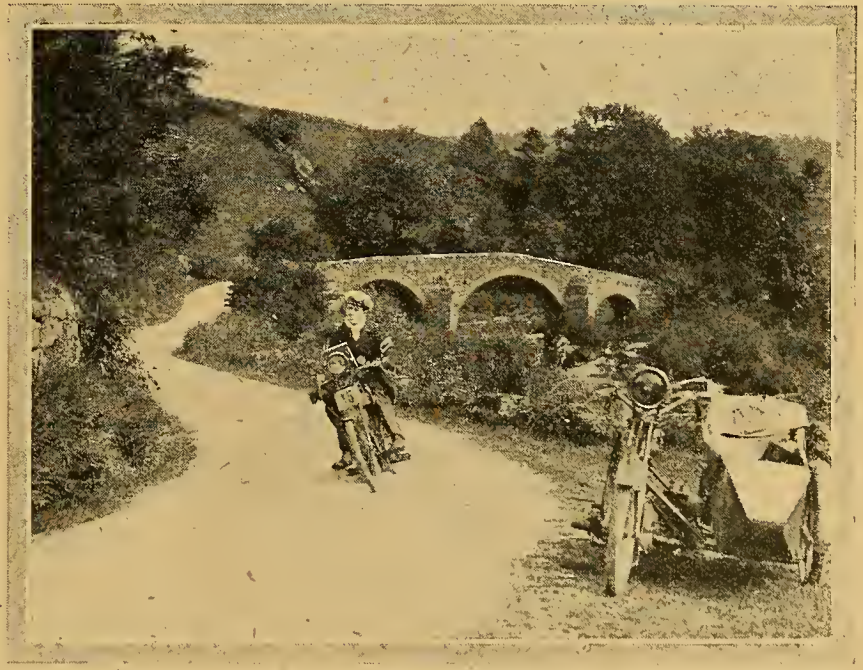
1. Sub-Lt. G. S. M. Pollock, R.N. (7-9 Harley-Davidson), retired, brake failure.
2. Maj. W. P. Arbuthnot, R.M.L.I. (6 Enfield), retired, lost way.
3. Sub-Lt. R. N. Everett, R.N. (4 Triumph), one stop.
4. Lt. Marriott, R.N. (4 Nortoo), one stop, failed Merrivale.
10. Lt. H. T. Back, R.N. (4 Triumph), non-stop.
11. Lt. C. J. M. Hamilton, R.N. (2¾ Levis), retired, puncture.
12. Lt. W. W. Jacomb, R.N. (5-6 James), 36m. late.
13. Sub-Lt. W. S. Jameson, R.N. (2¾ Diamond) one stop.
14. Lt. E. S. K. Evans-Greaves, R.N. (4 Triumph), non-stop.
15. Sub-Lt. C. P. Glen-Kidston, R.N. (3½ Sunbeam), non-stop.
16. Lt. W. Derek-Stephens, R.N. (3½ Douglas), two stops.
17. Sub-Lt. C. L Laurie, R.N. (3½ P. and M.), two stops.
19. Actiog-Lt. A. G. Elliot, R.N. (4 Douglas), four stops.
20. Lt. D. S. E. Thompson, R.N. (3½ P. and M.), retired, left route.
21. Lt. J. S. Bethell, R.N. (2½ Allon), retired, broken chain.
22. Engr.-Lt. B. Collinson, R.N. (2½ Allon), nine stops.

SECOND DAY.

This morning we waited to see the start, which was worth while, as for the first time in an A.C.U. trial the competitors were not allowed to run their engines before starting the day's run; consequently it was interesting to see how they would behave. Sub-Lt. Jameson's J.A.P.-engined Diamond started very easily. One of the favourites, Lt. E. S. K. Evans-Greaves, started with a very soft rear tyre, which had to remain soft till the end of the run. His engine was very stiff, but fired after a few attempts with the starter pedal. Eng.-Lt. Collinson's Allon fired very promptly, while Sub-Lt. Everett's Triumph started at the second kick. This officer, who looked, and probably was, the youngest competitor in the trial, stood a good chance in the early stages of having a clean sheet, as he rode consistently and well, but he made one mistake to-day; he took a corner too fast, and ran into the bank. Sub-Lt. Glen-Kidston (Sunbeam), a hot favourite, made a good start, as did Sub-Lt. Laurie (P. and M.). These two were notable as the only officers to ride in uniform. Lt. Terence Back (Triumph), the third favourite, started his engine after about the third attempt. Acting-Lt. A. C. Elliot (4 Douglas) returned to the garage a few minutes after he had started. The fibre shoe of his back brake swelled, and locking the back wheel on two occasions caused a couple of violent skids. This occasioned his retirement.

Stiff Gradients.

The gem of the morning proved to be Denham Bridge, a steep hill with a fairly good surface and a gradient of about 1 in 4½. It was somewhat like the Clifford Bridge Hill in yesterday's run. Most of the survivors made good ascents. The next portion of the journey included the ascent of Gunnislake Hill, on the main Bodmin road. This is an interesting ascent, and it is probably the longest on any main road in England, and is as steep as 1 in 5-6 on the stiffest portion. Needless to say, it caused no trouble to the survivors' machines, as it is well within the capabilities of the modern motor bicycle. Near Looe some steep hills had to be climbed; their surface was good, but on the summit of one there was a short patch of real grease, which fetched Laurie off his machine—his second fall that morning.



Sub.-Lt. G. P. Glen-Kidston (3½ h.p. Sunbeam), snapped on a pretty section of the course between Two Bridges and Huccaby.

The Arbuthnot Trophy Trial.

At lunch at the Royal Hotel, Bodmin, it was certain that the trophy would go to one of the two Triumph riders, Greaves or Back, and, provided neither had a stop, the award rested on the performance of the two in the consistent driving test. This afternoon's route lay over easy country, and only one tricky little hill was encountered out of Tavistock. After a splendid run from Bodmin we came upon the leaders, and were almost within hale of Merrivale, where the deciding test was to be held, when just on the moors our petrol supply gave out, but just afterwards a good Samaritan came along in a pony cart and asked our trouble. On hearing of our empty tank he volunteered to drive home and get the much-needed fuel, and in half an hour he returned mounted on the pony and with a two-gallon tin of benzole slung round his neck. We then set out for Plymouth through Horrabridge, and met the competitors again at Yelverton, whence they proceeded to the last check after a long down-hill run.

So ended one of the best and most sporting trials ever organised, a trial which was highly appreciated by the competitors and organisers The former, as one would anticipate, were the best sportsmen it was possible to find. Several were complete novices, and yet not one of them complained of the task set him—a task which was harder perhaps than was reasonable. Still, the survivors have the satisfaction of having come through a trial worthy of the most skilled experts.

The consistent driving test worked well, and is a happy solution of the difficulty of finding a winner It is fairer than the objectionable secret check, which is un-English. It was exceedingly difficult for a competitor to repeat his performance on the second occasion.

RESULTS.

1. Lt. E. S. K. Evans-Greaves, R.N. (4 Triumph), winner of Arbuthnot Trophy, silver medal, and special award offered by the M.C.C., no stops and fifth best performance in the C.D.T.*
2. Lt. Terence Back, R.N. (4 Triumph), silver medal, no stops and seventh best performance in C.D.T.
3. Sub-Lt. R. N. Everett, R.N. (4 Triumph), one stop and best performance in C.D.T.
4. Lt. Marriott, R.N. (4 Norton), one stop and second best performance in C.D.T.
5. Sub-Lt. G. P. Glen-Kidston, R.N. (3½ Sunbeam), one stop and ninth best performance in C.D.T.
6. Lt. W. Derek-Stephens, R.N. (3½ Douglas), two stops and third best performance in C.D.T.
7. Sub-Lt. W. S. Jameson, R.N. (2½ Diamond), three stops and sixth best performance in C.D.T
8. Sub-Lt. C. L. Laurie, R.N. (3½ P. and M.), four stops and eighth best performance in C.D.T.
9. Lt. W. W. Jacomb, R.N. (5-6 James), two stops and fourth best performance in C.D.T., but 36m. late in on Friday.

*C.D.T.=consistent driving test.

Glasgow M.C.C. Open Twelve Hours' Trial.

A Disappointing Event.

FOR their twelve hours' open trial, last held in 1914, the Glasgow club originally intended to go further afield than usual, and include in the route a part of the course to be covered by competitors in the forthcoming Scottish Six Days. It was ultimately decided, however, to revert to the 1914 course.

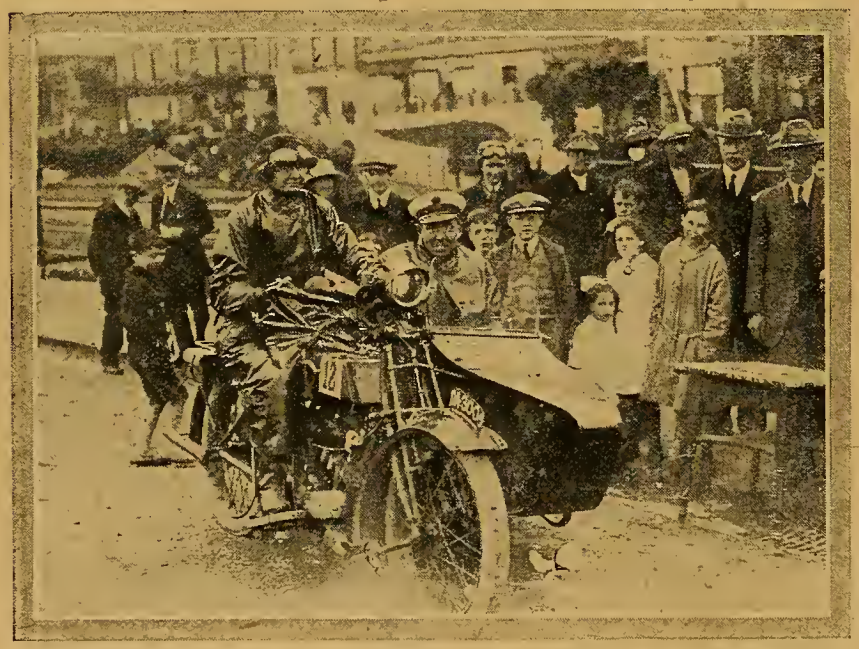
Whether it was due to the holiday season, or the counter attraction of the Edinburgh M.C. hill-climb, is hard to say, but only the very poor entry of fifteen, including a lady driver of a sidecar outfit, had been received by the secretary up to the time of starting.

The first part of the journey was comparatively easy, and the majority checked in at Arrochar to time. B. R. Parsons, who essayed to take a 2¾ Douglas sc. round the route, had a mix-up with a hay cart in Bonhill and retired.

Mrs. D. Bell (6 A.J.S.) put up a good show, and handled her machine with skill on the hairpin.

Just after leaving Otter Ferry all the riders left in the event went off the course, and found themselves in a farmyard. After losing valuable time, they regained the correct route, and proceeded to Dunoon. Needless to say, the road for the last few miles to this check was fast, but none of the riders checked in to time. Nine competitors arrived at this point, and complained of the lack of arrowing, etc.

All interest had completely evaporated, and several of the riders decided to go no further, preferring the joys of Dunoon to the more strenuous work of the trial. Of the six riders who left after the lunch interval, the following checked in at the finish: W. Deans (3½ Ariel), D. S. Alexander (8 Enfield sc.), Mrs. D. Bell (6 A.J.S. sc.), and I. Bell (6 A.J.S. sc.)



Glasgow M.C.C. open twelve hours reliability trial on Saturday last. Mrs. Bell (6 h.p. A.J.S.), only lady competitor, checking in at Dunoon. She was one of the four competitors to finish and made a very good performance.

M.C. and A.C. "Long Day" Trial, June 26th.

RESULTS.

THE JORDISON TROPHY FOR PASSENGER MACHINES.—L. Newey (4¼ Ariel).

GOLD MEDALS IN PASSENGER MACHINE SECTION.—F. W. Giles (6 A.J.S.), J. Stevens (6 A.J.S.), L. Newey (4¼ Ariel), and H. B. Denley (8 Morgan).

SILVER MEDALS.—F. Smith (8 Clyno), 95 marks; J. E. Greenwood (8 Sunbeam), 92 marks; F. J. Watson (3½ Ariel), 90 marks; and J. L Stocks (6-7 Ariel), 92 marks.

"THE TRADER" TROPHY IN SOLO SECTION OVER 350 C.C.—G. E. Stobart (4¼ James).

GOLD MEDALS IN SOLO SECTION OVER 350 C.C.—G. A. Strange (5-6 James) and H. Stretton Ward (4 Triumph).

SILVER MEDALS.—A. J. Dowler (3½ Sunbeam), 95 marks; J. A. Watson Bourne (4 Blackburne), 90 marks; J. Dudley (3½ Sunbeam), 97 marks; H. Minton (4 Norton), 92 marks; J. A. Newman (3½ Sunbeam), 92 marks; T. Peck (3½ Ariel), 92 marks; and G. Dance (3½ Sunbeam), 98 marks.

CLUB PRIZE.—T. Peck (3½ Ariel), 92 marks.

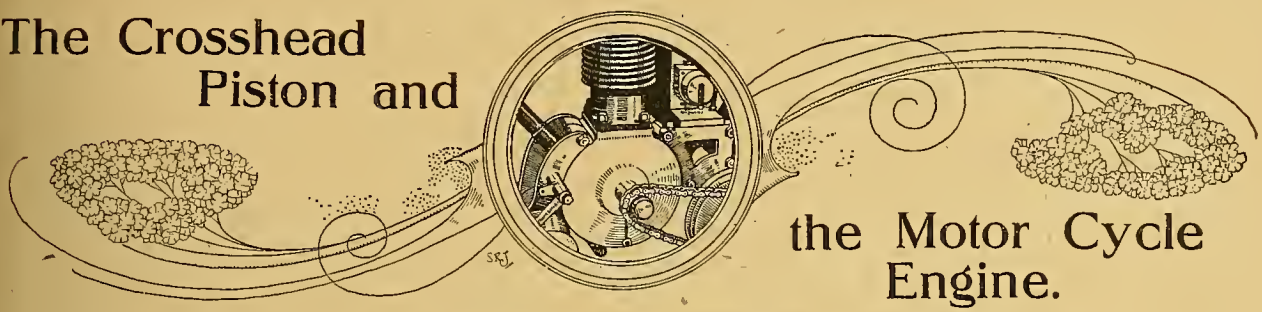
THE "B.N." BOWL FOR LIGHTWEIGHTS 350 C.C. AND UNDER.—Eric Williams (2¾ A.J.S.).

SILVER MEDALS.—H. Newey (2¼ Levis), 90 marks; A. H. Johnson (2¾ Allon), 90 marks; and W. R. Gibb (2¾ Douglas), 92 marks.

SPECIAL PRIZE FOR LIGHTWEIGHT MACHINE UNDER 275 C.C.—H. Newey (2¼ Levis), 90 marks.

The winner of the premier award—the M.C. and A.C. trophy—for the best performance of the day has not yet been decided.

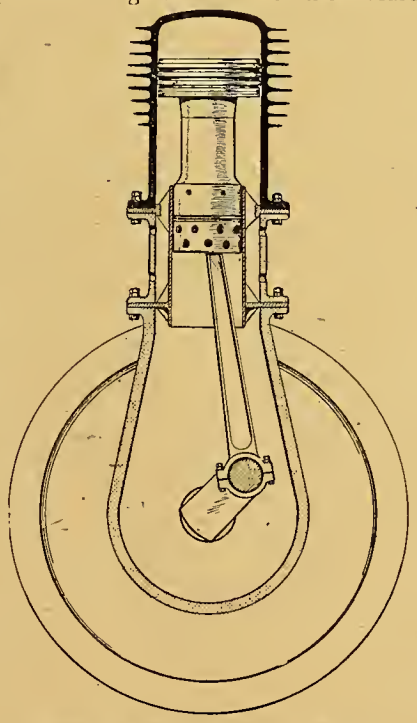
The Crosshead Piston and the Motor Cycle Engine.



An Epoch in the Progress towards the Ideal Machine.

PRACTICE has conclusively confirmed the theory on which the design of the Ricardo crosshead piston is founded, so that there is no need to labour the latter side of the question. It will suffice to summarise the points in which the great advantage is found before considering the applicability of the device to the engine of the motor cycle. The general idea may be outlined as follows:

In place of the usual combined piston and guide (ordinarily the "skirt"), a piston head is constructed of just sufficient depth to take the rings. This is attached to a stem of much smaller diameter, which joins it to the crosshead or guide. The crosshead normally works—*i.e.*, reciprocates—in a sleeve, and so keeps the head in line and prevents any side pressure on the cylinder walls. Advantages directly accruing from this are great reduction in internal friction (piston side pressure causes 80% of the internal friction with the ordinary forms of piston), better cooling and lubrication. These facts have been demonstrated over and over again, and the idea is decidedly not new. Automobile engines with crosshead pistons have been successfully used for tanks and other purposes, so that the theory is fully borne out in practice. Why then is not this type of piston more generally used—particularly with regard to motor cycle engines? The answer may be found in several reasons. First, the crosshead piston is of necessity longer than the ordinary type, which, of course, means a taller engine; secondly, the advantages may not be fully realised by designers who have become so used to the old type which gives a reasonable amount of satisfaction, besides which they fear problems of weight, balance, and complexity; and, lastly, the necessary radical alteration in the designs of years which would be inevitable, and is not favoured by the makers.



Being to scale, this section gives some idea of the proportions of a crosshead-pistoned engine.

Fortunately all these objections can be overcome, although *practically* the process may be a long one, and at present we need a bold pioneer who will put conventional methods and ideas aside, and give the proposition a proper trial

On paper, at all events, there appears to be every prospect of success for the pioneer.

Comparative Size.

An ordinary 3½ h.p. air-cooled four-stroke motor cycle engine with an outside flywheel measures approximately 20in. from the base of the crank case to the top of the cylinder casting. An engine constructed with the Ricardo piston and an outside flywheel, with a stroke of 88 mm., would only be 22in. from the flywheel rim to the top of the cylinder

We see then that the crosshead piston necessitates an engine but slightly longer than one with the skirted piston. The engine could, of course, be inclined similarly to the P. and M. power unit, and in such a position it should not at all detract from the appearance of the machine as a whole, or accommodated similarly to the 750 c.c. Rudge. This latter engine, with *enclosed* flywheels, is 2ft. over all.

Reciprocating Weight.

By far the greatest majority of crosshead pistons constructed so far have been of aluminium, and it is rather surprising to know that they are actually lighter than the ordinary trunk piston, so that they cannot be condemned on the score of excessive weight. At the same time it must be recalled that the principal reason why a heavy piston entails low mechanical efficiency is not, as is so often supposed by the non-technical reader, due to the increased loading on the connecting rod bearing, which is relatively light, since a large proportion of the inertia stresses never reach this bearing. As a matter of fact, it is the inertia forces which constitute a very great deal of the loading of the piston on the cylinder walls, and therefore of piston friction. In the crosshead piston, of course, this loading is transferred from the piston head to the amply proportioned crosshead, which works under ideal conditions of temperature and lubrication. The swept portion of the cylinder, and the piston head too, are adequately lubricated and internally cooled, so that deposit of carbon is practically impossible.

The Crosshead Piston and the Motor Cycle Engine.—

A comparison of the piston weights is given in the following table, taking the three types of piston in aluminium, and the ordinary cast iron piston.

	Aluminium Slipper Piston.	Aluminium Crosshead Piston.	Aluminium Trunk Piston.	Light Cast-iron Piston.
Weight, with gudgeon pin, rings, and crosshead sleeve	0.7 lb.	1.0 lb.	0.95 lb.	1.65 lb.
Weight of total reciprocating mass	1.0 lb.	1.3 lb.	1.35 lb.	2.05 lb.
Weight of total reciprocating mass per sq. in. of piston area	0.079 lb.	0.102 lb.	0.107 lb.	0.163 lb.

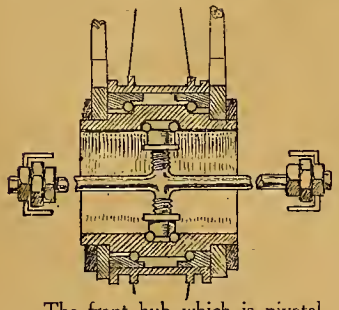
The figures are taken from actual samples in use, and are not theoretical. Of course, the weight of the piston alone is immaterial. It is the weight of the total reciprocating mass which has to be taken into account, and here the crosshead piston scores. A short floating gudgeon pin is used, and as the load is transmitted at points as close together as possible, the tendency to bend the gudgeon pin is reduced, and a shorter and smaller connecting rod small end bearing and gudgeon pin can be used with consequent weight economy.

What will most interest the motor cyclist, however, is a statement of the advantages of this type of engine over the ordinary kinds. First of all, the engine is much smoother running, and is so well cooled internally that overheating and seizing up should be impossible. This would apparently point to the engine being one of the slogging hard-pulling type, most suitable for sidecar work. By the lubrication system great economy of oil is obtained. As stated previously, the mechanical losses are much reduced, which means more power at the road wheel, and should result in a reduction in the fuel consumption. A great point in favour of the adoption of the crosshead piston is that it is a mechanically sound job, which should appeal to the idealist, then the great mechanical saving should recommend it to the engineer, even when the slight extra cost is taken into account. The more one thinks of the advantages of this piston, the more does one become convinced that the day of the old piston is gone if the motor cycle of the future is to be a truly mechanical job. MASCOT.

A Design Eliminating Bicycle Practice.

A Simple Single-track Machine on "Car" Lines.

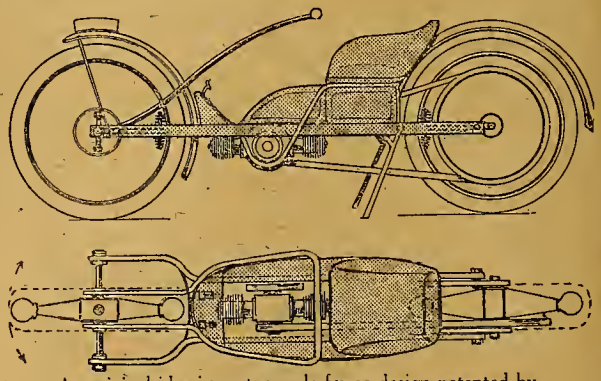
THROUGHOUT the evolution of the motor cycle many attempts have been made to design a single-track machine following car rather than cycle lines. We have from time to time illustrated several examples of such vehicles produced or designed in this country and the United States.



The front hub which is pivotal at the centre of a fixed solid axle.

The accompanying illustration depicts another British design, patented by Mr. L. Graeme Roberts, of Lewes, Sussex, which, it is claimed, gives the rider complete protection all weathers, by means of an "apron" formed by a double steering arm.

It is proposed to construct the frame of two side members of channel steel running from axle to axle, both wheels being sprung. The front wheel has a pivotal hub on a fixed solid axle, and is moved by two steering arms shown in the drawing.



An original idea in motor cycle frame design patented by Mr. L. Graeme Roberts, of Lewes.

Obviously the illustrations are not drawn to scale, and we think that with wheels of conventional size, the wheelbase would be unduly long. The steering, too, might be difficult to get accustomed to. However, the design is interesting as an attempt to get away from ordinary bicycle practice, but only an actual demonstration can decide its practicability.

THE PARIS SHOW.

THE fifteenth International Paris Automobile Show will be held from October 9th to 19th, this year, under the presidency of Baron Charles Petiet. At this exhibition there are usually a number of motor cycle exhibits, which are conveniently stalled, owing to the enormous accommodation of the Grand Palais, under the same roof as the cars.

Certain regulations have been added to those of previous years, which forbid the reception of exhibits by enemy countries, while it is pointed out that exhibitors of allied nations or nations associated with France during the war will be received on the same terms as those of French nationality if they have already taken part in three Paris shows, and provided the Customs duty in their country on French vehicles before August 1st, 1914, was not above 15% *ad valorem*, or the equivalent value. It is also pointed out that the cost of stands, suitably furnished, will be considerably raised. The Commissary-General is M. H. Cézanne, 51, Rue Pergolese, Paris.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address

THE £100 RUNABOUT.

Sir,—Our attention has been drawn to the fact that the suggested name for the lightweight car designed by Mr. G. Slater Booth, of St. Alban's Road, Bristol, and for which we are the sole concessionnaires, has already been protected by the Aero-Car Engineering Co. We hasten to inform your readers that the name shall be changed forthwith, and we gladly express our regrets to the Aero-Car Engineering Co. for the oversight.

BEAUFORT MOTOR AGENCY.
(FRANK BOLWELL.)

GOVERNMENT MOTOR CYCLES.

Sir,—I notice amongst your chat paragraphs on June 26th (page 649) reference to the number of motor cycles purchased by the Government during the war.

These figures appear very short of the actual numbers, despite the official source. In our case alone, it is quite accurate to say that the number of Douglases supplied to the War Office and Admiralty was over 25,000; in fact, considerably more than the total of all makes, according to the figures in your paragraph. DOUGLAS MOTORS, LTD.

AGENTS CHARGING FOR CRATES.

Sir,—You recently published some correspondence relative to agents charging for crates when selling new motor bicycles.

We, as Douglas agents, have consistently charged for crates. In the first place they are non-returnable, and, secondly, the figure at which they are charged to us is very high indeed, and we consider we are justified in our action. Furthermore, in order to know exactly our position, we wrote Messrs. Douglas, Ltd., and they informed us that not only were we absolutely in order in charging for the crate, in addition to the price of the new machine, but we were also in order in charging carriage from Bristol to Cambridge.

ROBINSON'S GARAGE,
H. ROBINSON.

THE PETROL RING AGAIN.

Sir,—A few days ago the Press were good enough to publish a letter from me, stating that the National Benzole Association had informed the Automobile Association and Motor Union that the price of benzole conforming to the specification approved of by the A.A. and M.U. was 2s. 9d. per gallon in two-gallon tins, and 2s. 8d. per gallon in fifty-gallon drums in England and Wales.

This letter has brought up once more the way in which the motoring community is being treated by petrol interests. Letters are being received from all parts of the country, showing that the petrol companies who are distributing a product called "benzole" are charging a price that only enables it to be retailed at 3s. per gallon.

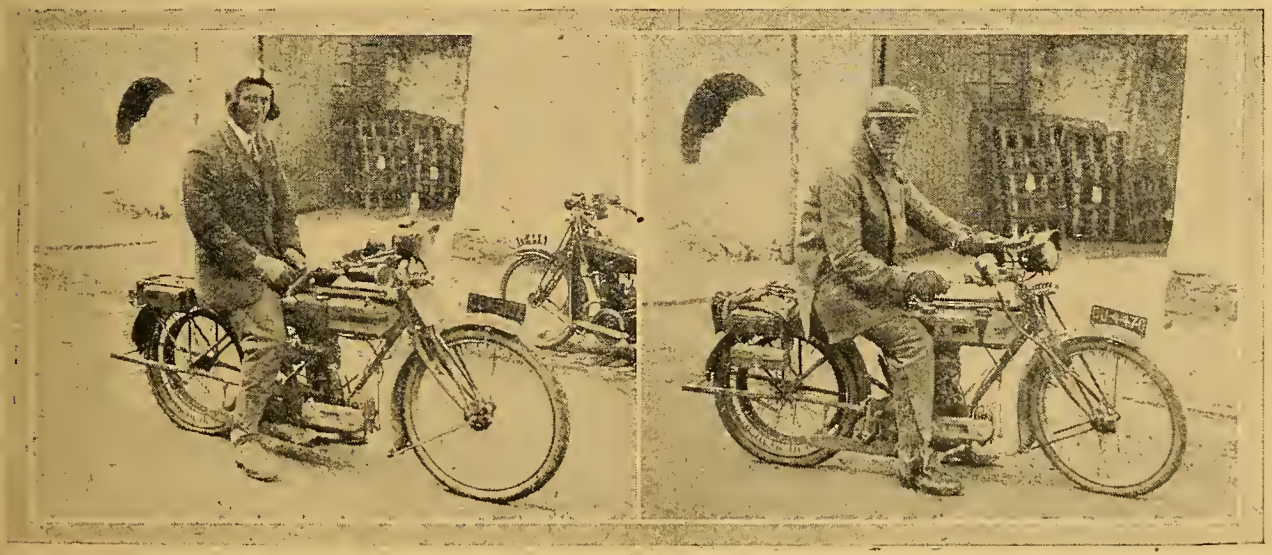
This "benzole" bears no guarantee whatever that it complies with the specification approved by the Association.

One is led to ask, how do petrol companies concerned justify the price of 4d. per gallon more for a fuel that is certainly no better, and often inferior to an article which is recognised as absolutely satisfactory.

The Automobile Association is giving all possible support to the National Benzole Company, which has been formed by the producers themselves, to distribute real benzole. It has been instrumental in getting the benzole company to fix a lower price than has hitherto ruled. It has every hope that this price will be still further reduced, and it now begs all motorists to help that company by insisting on getting benzole which is supplied by the N.B.A.

In order to help motorists to do this, the Automobile Association has prepared a complete list of firms supplying benzole, in which list are clearly marked those firms which supply benzole of approved specification. The Association is prepared, in the interests of the motoring community as a whole, to distribute this list to all motorists, whether belonging to it or not.

STENSON COOKE, Secretary,
The Automobile Association and Motor Union.



First and second in the Arbuthnot Trophy trial. (Left) Lt. E. S. K. Evans-Greaves (4 h.p. Triumph), the winner of the trophy. (Right) Lt. H. Terence Back (4 h.p Triumph), who made the second best performance.

SPARE PARTS.

Sir,—A few days ago I had the misfortune to find the primary screw insulating bush on my E.I.C. magneto broken. I wrote to the makers explaining that I used the machine every day, and asked them to send me a new one per return. By return of post I received a letter from them stating that they had forwarded a new contact breaker and asking me to return the one on my machine. Also there was no charge.

Liverpool. BROADGREEN.

Sir,—With reference to the recent complaints as to the difficulty in getting spare parts, may I suggest that the next time you publish a "Buyers' Guide" that you classify the makers as to their methods of supplying spare parts.

No doubt a good many firms would be A1, but, unfortunately, the makers of my machine are C3 in this respect.

I recently wrote to the makers of my machine for a starting handle, having lost mine. As I received no reply after fourteen days, I wrote again, when I received my letter back which had been written on in pencil: "Write to the makers of the gear box, Messrs. ——, and next time send a stamped addressed envelope." The latter request was borne out by their reply being insufficiently stamped.

If intending purchasers knew those firms who consider their liability has ceased when they have been paid, it would be a great help to your readers. F.L.M.

London, W.

AVERAGE SPEEDS.

Sir,—I was delighted to see Miss E. Manvell's very sensible letter in your issue of May 22nd. Like her, I have a 2¾ Colonial model Douglas, and, without special tuning, the highest speed has been 46 m.p.h. I have gone from Londonderry, through Coleraine, Ballycastle, and round the coast road to Larne—a distance of ninety miles—in exactly three hours—average 30 m.p.h. To do that time, I was going 40 m.p.h. and sometimes over that speed on every possible occasion, and, of course, on this route we have many opportunities for speed bursts—stretches of straight road and very little traffic. I should be keenly interested to read a few more experiences of your contributors on the same subject. GLENGESH.

Londonderry.

THE YOUTHFUL MOTOR CYCLIST.

Sir,—I have read with interest "Considerate's" criticism of the article headed "The Youthful Motor Cyclist."

In this letter "Considerate" states that your correspondent *advocates* fitting a noisy exhaust system. This is not the case. In that article the writer said that he fitted to his *first* machine a large copper exhaust pipe; but he does not *advocate* the idea.

Secondly, "Considerate" condemns "tinkering," showing that he is not blessed with a "mechanical mind" and the love of machinery. He has, therefore, no conception of the amusement that can be derived from "getting inside" a motor cycle engine.

Lastly, in no part of "The Youthful Motor Cyclist" does the writer state that he wears "racing helmets and other ludicrous atrocities," as "Considerate" describes. "Considerate" should not condemn other people's views simply because he differs, he does not represent the whole motor cycling public. J.M.S.

Edinburgh.

FLAT FOURS.

Sir,—It has occurred to me that a four-cylindered h.o. engine resembling, for example, a duplicated Douglas, might be practicable.

I am at present engaged on the preliminary experiments of such a model, but am not yet able to give any details as to its possibilities. So far, however, it seems to be favourably progressing.

My idea is to have the four cylinders arranged in two pairs, those in each pair being superimposed one above the other, or side by side; but while the former design would probably be more suitable for motor cycles the latter would be convenient for light cars, of course with the usual modifications.

I have not heard of this design being built, and so far have yet to discover the reason of the inventor's laxity in this direction. Looking at the matter from a general point of view, there is no apparent obstacle to its construction.

An engine of this design would, with four cylinders, develop, under ordinary circumstances, approximately 6-10 h.p., which would be quite ample for passenger work.

I shall be glad to see readers' criticisms on this matter.

Woodford. R.F.C.

[Engines of the type R.F.C. describes have already been shown in *The Motor Cycle*. The Foresti is an example of a four-cylinder engine, and was fully described on May 9th, 1918.—ED.]

A DANGEROUS HILL.

Sir,—I should like to draw your attention to Hickleton Hill, on the main road between Barnsley and Doncaster. In the centre of this hill there is a very bad blind corner, where numerous accidents have occurred between cyclists and motorists. Recently a really bad accident occurred here, and I think if the matter was mentioned it might do some good. E. SAYLES.

TWIST-GRIP CONTROL.

Sir,—In your issue of May 15th, "Ixion" states: "I wish I knew exactly why a large percentage of big twin buyers in this country prefer Yankee stuff." To my mind the answer is clear, the twist of the wrist control is the secret; I rode American big twins for four years before the war simply on account of this delightful method of control. If any well-known British makers of big twins decide to adopt this twist control, I am certain they will find a big market. CAPTAIN, R.H.A.

Egyptian Ex. Force.

SCOOTERS.

Sir,—A correspondent in your June 26th issue (and a very good number, too) tells us his scooter averages 5 m.p.h. "over vile roads." Yourselves, in your recent trials, found top speed to be about 15 m.p.h. While realising that the scooter is not meant for high speeds or great distances, the question of whether this is good enough (at the price) is rather obtrusive. I would remind you that:

1. A good walker does 4 m.p.h. for hours and hours on nothing but boots and beer.
2. A very moderate cyclist averages 10 m.p.h. (I myself, a motor cyclist since the beginning, and hating push-cycles like poison, can do it.)

Cycles cost £10 to £12, and only require moderate exertion, whereas holding on to a scooter on a bad road on a dark evening would be a considerable test of fortitude.

Let us have the skooter, scooter, skoota, or anything else that by running, rolling, skipping, or hopping with us on its back gets us to our destination, and, incidentally, causes us pleasure, but it looks very much as if the scooter is going to be merely a weapon of amusement. That is to say, one can do on a push-cycle a great deal more than on a scooter; and if speed is required we must get a *real* motor cycle.

The powers that be warn us against luxuries, and it looks as if the scooter is going to prove one.

Good luck to the cycle and motor cycle makers, and to the scooter makers, too, if they can plant their product on the foreigner, but it looks very much as if the scooter is just one more damfool luxury—and those of us who are not grocers or munition makers are not buying luxuries now.

Because the Americans started scooters, must we? They have a President Wilson, a Meat Trust, and "dry" legislation, too. Do we want them? I *don't* think. T.H.C.

Inston.

The above snapshot was sent by the owner of a 4 h.p. Sunbeam, who recently toured North Wales carrying the camp kit on the carrier of the machine.

Sir,—In *The Motor Cycle* of June 26th there is a printer's error in my letter describing the home-made scooter. The average speed is quoted at 5 m.p.h., and should have read 15 m.p.h. B. H. BAYLISS.

SIZE OF TWO-STROKE ENGINES.

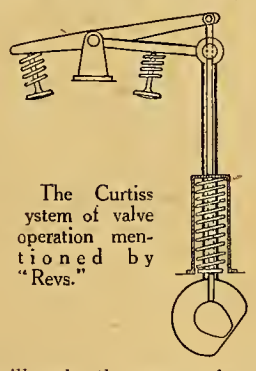
Sir,—Having ridden a number of two-stroke motor cycles, with engines ranging from 211 c.c. up to 339 c.c., I have come to the conclusion that anything under 339 c.c. is somewhat under-powered for fast and hard riding. I have ridden three different machines fitted with Villiers engines, all of which gave great satisfaction considering their size. Now, what I am waiting for is a Villiers engine of 2¾ h.p., about 350 c.c., fitted with a detachable head and also a phosphor-bronze bush in the small end. I should welcome the opinions of other riders regarding two-stroke engines of this size, as I think they are ideal for long distance work.

Now, just a word regarding gears to suit such an engine. I consider a two-speed countershaft clutch and kick starter is required, geared 4½ to 1 and 7½ to 1; present-day machines are geared much too low. With a gear of 4½ to 1 you could get a good speed without having to use full throttle, and, having an engine of fair power, you could climb some really bad hills on top gear, and, if for some reason you have to use low gear, you are not running your engine to bits as when you are using a low gear of 10 to 1. I consider a kick starter is required because plenty of riders, having done their bit in the war, are no longer able to run and jump on. My ideal lightweight is a 2¾ h.p. two-stroke engine with chain-cum-belt drive, and fitted with a tank that holds one and half gallons of petrol and half a gallon of oil. I might add that I have no connection with the Villiers Company. SPEEDY TWO-STROKE.

Sheffield.

VALVE OPERATION.

Sir,—Your correspondent, Mr. R. G. R. Pritchard, is thinking, I presume, of the Beardmore system of valve operation in his letter. The Curtiss system, which he mentions, employs two cams, two tappet rods and two valve rockers, but the system is interesting, as it is, as far as I know, unique in having two distinct springs for each inlet valve, the usual spiral spring of medium strength on the valve stem itself and another stronger spring on the pull rod, which, when the valve is required to open, is allowed to come into play by the *negative* inlet cam. In other words, the inlet valve opens when the *flat* side of the cam face meets the pull rod, which is forced down by the stronger of the two springs. The exhaust valve is opened in the usual manner by a comparatively small section push rod running up inside the inlet pull rod. I hope the sketch will make the system clear. In practice it worked most satisfactorily, especially as far as silence was concerned. REVS.



The Curtiss system of valve operation mentioned by "Revs."

PILLION RIDING.

Sir,—I was grieved, nay! disgusted, to read that the chief men of a township in the West of England had gathered themselves together into an inner room, and had there decided to send a petition to Parliament begging them to put a ban on the practice of carrying passengers on the carriers of motor cycles.

I sincerely hope that the men and women of England have not become so decadent that they are unable to take care of themselves. I have yet to hear of the motor cyclist who has compelled a passenger (whether male or female) to ride on his carrier. Since men and women do this of their own free will, surely it is not necessary for a law to be passed to interfere with this pleasant mode of locomotion merely because a few old men (who probably do not know the difference between an Auto-wheel and a motor cycle) think it dangerous. Many years ago, when I was at school, I frequently had it drummed into me that England was a free country. I now think I was being imposed upon. I will not discuss the case of the sportsman on a 3½ h.p. sporting single. That speaks for itself. Let us, however, think for a moment of the family man. Owing to the expense and discomfort of travelling in trains in these palmy days of "reconstruction," many men have taken their families for their summer holidays by means of a motor cycle. His wife and one child sit in the sidecar, while the second child sits on the carrier.

Wherefore I feel it my duty to request you to summon a meeting of sporting motor cyclists (of the super class), and to bear down upon this offending city from north, south, east, and west, and to seize the chief men of that city, and, before they have time to twirl their moustachios, to plant them firmly on the carrier and take them for a jaunt into the country. This, undoubtedly, would be a case of kill or cure. If, as they assert, it is a dangerous practice, they will be killed before they return, but if, as I think (and there are many who will agree with me), it is a safe and pleasant means of conveyance, they will be over-joyed and cured of their idiotic fancies. In the meantime, let us hope that there are enough sportsmen in Parliament to quash this ridiculous petition. BELLEROPHON.

Chobham.

GEAR RATIOS IN TRIALS.

Sir,—I am flattered that a rider of the calibre of your inimitable "Ixion" has not considered my suggestions regarding the A.C.U. Six Days' Trials beneath his notice.

May I trespass on your space and briefly deal with "Ixion's" well-meant criticisms?

I contend that it is an open question as to whether two trials would not be preferable to one, and I think the early future will decide this point.

As regards the vital question of "finishing condition," I considered that it was unnecessary to mention this, as I believe "finishing condition" already figures largely in the competition.

The chief point, however, is the condemnation of my suggestion that a low gear limit should be fixed. I cannot quite follow "Ixion's" chain of reasoning! He condemns very low gears, such as 18 to 1, as absurdities! He prophesies tree-climbing on gears of 30 to 1, and yet does not see that a minimum low gear ratio would put a stop to all this trouble.

I entirely agree when he says that the public need nothing better than an ascent of a hill like Sutton Bank at 20 m.p.h. on the last day of the trial, but I should not like to do this on an 18 to 1 gear.

My letter was purely from a rider's point of view. I contend that for a non-standard machine to gain a "gold" in a trial is no guarantee that the standard machine could do the same.

Nine out of ten riders never enter a competition, and they want a trial of standard machines. Then they know where to get their new mounts!

The remark that should my suggestion of minimum low gear ratios be adopted in any trial, the entire entry would be at the mercy of incompetent committees, is hardly relevant. I referred only to the A.C.U. Six Days' Trials. Surely the A.C.U. Committee cannot be regarded as incompetent!

I can say without hesitation, and with little fear of contradiction, that a strenuous trial for standard machines would do more for the pastime than a spectacular trial on freak machines. C. J. LEATHERBARROW.

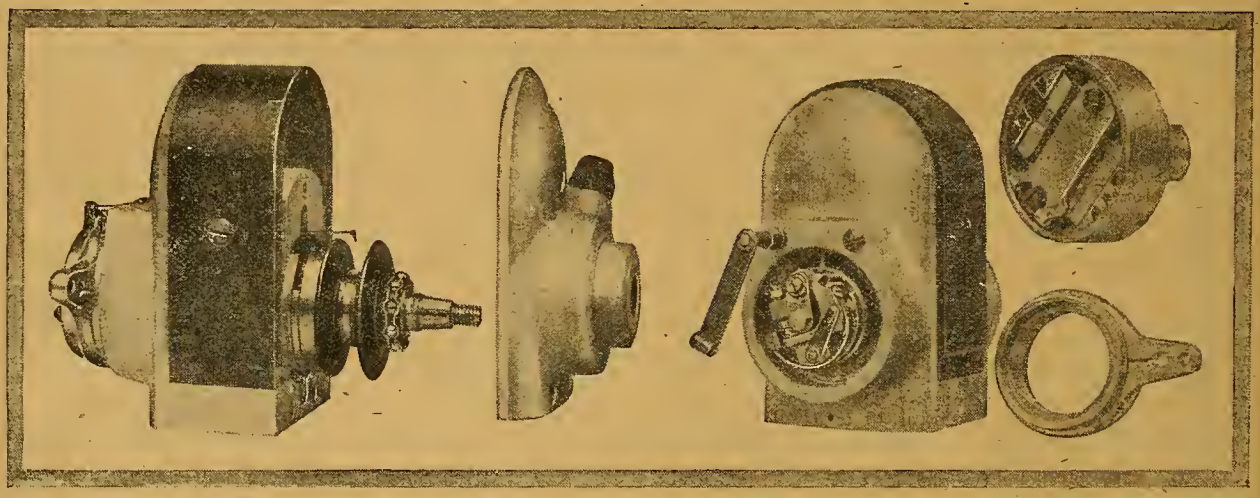
THE M-L MOTOR CYCLE MAGNETO.

A Successful Exponent of a Great British Industry.



The M-L magneto as constructed for motor cycles, with driving end plate removed. Note the safety spark gap terminal projecting over the slip ring, the aluminium extension forming the top of the armature tunnel and the unusual depth of the slip ring insulation. In the second illustration the cam ring is removed to show the design of the cam, which is formed by making an indentation in the one-piece ring of metal. The small upper photograph shows the condenser of the M-L magneto in its casing—the end plate of the armature.

THE improvements which British manufacturers have originated and adopted during the war have been of considerable importance and effect in increasing the electrical efficiency and the reliability of this type of ignition apparatus.

Among the firms which have during the war taken part in establishing a great British industry and in assisting towards the final victory of the Allies, by producing magnetos in immense quantities for aeroplanes and other war purposes, is the M-L Magneto Syndicate, Ltd., Coventry.

The improvements which have been embodied in the M-L machines during the war are included, so far as they are applicable, in the new K type machine for motor cycles. This machine is made for one, two, and V cylinder engines, the accompanying illustrations showing the single-cylinder type. Its smooth exterior will appeal to the user, for this feature should render cleaning a far simpler process than of yore.

Aluminium enters very largely into its construction, for the body consists of two castings of that alloy. The main piece forms the base plate, the contact breaker end, and an extension of the latter which serves to enclose the armature. The driving end plate is the other unit, and this encloses the slip ring and supports the armature at that end in a ball bearing.

The slip ring is notable for the depth of its flanges, which have been increased in diameter so as to prevent the current shorting to earth at this point.

The Condenser.

Two of the most important improvements consist of laminated pole pieces—in place of cast iron shoes—and the M-L patent condenser, which, incidentally, has been used with unqualified success in something like 20,000 aeroplane engine magnetos turned out by this firm.

The advantage of laminated pole shoes is that the eddy currents are considerably reduced, and this has the effect of increasing the electrical efficiency. As a result, a smaller and lighter machine as a whole will give a better spark than the pre-war German machine. The new M-L magneto will, it is claimed, give an intense ignition spark at armature speeds as low as 50 r.p.m., as compared with 100 r.p.m. with solid pole shoes.

The condenser, as designed by Bosch, and adopted almost generally by magneto manufacturers the world over, has been the cause of more magneto failures than probably any other part, but the weaknesses of the Bosch system have been eliminated in the M-L condenser, which does not, like the original, depend upon a packing of flexible insulating material to retain it in position and insulate it as a whole from its metal casing. It consists of alternate layers of tinfoil and mica, and while this is also the case in other condensers, the method of construction differs entirely.

Improved Insulation.

Square pieces of mica are used, some eighty in all, but each successive strip of tinfoil is laid at right angles to the preceding one, the strips being of such length that the ends project beyond the mica squares. One pair of opposing ends is secured in metal clips, while the other pair is pressed into a metal carrier. When the magneto is assembled in its casing the clips are in metallic contact with it, but the carrier is insulated by two simple washers of special material.

The whole unit is a thoroughly mechanical proposition, and the risk of bad insulation due to error in assembly is eliminated. In the contact breaker are several special points, one being the fact that the cam is ground to a carefully calculated profile on the interior surface of a continuous ring of metal; thus, there is no fear of the cam becoming loose. Its outline is such as to prevent that violent outward flinging of the rocker arm which results in the hammering of the points, and has been known to cause the breaking of the arm itself. The machine can be run at speeds from 4,000 to 5,000 r.p.m. for long periods without appreciable wear of the platinum points.

The rocking lever is supported in a bush of insulating material which is unaffected by water or a damp atmosphere, so that the trouble which motor cyclists have only too often experienced with magnetos will not occur with this machine. We refer to the sticking of the arm owing to a swollen bush.

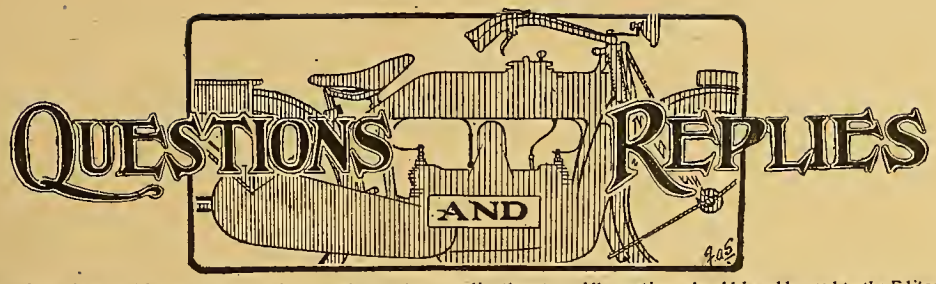
Absolutely Waterproof.

The contact breaker lever is secured to the cam ring in such a manner as to be adjustable to suit the coupling rods and levers, while an anchorage and screw for a Bowden control are provided.

The machine as a whole is made waterproof without the use of felt packing and without depending upon the fit of the magnet.

The high-tension terminal is an ebonite moulding screwing down on to a conical watertight seating in the end cover. In the socket of the moulding is an outwardly projecting threaded pin, on to which the high-tension cable can be screwed, during which process the rubber insulation is expanded within the socket, thus forming a watertight and secure fixing.

One other detail may be mentioned, and that is the safety spark gap, which consists of a bronze spring secured to the aluminium body and bent over the slip ring at right angles. When the end cover is assembled this spring is pressed down by the bore of the end cover itself, so that the correct gap between the tip of the spring and the slip ring is assured. When the end cover is removed the spring stands up clear of the slip ring flanges, and the armature can be readily removed.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

About Sparking Plugs.

(1.) Is an Aero sparking plug suitable for a motor cycle? (2.) Would the presence of oil on a sparking plug be sufficient cause for it not sparking?—A.H.B.

(1.) Yes, most Aero plugs are suitable for motor cycles. (2.) Certainly an excess of oil will prevent the plug from sparking.

Slow Running.

I would be glad if you could let me know the cause of the trouble with my 8 h.p. J.A.P. If I go slower than 15 m.p.h. the engine starts jerking. Some hills it takes on top, but going over the same hill again I have to drop into low. I may say I have an adjustable jet. I cannot shut it off any more or else the engine stops It does about 40 m.p.g.—A.G.W.

The cause of your trouble is rather obscure, but it would seem that either the magneto timing is too far retarded or the valve timing is wrong. Either of these would account for a high petrol consumption. The spark should occur in the rear cylinder, when the piston is about $\frac{1}{16}$in. down the firing stroke with the spark lever fully retarded.

Unsatisfactory Running.

I have a 2¾ h.p. Douglas which is not working properly, and I should be glad if you could suggest what is wrong, and tell me how it may be remedied. The machine is not a new one, and I do not know the date—I think probably 1912 or 1913. It seems in very good condition except that the rear cylinder does not work. The sparking plug is in order, and the valve caps are screwed down tightly. I think there is loss of compression, but cannot find just where. In starting (in which there is no difficulty) only the front cylinder works, but when some speed is attained the rear one begins to work. When climbing, however, the rear cylinder ceases to fire, and I cannot reach the top of a moderately steep hill. It seems that when the machine is moving at a considerable speed the cylinder works before the mixture has time to escape, whereas when the machine is moving slowly the mixture escapes before it has time to work the piston.—F.A.R.

You had better look at the carbon brush leading to the rear cylinder plug. Remove it, see that it is working freely and properly connected to the h.t. cable. Clean the magneto slip ring with a piece of clean rag moistened with petrol. See that your sparking plug gap is not too small, and that there are no air leaks at the rear cylinder induction pipe union. Examine your valve tappets, and note that the clearance when the engine is warm is equal to the thickness of the blue cover of *The Motor Cycle*.

Registration.

I owned a 2¾ h.p. two-stroke, which I bought from a firm in London in April of this year, and, so that I could ride the machine home, I paid 10s. for numbers to the firm. I have since sold the machine and have bought another one. Am I entitled to use the numbers on this machine, or must I get others?—F.P.

The machine you have bought must be registered, unless it is already registered, when, if the number has not been cancelled, it may be transferred to your name for the sum of 1s. Your present numbers cannot be used.

Magneto Mystery.

I have a Bosch magneto fitted to the engine of a cycle car which either refuses to spark altogether or only occasionally gives a poor spark. When the magneto is taken off the engine it sparks perfectly, but directly it is fitted on and the crankshaft turned it acts as stated above. It has been thoroughly overhauled twice by an expert firm, but no defect can be traced. It occurred to me that it might be caused by a defective high-tension return (viz., *via* the cylinder crank case, bracket, etc.), and suggested taking a lead (high-tension) direct from the body of the plug back to the base of the magneto; but I understand this has been tried and failed.—E.T.P.

The solution to your problem is very difficult to determine without actually examining the magneto, etc. Apparently, the magneto itself is in quite good order, but does not spark when in position on the machine. Two things may cause this. One, as you suggest, a break in the circuit, or else a short. The attaching screws are not likely to be so long as to come in contact with the armature, so that the other point is the armature spindle. There may be a leak between the collector ring and the spindle through the vulcanite ring, or the wire from the secondary winding to the collector ring may be shorting. See that there is no foreign matter in the armature tunnel and none of the wires exposed. Farther than this, we can only advise you to submit the magneto to a magneto expert.

Does not take Top Gear.

I have a new P. and M. After I have changed from low gear into top, the engine jolts for a certain distance. Would you kindly suggest any reason for this? I have had the carburetter down, and cleaned it.—G.H.

Probably you change up too soon; allow the machine to acquire a fair speed first. Also, you would find the engine would run more smoothly if you retarded the spark until the requisite speed has been attained.

An Auxiliary Exhaust Valve.

(1.) I have a 3½ h.p. Premier and there is an extra exhaust pipe leading from the cylinder direct, which is integral with what I presume is an extra air valve. What is the object of this? (2.) If I dispensed with this part, and made the hole in the cylinder a blank, would it affect the efficiency of the engine?—J.W.B.

(1.) The valve is the extra exhaust valve, designed to allow the exhaust gases to escape when the piston descends below the level of the valve port. (2.) No useful end would be attained by removing the valve. If you did remove it and left the hole bare you would lose a certain amount of oil, and the exhaust noise would be appreciably increased. By stopping up this orifice you might interfere with the efficiency of the engine slightly.

Starting a Two-stroke.

I have purchased a 2¾ h.p. T.D.C. two-stroke. It suits me spleudidly, but has the following drawback. It is a fixed engine, and as I have been wounded in the left knee I am unable to jump on from the left side, and I am not used to the right side. It starts easily enough with a run, but I was thinking that it may be possible to paddle it off. A free engine hub would solve the problem. I have tried the makers for one, but they have discontinued making. Is there anything in the way of a decompressor suitable for a two-stroke? The frame is too short for a gear box.—W.B.

We do not quite see why you require a clutch, as you should be able to start the machine quite easily by paddling off with the release valve open, dropping it when in motion. This is quite feasible if the machine is in good tune, and a clutch would only permit of your keeping the engine running while standing.

Using Benzole.

Last month I bought a new 1919 W.D. model Triumph, and, without altering the carburetter or fitting an extra air valve, ran it entirely on benzole. After 800 miles I took the engine down and decarbonised it, though this was found to be really unnecessary, because both cylinder and piston were not thickly coated with deposit. In France I broke in four new Triumphs on W.D. spirit, and on each occasion found that the over-oiling, when new, made decarbonisation absolutely necessary after the first 500 miles. Popular opinion states emphatically that benzole is dirty stuff, and soots up in no time. (1.) Is this a popular fallacy? (2.) If not, where is my experience misleading? I am running on Gargoyle T.T. oil.—D.M.W.

Yes; this is a popular fallacy. Given the correct mixture, benzole is just as satisfactory as petrol, though we prefer a mixture of the two spirits.

The Local Taxation Licence.

I am writing to ask for your valuable assistance. I had a 2¼ h.p. New Hudson two-stroke, which I registered at Norwich, and for which I have paid the £1 tax. In April last I decided to sell my 2¼ h.p. two-stroke and bought a 3½ h.p. New Hudson. I paid the 5s. fee and had the registered number transferred to the 3½ h.p. machine, and also changed my registered address from Thetford to London. Now the local taxation authorities in London have given me notice that I must take out a licence for the 3½ machine. Will you please inform me if I am liable for the £1 tax, or should the licence I took out for the 2¼ hold good for the 3½?—R.E.R.

This is quite incorrect. The same local taxation will do, provided, of course, it has not expired, and that you did not keep and use both machines at the same time.

Two-stroke Lubrication and Timing.

I have a Sun-Villiers two-stroke machine, and should be obliged if you would give me your opinion on the following points: (1.) Using the petroil system of lubricating the engine, what is the correct amount of oil to mix with a gallon of spirit? (2.) The machine runs satisfactorily up to 25 m.p.h. If I open out further it runs well for a mile or so, then ceases to fire, but picks up before stopping, then fires in bursts of a hundred yards or so, as though petrol supply were failing. This latter, however, is quite in order, my carburetter being an Amac in good condition. The jet is not choking. (3.) How should the magneto be timed to spark? This works satisfactorily, but as fully retarded, the spark occurs ⅛in. before top of stroke, it occurs to me that the timing may be a little out, though at 20 m.p.h. I can use full advance.—S.V., York.

(1.) Half a pint of oil to one gallon of petrol is the correct proportion. (2.) The trouble is due to pre-ignition, probably caused by the use of an unsuitable plug. This would account for the symptoms described. (3.) The magneto should be timed in the following way for variable ignition. Place the piston exactly on top of the compression stroke and connect up the magneto with the points just broken and the ignition lever fully retarded.

Leaky Accumulator.

I use a twelve-volt accumulator for lighting my motor cycle, but lately I have been troubled with the terminals of the cells breaking off, through the effects of corrosive green crystals forming over the terminals. Can you please tell me how to prevent this? What is the cause of these crystals forming on the terminals, as I have had this cell for nearly a year, and it is only lately that this has happened?—H.A.McQ.

The cell material must have cracked round the terminals, allowing the acid to creep on to the metal of the terminal studs. The remedy is to have new terminals fitted and the cell properly cemented up and made acid-tight.

Magneto Timing.

Would you kindly help me in the following matter? My Scott cycle, up to a month ago, ran evenly without mishap. I have just dismantled the gear box, and, on replacing in frame, I cannot get a single explosion from the engine. I have fitted new plugs, one of which gives a good spark, the other an intermittent one. Compression is good and carburetter floods freely. On turning the back wheel the result is nil. Is it the timing that is wrong? I have experimented with the wheel in different positions, but all to no purpose.—F.S.

You should certainly check the spark timing. The contact should be about to break when the piston is on top dead centre with the advance lever in midway position. Are you quite sure the weak sparking plug is sound?

Silencing a Two-stroke.

I want to silence down my 2½ h.p. two-stroke if possible. (1.) Will the fitting of baffle plates in the silencer be likely to cause any loss of engine efficiency? (2.) If not, how many plates would it be advisable to fit in each of the two silencers, and would thin aluminium sheet be suitable for the purpose? (3.) The machine is a new one and has now been ridden about 400 miles, and, until recently, has given no trouble, but after three or four miles now the crank case becomes very hot; that is, too hot to touch with the fingers. Can you tell me the probable cause and remedy? I have used plenty of oil of the brands recommended by the engine makers. (4.) About how many miles should such a machine run before decarbonising is necessary?—E.A.

(1.) Yes, you would undoubtedly get loss of efficiency and back pressure. The silencing of a two-stroke is a matter which has puzzled engineers for a long time, and no satisfactory solution has yet been found. (2.) Thin aluminium would not be suitable, as it would be liable to disintegrate under heat. (3.) The probable cause is the conduction of heat from the cylinder, but unless the engine loses power you need not worry about it. (4.) About 1,000 miles.

Removing Tar.

(1.) What is the best way to clean tar off the frame of a motor cycle? (2.) Is it in any way detrimental to the enamel to use paraffin for cleaning purposes?—J.G.

(1.) All you can do is to attack the tar with grease before it is dry. If it is left on to dry it will take the enamel off when an attempt is made to remove it. (2.) It is not detrimental to enamel to use paraffin for cleaning purposes.

EXPERIENCE WANTED.

"G.F." (Rotherham).—4¼ h.p. Norton. Reliability, tyre wear, and m.p.g. for both petrol and oil when ridden solo.

"L.P." (Catterick).—Grado gear fitted to a 1912 Triumph.

RECOMMENDED ROUTES.

Derby to Rhyl.—G.A.C.
Derby, Ashbourne, Leek, Congleton, Middlewich, Over, Kelsall, Chester, Mold, St. Asaph, Rhuddlan, Rhyl.

Rhyl to Blackpool.—G.A.C.
Rhyl, Rhuddlan, St. Asaph, Mold, Chester, Warrington, Newton-le-Willows, Wigan, Preston, Kirkham, Blackpool.

Blackpool to Derby.—G.A.C.
Blackpool, Preston, Wigan, Warrington, then through Knutsford, Holmes Chapel, Congleton, Leek, Ashbourne, Derby.

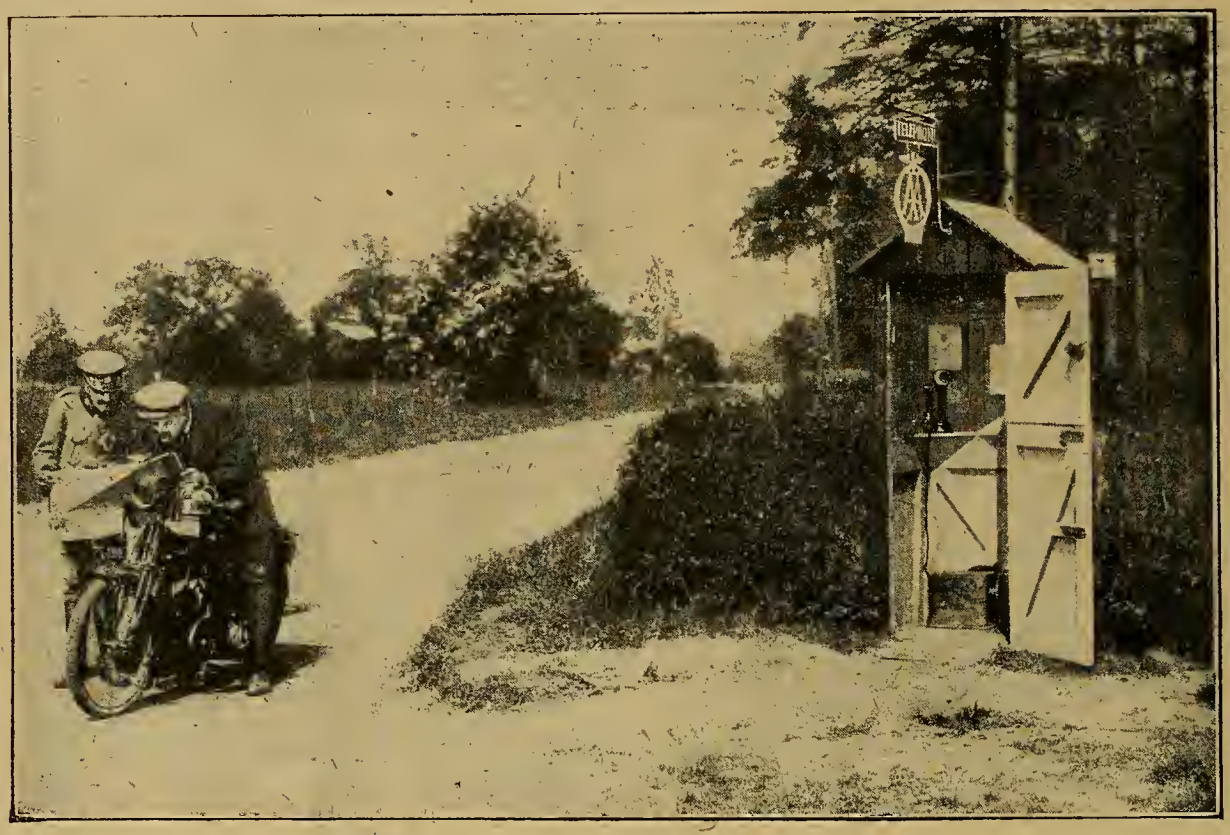
Budleigh Salterton to Betchworth.—R.W.B.
Budleigh Salterton, Colyford, Lyme Regis, Charmouth, Bridport, Dorchester, Wimborne, Ringwood, Cadnam, Romsey, Winchester, Alresford, Alton, Farnham, Guildford, Gomshall, Dorking, Betchworth.

Bedford to Margate.—F.E.H.
Bedford, Shefford, Henlow, Baldock, Buntingford, Bishop Stortford, Harlow, High Ongar, Brentwood, East Horndon, Tilbury, by ferry to Gravesend, Rochester, Chatham, Sittingbourne, Sarre, Margate.

London to Helston.—H.A.C.
London, Kingston, Esher, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, Alresford, Winchester, Romsey, Cadnam, Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis, Charmouth, Colyford, Exeter, Okehampton, Launceston, Bodmin, Goss Moor, Ladock, Truro, Perranwell, Polgreen, Helston.

Glasgow to Northampton.—P.S.McK.
Glasgow, Hamilton, Lesmahagow, Abington, Beattock, Lockerbie, Ecclefechan, Gretna Green, Longtown, Brampton, Alston, Middleton-in-Teesdale, Barnard Castle, Scotch Corner, Leeming Lane, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Stamford, Kettering, Northampton. Approximately 330 miles.

WORTH WAITING FOR.



THE BADGE.

WHAT IT MEANS AND SECURES TO MOTOR CYCLISTS.

The A.A. badge was originally adopted by the Automobile Association as an additional protection against malicious police persecution, and was the first symbol of its kind carried by motorists.

Since its adoption the Association has continuously widened its scope of activities, and every member—car, light car, or motor cycle—now enjoys the following privileges:—

Free Service of the A.A. Patrols, who will be found on nearly every main road in England, and render assistance to members in case of breakdown; obtain petrol, tyres, or other replacements; render first aid; give warning of roads under repair; indicate alternate routes, and are always at the service of members.

Roadside Telephones, which are installed in patrols' sentry boxes all over the country and can be used for all purposes, including messages to home or office, to hotels for accommodation or meals, and to garages for replacements or assistance.

"First Aid" Motor Cycles, driven by expert mechanics who, in the event of a breakdown, render assistance to enable members to continue their journeys.

Free Legal Advice on any matter connected with motoring.

Free Legal Defence in any police court in the United Kingdom to answer charges under the Motor Car Act.

Free Touring Information, including specially prepared routes for business or holiday tours, showing the best roads to any part of the United Kingdom.

Free Touring Assistance to members going abroad with car or cycle, including crating and shipping of vehicle, the supply of routes, necessary triptyques, and other documents.

Other privileges include Engineering Assistance, Special Insurance Facilities, Officially Appointed Agents and Repairers, A.A. Hotels, etc., etc.

Full particulars of the benefits which the Automobile Association extends to its members are contained in the booklet, "The Key to the Open Road," a copy of which can be obtained, post free, from the Secretary, A.A. & M.U., 21, Fanum House, Whitcomb Street, London, W.C.2. Send a postcard to-day. Motor cyclists in London who wish to join the Association without delay are invited to call at Headquarters, where a staff of experts is always in attendance ready to give information on any question relating to Motoring.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., & Co. and crossed. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but if not we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10 the fee is 1s. All deposit matters are dealt with at 20, Tudor St., London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles.

MONEY well spent

Here is further unsolicited proof of how we satisfy our clients—just a few extracts taken at random from the many testimonials we have recently received:—

"I must take this opportunity of informing you how well satisfied I am with the machine, as I have done over 2,700 miles without five minutes' engine trouble, which I think is a credit to you, and shows the very efficient manner in which you look after your customers."

"The machine ran very nicely, and did not give the slightest trouble. Thanking you for the straightforward business-like way in which you treated me."

"Just a line to say that the 3½ h.p. Motor Cycle I bought off you second-hand is running well in every respect. I am perfectly satisfied with it, also the straightforward way in which you treated me. Have found every word of yours correct concerning the machine, as I have given it a fair run before writing you."

"... all the same, your word is sufficient as to the machine's worth—the reputation of Layton's for fair dealing extends beyond Bicester."

"Let me take this opportunity of thanking you for the business-like and courteous way in which you have dealt with me."

"Again thanking you for your straightforward dealing."

And if YOU too would guarantee a thoroughly satisfactory purchase and a service personal, courteous and reliable, then get in touch with us NOW.

We invite enquiries *re* A.B.C., Ariel, Blackburne, Enfield, Ivy, New Imperial, Norton, Sparkbrook, and Triumph Motor Cycles, and Hillman, Standard, Singer, and Dawson Light Cars.

Finding a Winner.

NOW that club secretaries and others up and down the country are giving their attention to the problem of finding a winner in reliability trials, it should not be long before a satisfactory solution is discovered, though, as one of our contributors justly points out, it is an open question whether a single valuable award should be made in a reliability trial where so little separates the first few competitors. Of course, we get the same kind of thing in other sports; for instance, the winner of the King's Prize at Bisley gets £250, a gold medal, and a gold badge, while the second man, who may be only one point behind, that is about ⅓%, gets £60 only. In a case like this, however, it is possible to say definitely that one man's score is better than the other's, but, in a reliability trial, it is very difficult to decide which of a dozen or more performances is the most meritorious.

A fast and slow test on a hill or level ground can be used, but it is obvious that in this case the figure of merit should not be obtained by dividing the fast time into the slow, as was done at the Midland C. and A.C. trial recently. This, as was pointed out in our correspondence columns, gives the same figure to performances of very different merit. Subtracting the fast time from the slow is open to the same objection, and while encouraging the embodiment of four-speed gear boxes with a very low emergency gear, which is a feature advocated by many riders, it also tempts a manufacturer to fit a non-standard gear box in his competition machines. As a matter of fact, the winner of the premier award in the trial mentioned above had four speeds on a machine normally having two. We think entries in such trials should be confined to machines conforming to the makers' catalogue specification, or, in the case of experimental models, the public should be advised that such machines are not to standard specification. We suggest, as a simple means of obtaining a very satisfactory result, that double the slow speed should be subtracted from the fast speed. The formula would then be F—2S (F being the fast speed and S the slow).

Another method was used in the Arbuthnot Trophy. This was a test of consistency, not of flexibility, and it had much to recommend it, but the latter might be allowed to count in the event of the tie in the former, *e.g.*, a competitor whose speeds are 5 and 20 m.p.h. on each trial should be adjudged superior to one who was able only to do 8 and 16 m.p.h.

The brake test, to be used in the Midland Cup Trial (*vide* our "Correspondence" columns), has also much to recommend it. The conditions are simple and effective. But we do not think that this test should be used as a means of finding a winner, except in the case of a tie on all other points.

The Weight Factor.

SINCE events like the Six Days Trials have become rather an item of manufacturers' propaganda than mere sporting contests, we think that greater insistence should be placed upon the comparative weights of the competing machines, especially as regards sidecars, and that this question, in common with "finishing condition," should be made to bear upon the allocation of awards.

Thus, if two machines of equal capacity and similar specification survive a modern trial without penalisation, surely the designer of the lighter one deserves the encouragement of the premier award in so far as he has evolved, by economy and choice of material and skilful planning, a design inherently strong rather than one dependent upon sheer weight of metal.

We strongly urge Mr. Loughborough to ascertain *(and make public)* the weight of each machine, complete with spares and equipment, entered in the forthcoming Six Days Trial; such publication, we feel sure, will form an interesting comparison with "catalogue weights."

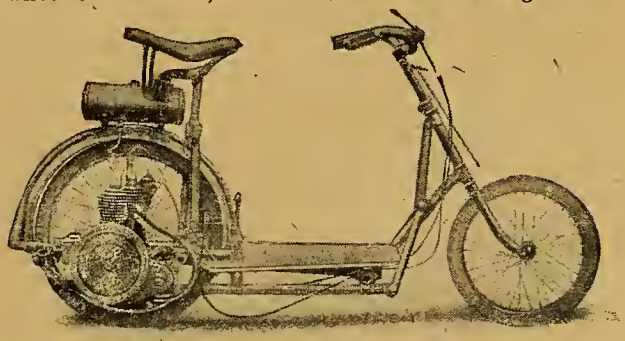
An index to the advertisements in this issue will be found on the page facing the back cover.

NEW SCOOTER DESIGNS.

Lightweight Motor Cycle Features embodied in the Latest Models.

THE L.A.D. SCOOTER.

WITH the main object of converting Auto-wheels into motor scooters, a new company, L.A.D. Scooters, has been formed, with works at Lower Bourne, Farnham. As will be seen from the illustration, the frame, which is registered, is of the open type with platform, and is fitted with a small wheel at the front, but in future models a larger size

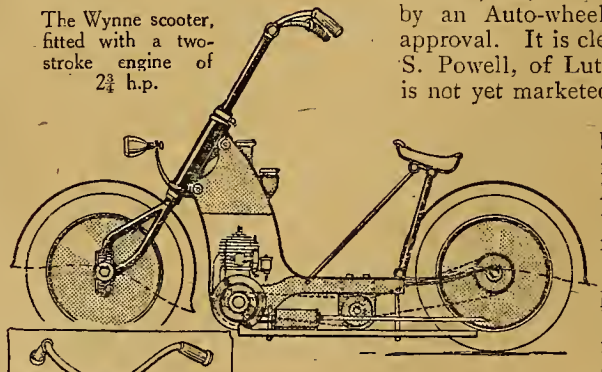


The L.A.D. scooter, embodying an Auto-wheel.

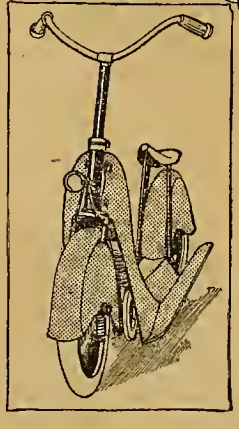
wheel will be fitted, probably of the same size as the rear Auto-wheel. The standard frame of the Auto-wheel appears to be used, but a rim brake is fitted to the wheel rim. The price for the complete scooter is £39. Fitted with a thoroughly overhauled second-hand Auto-wheel, the figure is £25. The company is prepared to build up customers' own Auto-wheels.

THE WYNNE SCOOTER.

The interest in scooters shows no signs of diminishing, and every day we hear of new propositions, designed, made, or projected. There is a decided tendency now for designers to embody a seat and so develop the machine into the miniature motor cycle as we have forecasted. The latest machine to be brought to our notice is the "Wynne" scooter, the design of Mr. J. W. Oates, Mona Terrace, Douglas, I.O.M., which appears to embody many desirable features.



The Wynne scooter, fitted with a two-stroke engine of 2¾ h.p.



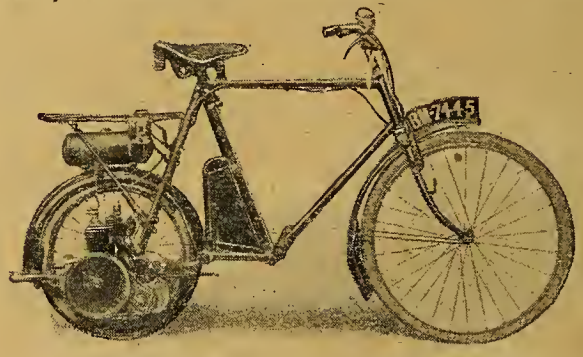
A light pressed steel frame carries a 2¾ h.p. two-stroke engine at its fore end which drives a countershaft clutch, by chain, at the rear, whence another chain transmits the drive to the rear wheel. The machine is sprung fore and aft, the forks by coil springs, the rear wheel by leaf springs; and both wheels are efficiently guarded by aluminium covers made in two halves to facilitate rem val.

Petrol and oil tanks are carried above the engine, and at the rear the frame supports long rubber-covered footboards, which are only a few inches from the ground. The whole is enclosed by a cover, which has convenient doors to give access to the engine, etc. 16 × 3in. disc wheels are fitted.

The gear ratio is 5¼ to 1; hence it approximates to a conventional two-stroke motor cycle in respect of power and speed, but weighs only 50 lb. It is the intention of the designer to embody a small dynamo for lighting front and rear lights, and the suggested price is £35.

A 50 lb. MOTOR CYCLE.

The designer of the machine depicted below evidently believes in the ultra-lightweight motor cycle, and



The 50 lb lightweight motor cycle in embryo.

does not deem either the "sit down" or the "stand up" type of scooter as covering his requirements. It is obvious, too, that the auxiliary power as supplied by an Auto-wheel did not exactly meet his approval. It is clear that this constructor—Mr. S. Powell, of Luton—wanted something which is not yet marketed; an ultra-lightweight motor cycle on which l.p.a. would be impossible, even if it were necessary. So he combined his pedal cycle with his Auto-wheel, and the result is by no means displeasing.

It will be seen that the pedalling gear of the cycle has been removed and a pair of footrests substituted, and the conventional back wheel was jettisoned in favour of the complete Auto-wheel unit, with the rear brake made to operate on the flywheel.

We are informed that the machine is quite roadworthy, and capable of 25 m.p.h. under normal conditions.

ESSEX M.C. SPEED TRIALS.

In addition to the classes already announced to compete at Southend on the 23rd inst., it has been decided to include events for any standard touring motor cycle under 250 c.c. and for motor scooters of any engine capacity.

Occasional Comments by "Ixion"

The Cautious Buyer.

I HAVE received a number of letters from would-be motor cyclists of the impecunious type. Transport necessities impel them violently towards purchase, but they are very "windy" about depreciation. As several of them shrewdly perceive, there are three special factors (if not four) which make depreciation rather a problem at the present moment, namely:

(1.) Machines made between 1913 and 1916 will cease to be worth from £50 to £75 as soon as the present famine terminates.

(2.) Machines turned out this year may depreciate at an unusual rate if Olympia produces a bevy of sensational new models.

(3.) Prices may come down with a run in the course of a year or two, if industry and finance settle down.

(4.) With so many new firms and production on a larger scale, an excessive number of machines may be manufactured during 1920-1921, and the less popular makes may ultimately be dumped on the market at a cut price, and pull down all second-hand values.

Consequently, people who command just sufficient capital to buy a machine and do not wish to drop too much when they sell are a little worried.

Some Possibilities.

IT is, of course, certain that machines constructed between 1913 and 1916 will depreciate very heavily next year. No sane man will buy such mounts at the fancy figures usually demanded nowadays unless he can afford a real loss, and faces this certainty in his eagerness to get on the road at once. A friend of mine has just disposed of a 1913 machine for £6 more than it originally cost him: it is as near as no matter worn out, and was something of a dud when it was new; its purchaser will drop at least fifty per cent. if he resells next spring, nor does he expect any happier fate. So far as the second factor in my last paragraph is concerned, I do not believe that second-hand prices will suffer by reason of revolutions in design. Manufacturers are very slow to injure their old clients by introducing sensational new models, which throw all previous patterns out of date and cause a slump in their market value. Moreover, the "newsters" have yet to beat the "oldsters." On the whole I see no reason why a genuine 1919 model should depreciate more heavily in 1920 than a 1911 model did in 1912.

Over-production?

FROM an amateur's standpoint a year of over-production would be a glorious lark. Over-production means cut-throat competition by the traders concerned. Once upon a time there was serious over-production by the steamer companies who convey tourists to the Isle of Man; and the rate-cutting grew so fast and furious that towards the finish one company took you over for nothing and gave you a fizz lunch on board, whilst the other—mindful of choppy seas and queasy tummies—took you over for nothing, and gave you a fizz lunch *the day after your arrival* (or words to that effect). If such a situation ever developed in the motor cycle trade, we might get brand new 6 h.p. sidecar outfits for £10, plus a free insurance policy and a ticket in a draw for a year's petrol. But it won't. The slogan, "Our works are organised for mass production at the rate of 100 machines per day," is not pure hot air; the stated quantity could be produced, and would be produced if the agents' orders at Olympia indicated that 30,000 machines could be disposed of. But every sales manager can estimate his year's output to a nicety when Olympia closes. If his machine is quite superbly good, or wins the T.T., he may be a few hundreds out, but not more. The trade is not so silly as some owners imagine. If it makes 250,000 machines during 1920, it will be assured a very rosy prospect of placing every one of them. So we shall not see makers dumping hundreds or thousands of machines on the market at cost price or at a very heavy loss; and we need not fear that second-hand prices will be cut to slivers by such a catastrophe.

No Depreciation Till You Sell.

THE timorous ones need reminding that there is a difference between mechanical depreciation and pecuniary depreciation. Mechanical depreciation is like a temperature graph—it undulates. The line goes up as you run the machine in; down again as the valves pit and carbon crusts form; up again when you decarbonise; down again as the bushes begin to go; but it need show no permanent mechanical depreciation in ten years. And if a machine is bought for use, it is running depreciation which matters; given proper maintenance, this type of depreciation may be ignored. On the other hand, pecuniary depreciation is remorseless and inevitable, being based on the passage of time. But it is like a tooth: it is bound to bother you some day, but you need not worry till it starts. Thus, if I buy a £100 machine *for prolonged use*, its money depreciation does not worry me. I intend to keep it ten years. If I have to give it to the dustman at the end of the tenth year, depreciation has cost me £10 per year, or just under 4s. a week. Why wear myself to fiddle strings at the thought that in its third year it may only be worth £40, when I have no intention of selling it till it is ten years old?

The Wisest Plan.

I AM tackling this topic at some length because I cherish a considerable sympathy for that silent army of riders who never enter a competition, and have to put off their weddings for two years if they buy a machine. They must buy to keep, for every resale implies a loss, unless one is prepared to prey upon fools. They must buy a real good machine, for the duds will not last ten years. They must buy from a firm which has a reputation for stocking obsolete spares. If the sport is tackled on these lines, the financial aspects admit a pretty close reckoning.

IMPRESSIONS AT THE ARBUTHNOT TROPHY TRIAL

Is the 20 m.p.h. Average Too Low? The Navy revises its Opinion.

By B. H. DAVIES.

IN "The Green Curve" Ole Luk Oie tells how the issue of a battle turned on a general's knowledge of the mind of his opponent. I do not doubt that the lieutenants who contested the Arbuthnot Trophy were up to all the wiles of Jerry, and could deduce volumes from the cock of a periscope. The trouble was that on the morning of the first day they failed to realise that Von Hipper and Von Scheer were babies compared to Secretary Loughborough, and that the modern reliability trial is founded on the strategic principles of Clausewitz. Thus, at the start, some of them complained bitterly that they were strictly limited to a schedule of 20 m.p.h. maximum. They informed sundry armletted officials that in naval motor-cycling circles legal limit riding simply is not done. Mr. Loughborough spread a pair of grimy and deprecating palms, and spoke vaguely of the law.

Slaughter of the Innocents.

Fuming but helpless, the "sporty boys," as W. H. Berry would term them, fidgeted along at twenty for an hour and a half along main roads. By this time Loughborough had accomplished his fiendish purpose. He had hoodwinked the innocents into fancying that a reliability trial was a tea party. So he now proceeded to switch them down an innocuous-looking little turn near Huccaby, and for the next 150 minutes all the riders were risking their necks in order to keep inside maximum time; and maximum time spelt no higher average than a measly 18 m.p.h. Even at this some of them were slow in tumbling to the situation. After a prolonged spasm of goat tracks, cat-crawls, chicken ladders, moor gates, river beds, and greasy aisles beneath arching trees, they emerged into lanes—well, quite 8ft. broad, with occasional straights of—well, quite sixty yards at a time.

Quoth the greenhorns to themselves, the arch-devil who planned this sporting course must have just about exhausted his supply of freak hills; presently I shall emerge into lovely main roads, when I will blind some, and catch up the twenty minutes I have dropped on schedule time. But the relentless minutes passed, and still the arrows led on down twisty lanes, and around blind corners, obsessed with carts of hay and eke of timber, with army corps of frisky lambs, and giant stallions and nervous bullocks. Finally, real anxiety was begotten, caution was thrown to the winds, and alarmed competitors commenced the usual A.C.U. T.T. stunt, with frenzied accelerations down every trumpery straight of a hundred yards, and crashing on of brakes at the next corner. Then Secretary Loughborough produced the ace and king of trumps, in the form of tempting straights leading up to unostentatious arrows which hauled us back round V corners to face vertical ascents loosely covered with metal, road, assorted, unrolled, samples. By lunch time the entire entry had conceived profound suspicions of the man Loughborough. All of them knew what the seasoned competition rider learnt under the same astute tuition years ago. Which precious knowledge may be summed up somewhat as follows:

1. Do 30 m.p.h. average while you can: roads are coming where no man may exceed 12 m.p.h. and live.
2. Blessed is the man who can drop from 50 m.p.h. to 3 m.p.h. in eight yards.
3. A quick gear change, yea from top to bottom, secureth a gold medal: but he of clumsy hands must be content with a parchment certificate.

Impressions of the Arbuthnot Trophy.—

4. The valley roads are pleasant; but their sides are fringed with fearsome precipices; and thither the next arrow will assuredly point.

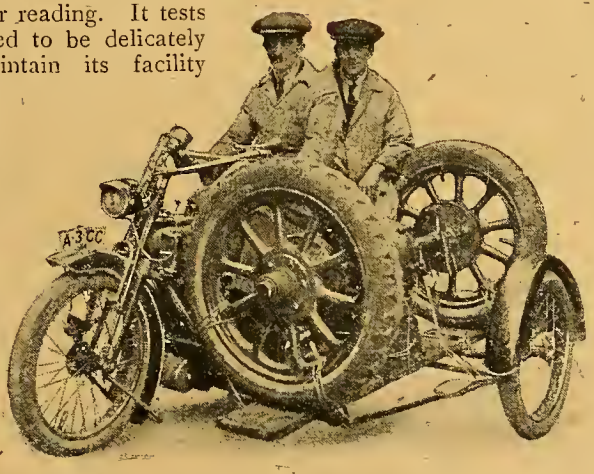
5. Good going never lasts in an A.C.U. trial.

6. Despise not the short straight; along it thou canst save seconds which may hereafter be precious.

7. But bear in mind that the next corner turneth back upon itself; and around it lurketh danger.

The Consistent Driving Test.

Secretary Loughborough received many congratulations on his patent method of finding a winner. As already reported, it consisted of setting a man to climb part of a hill on the first day at, say, 10 m.p.h., and another part of the same hill at, say, 15 m.p.h. and repeating the two stunts on the same hill during the following day; the non-stopper whose first and second day performances were most consistent was to lift the cup. This is a good system. It tests the rider, for he must be dexterous to climb to an exact speedometer reading. It tests the machine, for it is required to be delicately controllable, and must maintain its facility throughout the trial. Furthermore, the dodge throws the minimum of bother on the officials, and occasions the least possible delay in running off the event. It is obviously a long way ahead of secret checks and split-second timing, whilst it does not spoil the ride for the competitors, nor entail delay and organisation which a long series of driving tests demand. It is doubtful whether anything better can be devised. On the other hand, it need not damp secretaries who are still exercising their brains. In ordinary riding, no man attempts slow climbs to a set speedometer speed any more than a golfer takes his brassey on the greens. Moreover, the difference between the winner of the trophy and the best gold medal may not be more than one second. This is grossly unfair. I question whether the justification of valuable single awards to individual riders in reliability trials can be maintained nowadays.



A Chater-Lea sidecar combination with the body removed, being used to carry a back axle of a motor lorry. The weight is about 7 cwt., and shows again the utilitarian value of the motor cycle.

The Value of Test Hills.

Incidentally, the trial threw into high relief the climbing powers of the modern machine. So far as gradients of good surface were concerned, the 3½ h.p. models usually stormed up fast on second gear. One rider on a four-speeder never required more than one-third throttle on his second gear, whilst one of the official sidecar outfits (a Matchless) was almost equally oblivious of its bottom ratio. It does not follow that hours of freak hill-climbing have ceased to serve any useful purpose. They test everything about the machine. Bad lubrication systems tend to oil up plugs during long descents. The rough going, inseparable from freak hills, shakes loose any part which is not properly fitted. The high engine revs. form a substitute for extra mileage, which considerations of time would otherwise exclude. Moreover, as this trial, contested so largely by comparatively inexperienced riders, sufficiently demonstrated, freak hills test the rider.

There was not much really bad going in the event. The two gems were the rough hairpins at the bottom of Brook Hill and just over Denham Bridge. In each case a sharpish corner of stiff gradient was carpeted with soft loam and rough stone. Speed was impossible, and the best machine takes some handling when its back wheel is alternately spinning in soft mud or kicking and plunging on a miniature moraine. A tiny watersplash at the foot of Brook Hill proved rather severe on belts. For this reason watersplashes should figure in non-stop sections on all important reliability trials. If the belt is to survive, it must be developed to hold its own under all conditions where a chain gives no trouble.

In one respect the trial was especially interesting. It was run from beginning to end on the non-stop principle. The officers and gentlemen who formed the competitors were trusted to report their own stoppages on signed cards. Last week's report showed how completely the absolute non-stop eliminates most of the entry, even in 250 miles; on the other hand, it must be remembered that a more experienced entry, including the usual percentage of trade experts, would have suffered far fewer stops.

The Object of Trials.

Regarded as an exercise canter for the A.C.U. Six Days at Llandrindod Wells next September, the trial must have given the Competitions Committee plenty to think about. The main function of an A.C.U. trial in these days is not to advertise the sport, as once it was: the sport no longer requires advertisement. Nor is its function to distinguish between good and bad riders: broadly speaking, the British public is not interested to know that Jack Smith can scrabble up six stony hairpins, whereas Georgie Brown comes a cropper on three of them. *The Six Days are expected to classify different types of machine in order of merit*, it being taken for granted that all the riders reach a certain standard of ability. It will be very difficult to safeguard this function in 1919. A thousand miles is the maximum distance which is practicable; and, since the absolute non-stop cannot be adopted with a giant entry of mixed riders, a very indifferent machine can scramble through without dropping reliability marks. A stiff course is no longer a satisfactory eliminator; if the going is good, gradient will never stop a third-rate engine aided by a good gear box. If plenty of bad going, especially on hills, is included, the trial becomes a test of riders, and ceases

Impressions of the Arbuthnot Trophy.—

to be a test of machines. It seems evident that two principles, singly or in combination, can alone avail to safeguard the real function of the trial and concentrate its effort on the testing of machines. One is marking by teams instead of by individuals: the other is contrasting finishing condition with starting condition. In the past, teams have been limited to three machines, because manufacturers cannot furnish more than three riders whom they unreservedly trust; and teams of three are too small. The problem of awards by finishing condition is still more complex. Fundamentally, it requires a complete mechanical examination by a trained engineer: with perhaps 150 entries, such an examination is not practicable.

Finishing Condition.

On the other hand, some modification of Mr. Loughborough's Arbuthnot trophy system would constitute a test of finishing condition. If all the machines were subjected to a series of rather severe tests on the first day, and again on the last day, loss of tune would be shown up to some extent, especially if the tests consisted, for example, of a flying mile on Brooklands and a fast ascent of the Brooklands test hill. In conjunction with the reservation of the premier awards for teams of six riders—three trade and three amateur—we should get a real test of the machines, whilst a not-too-freakish route would save the trial from degenerating into a test of riders. Sporting rides should be reserved for amateur club fixtures and for the T.T.; the A.C.U. Six Days is as much a technical event as if it were held on the bench at Faraday House.

I sincerely hope Mr. Loughborough will publish a pamphlet embodying a map and route-finding directions for the Arbuthnot course. Many of our sporting riders travel west every summer looking for hills. The scenery is gorgeous to a degree, the route provides a magnificent practice ground for young riders who wish to complete their competitional education, and no man could find the way on his own.

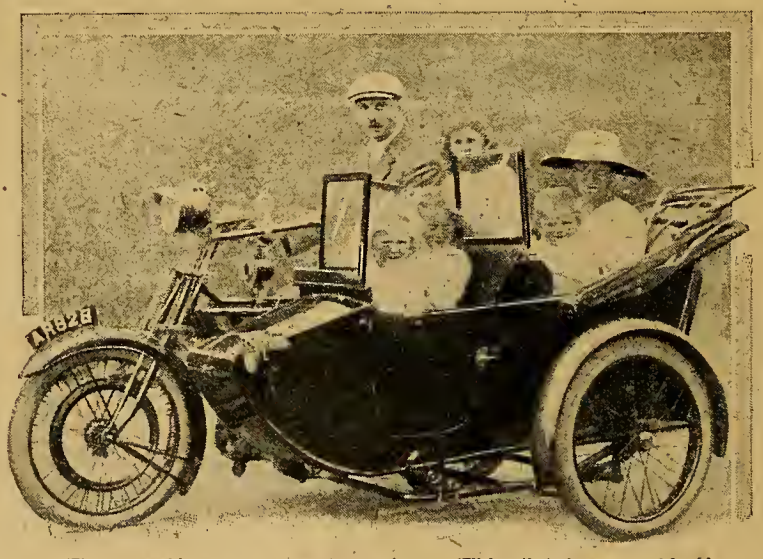
In conclusion, such a sporting fixture deserves extension. I should like to see Oxford v. Cambridge and the Army v. the Navy over similar courses, whilst any couple of provincial clubs would thoroughly enjoy an inter-club event under similar conditions. I commend the idea to club secretaries, with the reminder that sporting courses can be found almost anywhere. The signed non-stop card is probably fundamental in a 250 miles event of this kind.

THE FAMILY SIDECAR.

A 1919 8 h.p. Machine to Accommodate a Family of Six.

USUALLY the family man first buys his sidecar and then proceeds to find accommodation for his passengers. Judging from the number of crowded outfits on the road at the present time, the motor-cycling paterfamilias overcomes his difficulties with a fair measure of success, although in some cases the sidecarist who travels fairly light may consider that the machine is overloaded.

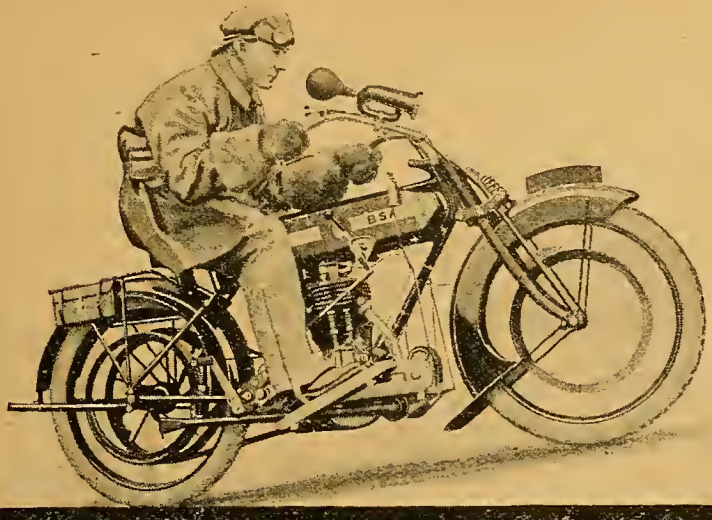
A Stevenage reader considered his problems before placing his order for his new machine, and the result certainly is a recommendation to other family men to give greater attention to the comfort of their passengers by a little foresight. The cycle chosen was a 1919 8 h.p. Enfield with the tandem sidecar fitted with a hood and screens. A Bradley pillion seat was fixed to the carrier, and, to protect the young occupant from draught, an apron was made which runs under the seat, behind the passenger's legs, and buttons up. The front seat of the sidecar supplied with the machine was discarded, and in its place two small seats were placed in a staggered position, which permitted the adult passenger to enter or leave the vehicle without disturbing the children. The rearmost of the two front seats is on the side nearest the motor cycle, which allows a long side screen to be fitted without fouling the handlebar. This seat is about 2in. higher than its companion, and both have back rests and arm rests which can be removed in a few minutes, and, incidentally, prevent the children opening the door when underway.



Where the sidecar scores over the runabout. With a little ingenuity, Mr. H. Woollard, of Stevenage, has adapted his sidecar outfit to carry in complete comfort a family of six. Such accommodation is impossible on any other vehicle with the exception of a large car.

To protect the rear passenger, the standard Enfield windscreen has been moved further back than the usual position, and the front screens are permanently fixed at an obtuse angle. The triangular space in front of the latter is covered in by waterproof twill, and the complete screen is made to fold down on to the fore "deck" of the body.

Our correspondent states that he has not found the load too much for the 8 h.p. Enfield, and that he attains speeds of 30 to 35 m.p.h.



The Tester

MEN BEHIND B.S.A. MOTOR BICYCLES

THE strenuous road tests for reliability to which each individual B.S.A. Motor Bicycle is subject before delivery form one of the strongest points in maintaining the quality of B.S.A. Motor Bicycles.

Every machine is taken out on the road by an expert tester, and subjected to strains and stresses far above the maximums required in ordinary motor cycling. The slightest defect is carefully adjusted, and the accuracy and efficiency of every part is under close supervision throughout these exhaustive trials, thereby maintaining the high standard for which B.S.A. Motor Bicycles are justly famous.

THE T.T., THE TRADE, AND THE USER.

By CAPTAIN WILFRED GORDON ASTON, R.A.F.

ONE feels a little diffident about opening a discussion on the advisability or otherwise of the Tourist Trophy Race because it is one which is more or less perennial, and the best part of all that can be said either for or against it has already been said before, not once but many times. It may be, however, that a new point of view can be found from which to review the various *pros* and *cons*, but if one fails in this endeavour, at least it can be claimed that the war which has altered all things has had its effect, though possibly an indirect influence, on the T.T.

Who pays? It is quite commonly asserted by the parsimonious motor cyclist, who can see no further than pottering, that the T.T., together with all other races and competitions whatever, costs a great deal of money, which eventually comes out of his, the user's, pocket, and he is unable to see that, inasmuch as the T.T. tends above everything else to develop speed capabilities, which do not appeal to him, that he is getting any value for his money. This argument does not quite justify the epithet "fallacious," but from an economic standpoint it is, to say the least of it, unsound, since the cost of all schemes of this nature, especially when entry into them is a matter of choice on the part of the manufacturer, falls upon the people as a whole and not upon any particular section of them. Motor cycles are a commodity the value of which bears a definite relationship to that of other commodities, and an amount of money spent upon developing the practice of motor cycling must therefore influence all other commodities.

The T.T. as a Teacher.

Again, supposing that a manufacturer elects to support the race, and sets aside a certain appropriation for this purpose, such appropriation either comes out of his profits and is expended upon the T.T. as upon any other kind of investment, or else it has to be spread over all the machines which he turns out, so that any possible loss is recouped directly. In this case it is obvious that a firm of motor cycle makers which never went in for any competition work of any kind ought to be able to sell its productions at a less cost than its rival which year after year went bald-headed for the T.T. Everybody, however, knows that this state of affairs does not exist, and it is therefore quite clear that if there are disadvantages there must be rebutting advantages. And so indeed there are. First of all there is the very large volume of information which is obtained, and which renders the Isle of Man an extraordinarily efficient research laboratory. Secondly, there is the important advertisement, not necessarily for the manufacturers of the winning machine, but for the whole motor cycling movement. This is where our friend the potterer comes in. He derives a distinct benefit from the T.T., no matter what kind of machine he rides, because the T.T. tends to expand the motor cycling movement and to increase the number of motor cyclists and the number of machines turned out, and it is only by such expansion that he can ever hope to obtain better and cheaper machines.

Benefits for the Winner—and the Rest.

Even if one single firm won the race year after year and the others never had a "look in," the above economic conditions are by no means vitiated, or indeed altered in the least, for so strong an advertisement for this lucky firm must necessarily and inevitably be a gigantic inducement to the less fortunate firms to obtain a similar advantage by other means. Whether the T.T. is won by luck or by merit makes not the slightest difference. So long as one firm gets a lead on the others, even though it may be temporary only, the rest must strive to show that they have as much, or more, merit, though they may have less luck. Hence they *must*, infallibly, endeavour to increase their merit in the eyes of the buying public, and this they can do only by developing and improving their designs in what the public is pleased to consider the desired direction.

I do not think it is necessary to continue this part of the argument because enough has been said to show that any form of competition which makes one a winner and another a loser must have a vitalising influence. Such being the case, I am myself strongly in favour of carrying them on—I had nearly said at all costs.

The Waste of Time.

The argument enlarged above, being on an economical basis, postulates a certain economic uniformity in conditions which, I would be the last to pretend, we are enjoying at the present time, and I am not at all surprised to find many persons who in the past have been all for the Isle of Man Race, Scottish Trials, and so forth, now opposing the holding of any competitions on the grounds that these things involve an interference with the ordinary routine of production, and an expenditure of time on the part of motor cycle manufacturers which could be more effectively devoted to other and possibly more important matters. This is, of course, a mere accident arising out of the war, and in normal times would be very rarely advanced as a serious objection. As far as I can see this argument holds no water at all. If the T.T. is justified in normal times it is even more justified at the present time when organisation for large production has scarcely had a chance to get "run in." Having

The T.T., the Trade and the User.—

made little or no practice-tested progress in the last four and a half years, there is all the more need to push forward development at the highest possible rate and to compress the maximum amount of experimentation into the shortest possible time. Now no private experimental work can ever be so searching or so complete as a public speed competition. One may easily satisfy oneself about the excellence of one's own design, but it is quite another thing to satisfy Mr. J. R. Nesbit that one is legitimately "First past the post." Long may that excellent sportsman live to discharge his judicial functions!

But there is another important point. Either a manufacturer enters a completely new design for the race, or else he goes in with a specially tuned up and very slightly altered "standard" model such as he is in the habit of selling in fair numbers to his customers. In the former case the amount of time he has got to devote to the T.T. is a mere trifle compared to the total time he *ought* to devote to necessary experiments and tests. In the latter case, to get a motor cycle ready, if it is really to be what it claims to be, will take up very little time indeed.

But in any case, if his works cannot spare a managing director, the designer and a tester or two for a week or ten days, he can reckon that his organisation is so bad that he is bound to go "broke" anyhow, and a holiday in the Isle of Man will at least put him in good fettle to face a meeting of creditors.

Startling Departures.

I assume for the purpose of the above argument that when a startling departure from previous practice is made the object is primarily to try out a design which it is hoped to standardise for the following season rather than merely to win with a freak. It is a fortunate and a significant fact that freaks never do win the T.T., and rarely anything else, so that the title of "Tourist Trophy" is still not a misnomer. If a maker produces a freak merely for the race, having no intention of utilising the design afterwards, he is clearly a lunatic, for, however *outré* the machine may be, the mere fact that it won will give rise to a demand which it is, or ought to be, his pleasure to satisfy. If the machine *doesn't* win it merely shows that the freak merchant is a fool, because he could have got more *réclame* by losing the race on something less freakish. This is where the value of the T.T. shows itself so admirably. It encourages progress on reasonable lines, it is intolerant of stagnation, it severely punishes retrogression, and it puts a crown of glory on the combination of brilliance *and* reason in originality. For myself, there is only one way in which I think that the race could be improved. I would like to see a special class, which could run in both Junior and Senior events, reserved for machines guaranteed by the manufacturers and tested and certified by the officials to be absolutely standard in all respects as offered to the public in the ordinary way of business. To measure and inspect them would not be at all difficult, and they could be allowed to run either complete with *all* touring equipment or at the discretion of the race organisers; they could be stripped in the usual manner. My opinion is that this scheme would add considerable interest to the event, and that manufacturers would learn a great deal from it. They would not be expected to win, but they could at least show that their ordinary machine was capable of standing up to a bucketing, and the mere fact of their entering a perfectly standard model, free of all reinforcements and special gadgets, would show that they were not lacking in confidence in their own products.

A cheerful owner and passenger on a Norton "Big Four." In spite of protests occasionally heard against pillion riding, this form of passenger carrying is still popular.

Minor Advantages of the T.T. Races.

As to the other advantages of the Tourist Trophy, these are many and various. It is, to start with, a magnificent spectacle, well worth a journey twice as far. It is a form of combining business with pleasure for the manufacturer, which has everything in its favour, especially in that it brings friends into rivalry and makes rivals friends. As a health resort, the Isle of Man at T.T. time is ideal, and the race makes it a stimulant to enterprise as well as a stimulant to lungs or digestion. It gives the industry in general a "guid conceit" of itself, and sends it back to smoky Birmingham and relaxing Coventry with a better grip on things and a determination to get on with the job.

Of course, it costs money—but then all experience is costly, and experience gained in the I.O.M. costs less than the failures of inexperience for which sometimes the public pay highly. In the Isle of Man the maker comes directly in touch with the failings of others' designs as well as his own, and they warn him where to be careful in future.

Finally, it is a veritable picnic for the people who write about it. Lots of hard work, but lots of interest!

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

MR. C. K. SHEPHERD, of Birmingham, has evidently expended a great deal of thought upon the flat twin two-stroke, of which a vertical section is shown in fig. 1. The cranks are set at 180°, so that both cylinders fire simultaneously, and, as the pistons move inwards, they compress a charge of gas already admitted into the crank case by a rotary valve. This valve is located vertically above the crank case, and is operated by worm gearing, the driving member consisting of teeth machined on the disc of the central crank web; dogs in an extension of the valve sleeve are utilised to drive the magneto. Many of the minor details of the engine are interesting. Each cylinder is integral with half of the crank case. The details of the crankshaft compression caps, and for taking thrust and wear of the rotary valve, deserve attention. The transfer passage is unconventional, and the inset drawing indicates how the cylinder wall is ribbed within the passage to steady the piston rings. Fig. 1a indicates how the contour of the cylinder head co-operates with the deflector on the piston in scavenging out the exhaust. The rotary valve and its gearing are wholly enclosed in the crank case, and the exhaust stubs form the lower means of attachment to the frame.

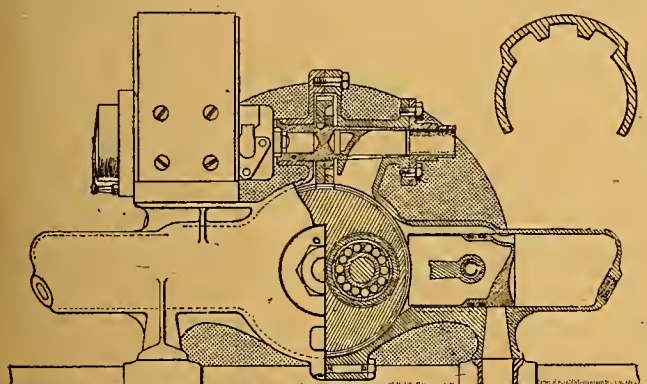

Fig. 1.—Part section and part elevation of C. K. Shepherd's flat twin two-stroke. For the sake of clearness the rotary valve is shown in fully open position, and one of the pistons at the bottom of the stroke. (Inset) Part cross section of one of the cylinders. No. 15,205. 26/6/14.

This patent is only one of many inventions concerning flat twin two strokes which have been brought to my knowledge recently. Designers of such engines appear to be more unanimous now as regards simultaneous firing, which shows they appreciate that mechanical balance is more important than splitting up the intervals of firing impulses.

Eliminating the Connecting Rod.

Capt. R. A. Yearsley (fig. 2) eliminates the usual connecting rod by using a trunk piston with a crosshead at its lower end: a block sliding on the crosshead provides a bearing for the crank pin. Many applications of this principle are practicable, and some of them are, of course, already patented; the inventor's claim is an arrangement under which a second piston may be fitted inside the trunk of the first piston. The following advantages are claimed:

1. Owing to the absence of gudgeon pin bosses, the interior of the piston can be machined, or the piston may even be formed of light steel tube.

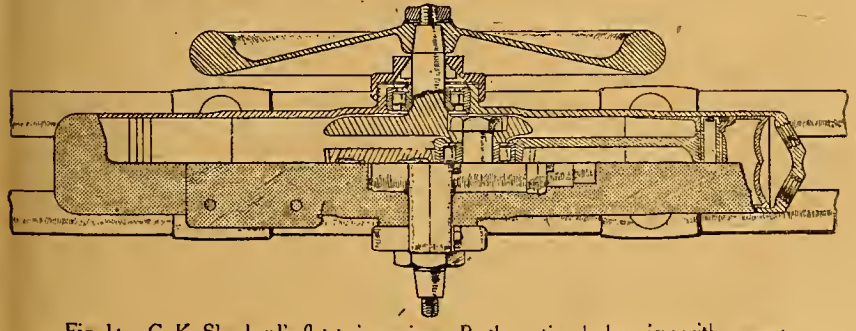

Fig. 1A.—C. K. Shepherd's flat twin engine. Partly sectional plan view with magneto removed.

2. The crankshaft can be mounted close up to the cylinder, and the overall height of the engine reduced.

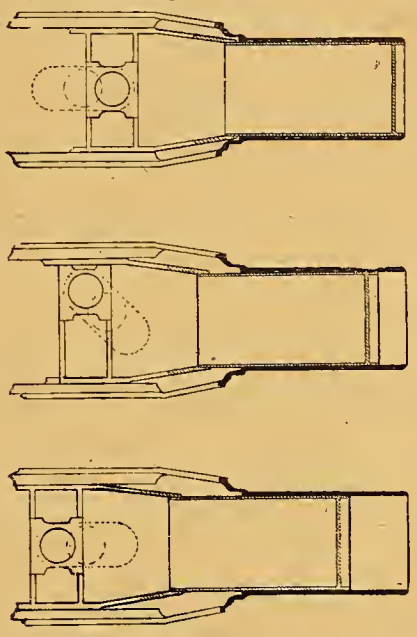

Fig. 2.—R. A. Yearsley's arrangement of opposed pistons and sliding big end device. No. 124,229. 22/11/17.

3. The thrust is taken "end on" by the trunk of the piston, and side strain is reduced.

As some readers may not be familiar with the crosshead and sliding crank pin bearing, this principle is illustrated in perspective. Fig. 2a shows the main piston and its connection to the crank pin in a series of diagrams, and how a second piston may be mounted inside the first piston, and coupled to a pair of narrow subsidiary crank pins (on the same crankshaft) by similar crossheads and sliding blocks. The basic principle is obviously applicable either to two-strokes or four-strokes, and to engines with horizontally opposed cylinders or of the "line ahead" type. The inner piston may be stationary, in which case the space between the two heads would serve as a compression chamber, the explosion occurring between crown of the top piston and the cylinder head: or the inner piston may be a working piston; or, again, the inner piston may be utilised to control the valve ports.

A Four-speed Gear.

The four-speed gear shown in fig. 3 is the invention of Messrs. Bagley and Bransom, who also protect modifications of a similar principle providing either two or three ratios. It forms rather a wide gear box, but this point is of no real import-

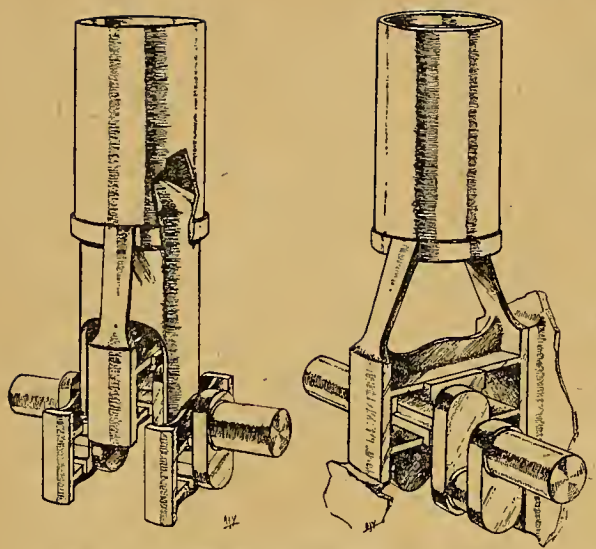

Fig. 2A.—R. A. Yearsley's pistons and cranks in perspective. No. 124,229. 22/11/17

ance, as the drive is always taken from a sprocket or pulley attached to the left-hand pinion on the main or upper shaft. The strong points of the design are that the gears are always in mesh, and all gear changes are effected by sliding the broad gear X: moreover, in any change, only one set of dogs is engaging or disengaging at a time. The various ratios are obtained as follows:

Top (direct) *via* X (moved to the left) and A. 2nd, *via* X (moved to the right), B, C, and A. 3rd, *via* X (moved further to the right), D, E, F, C, and A. 4th, *via* X (moved still further to the right), B, G, D, E, F, C, and A.

Note that the gear X is broad enough to engage with B in all its positions, and that the two dog clutches, H and J, on the layshaft are connected to the gear X, and always move with it. A suitable kick starter is included in the patent.

A Kick-starting Device.

Messrs Veloce, Ltd. (fig. 4), in conjunction with Mr. P. J. Goodman, have devised a kick-starter, which appears to be simple, well protected, and reliable. It incorporates a free-wheel, which has often proved unsatisfactory on such devices in the past, as ordinary free-wheels occasionally convert themselves into fixed wheels: little imagination is required to see that a kick-starter which waves its pedal without invitation is a sad nuisance. The salient features of the Veloce safeguard are the shoulder A on a rotatable disc which interacts with the rollers of the free-wheel, and the fixed shoulder B in the stationary cover of the starter.

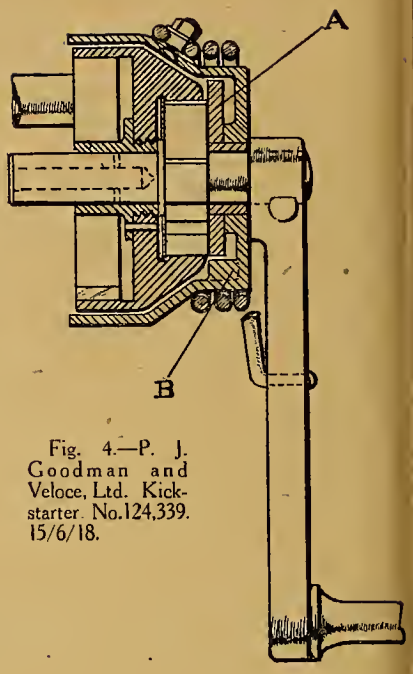

Fig. 4.—P. J. Goodman and Veloce, Ltd. Kick-starter. No.124,339. 15/6/18.

Springing the Rear Wheel.

Many designers of spring rear frames for motor cycles have puzzled over the problem of springing the rear wheel in such a fashion that its dips and rises do not affect the tension of the rear chain. The accompanying drawing (fig. 5) shows a solution propounded by the Coventry Acme Motor Co. and Mr. W. J. Robb. The system embodies a three-step drive: a countershaft fitted behind the gear box forms the hinge on which the radius rods, carrying the back wheel, are hinged. The other details are self-explanatory, though two minor points deserve attention. One is that this firm avoids the common blunder of making two chains share a single adjuster; the gear box is horizontally adjustable on an L shaped bracket, and this bracket is vertically adjustable on the crank case, thereby affording independent tension for the chain from the gear box to the countershaft. The other feature is that since no gear reduction is necessary in the rear chain, a neat and compact chain case is practicable. The springs and radius rods come outside the rigid rear triangle of the frame, and their freedom of upward movement is limited only by the stiffness of the springs and not by external considerations.

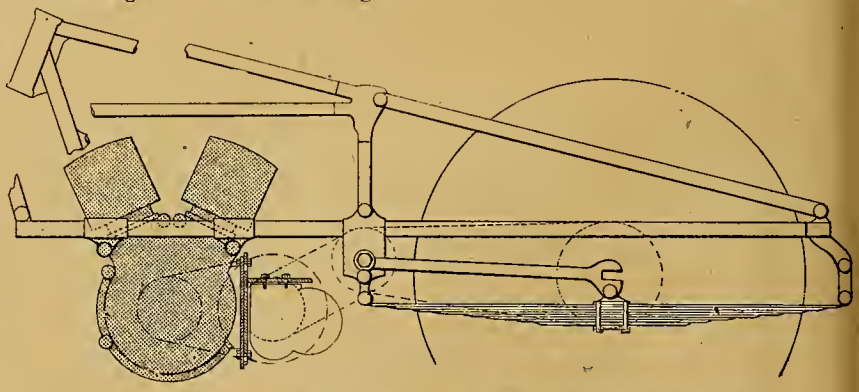

Fig. 5.—Coventry Acme Motor Co., Ltd., and W. Robb, patent spring frame. No. 124,094. 25/4/18.

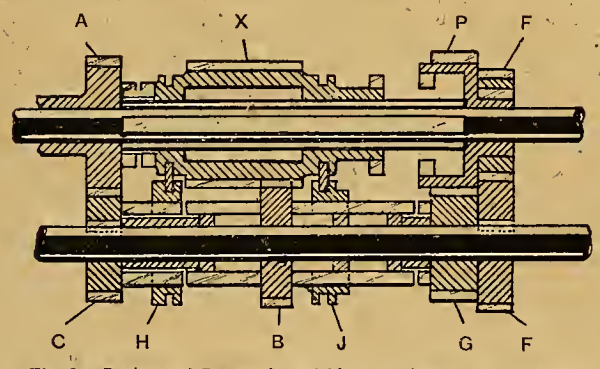

Fig. 3.—Bagley and Branson's variable speed gear. No. 124,602. 10/4/18.

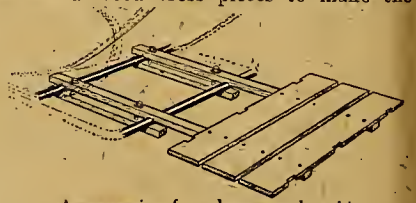
A HOME-MADE SIDECAR LUGGAGE CARRIER.

THE sidecar luggage carrier, shown in the accompanying sketch, can be easily made at home. Two pieces of wood about 2ft. 6in. long are bolted to two shorter pieces about 12in. long, depending on the distance between the two parallel tubes of the sidecar chassis. On this wooden extension of the chassis are screwed wood cross pieces to make the



A suggestion for a home-made grid.

platform for the luggage. It is an advantage to cut slots in the two outer pieces of wood forming the platform, through which straps to hold on the baggage can be threaded.

Day Trips and Week Ends

BY CHAS. S. HARPER

I.

BIRMINGHAM TO BUILTH.

Some Delights of the Road into Wales.

The picturesque old bridge spanning the river Teme at Ludlow.

BIRMINGHAM is fortunate in being situated within such easy reach of the most delightful kinds of country; whether it be to Central Wales, on the one hand, or the great Midland regions on the other; while, of course, the Shakespeare country—that region which is the real true England—lies at its very door.

But I have no space for a disquisition at length upon these advantages; and will set forth at once upon this selected short trip to the gates of Wales. The tourist can do it comfortably in a day. You should start from Birmingham with pleasant anticipations, for the way out of the city is by Paradise Street and Easy Row; and if this does not quite look the paradise it is named, at any rate, the name, with that of Easy Row itself, is of favourable augury. I am not out to describe the Hagley Road, nor Beech Lanes, nor Quinton, and the little town of Halesowen does not, in fact, greatly appeal to me, even though the poet Shenstone lies in the churchyard; for he was the melancholy versifier who wrote believing that the mercenary welcome of hotels was the warmest reception the traveller was ever likely to meet:

"Whoe'er has travelled life's dull round,
Where'er his stages may have been;
May sigh to think how oft he found
The warmest welcome —at an inn."

I think perhaps Shenstone painted unconsciously a portrait of himself there. I picture a desolating, crabbed sort of person, who, when his friends perceived him approach, exclaimed, "D—n! Here's that perisher again"; or eighteenth century language equivalent.

And so we proceed to Kidderminster, not, I think, for Kidderminster's own sweet sake, but for Wribbenhall, where we cross the Severn at a picturesque spot, and come into Bewdley. All around spreads the so-called "Forest" of Wyre, a region of scrub-woods rather than of stately trees: a district which those who originally named Bewdley considered to be exceptionally beautiful; for the present name is a corruption of the French "Beau lieu." So our remote forbears had an appreciation of scenery; for not only Bewdley, but Beaulieu in Hampshire; Beaudesert, Staffordshire; Beaumaris, Anglesey; and Boscobel, Shropshire are named from the same love of their situation.

Bewdley town will strike a Birmingham man as a "has been" among towns. Its broad, empty street, with the parish church at the top of the rise, is empty enough as a rule to echo to the sound of the passing motor cyclist; and to afford a quiet spot in which a sleepy dog may go to sleep on a sunny afternoon. I daresay there may be busy times at Bewdley—only never have I happened upon them; and the stately old mansions seem to me full of memories and ghosts.

The Narrows and Buttercross, Ludlow.

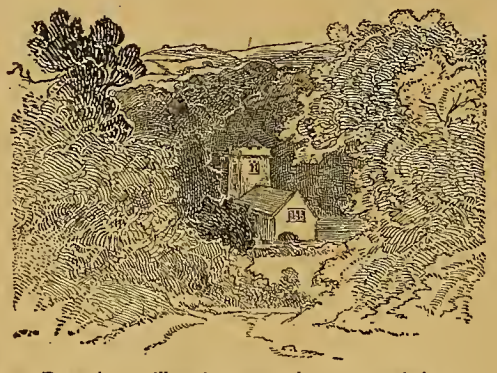
It is a long, long continuous rise out of Bewdley, up Gallow Hill; and even then you have by no means done with it, whichever way you elect to proceed to Ludlow, whither we are now bound. At the road fork, you keep right for the way by Cleobury Mortimer, and left for that through Mamble and Tenbury. To the right is the shorter route by 4¼ miles, but you have to go down and then up; very much up, past the village of Cleobury Mortimer, climbing to

Day Trips and Week-ends.—

Hopton Bank, which is very near the highest point of Titterstone Clee, that vast stony hill of basalt from which is quarried the "dhu stone" so largely used for "macadamising" roads. Plentiful evidences of that industry are seen on that stark and grim hill-top, as you pass. It is not a lovely spot. But you get it all back in the glorious run down Angel Bank, which brings you within two miles of Ludlow.

As for the other way (which I prefer), you must needs go over the crest of that other considerable eminence, Clowes Top, down to Mamble. Having done so, the pretty valley of the River Teme is reached, where the hop gardens are, and Tenbury on the other side of the river, looking at a distance much more beautiful than it really is. I could write something eloquent on places that look at a remove more lovely than they are, but I refrain.

Anyway, we don't go into Tenbury, and so run no risk of disappointment. Away on the left, the church tower of Burford is soon seen: a lovely little church, with the monument and heart-shrine of Edmund Cornwall, who, dying at Cologne in the reign of Henry VI., wished his heart sent to England. Here is also the monumental effigy of the Princess Elizabeth, sister of Henry IV. Passing Little Hereford, which is so little that it is scarce to be noticed, and then Wooferton Junction, you reach Ludlow in a further four miles.



Dyserth, a village in name only, now consisting simply of a church and a solitary house.

You come into Ludlow over the Teme, at Ludford; that tiny village with the old manor-house of the Charltons, the pretty old parish church with its red-robed effigy of Sir Job Charlton, Judge and sometime Speaker of the House of Commons, and the "Charlton Arms." Halt awhile on Ludford's ancient bridge and look up and down the river, with its foaming weirs.

The Marches of Wales.

Ludlow town lies displayed before you: the approach up Broadgate, with the old arch and gateway, surviving from the days when Ludlow, as well as its great castle, was provided with fortress walls; and, cresting the highest point in the town, the great church of St. Lawrence, of almost a cathedral dignity.

Under the archway, and up the Broad Street to the Buttercross, and you are in the centre of Ludlow, at the extremely cramped centre aptly called "The Narrows." The Buttercross, as seen by the accompanying illustration, is not a cross but an eighteenth century market building. Most of the streets just here are, more exactly, alleys. It is by an alley you come to the church, well worth a visit, with its noble choir, rich ancient stained-glass, and the quaint carvings of its *miserere* seats: one of them representing, with much humour, a man drawing beer from a cask.

Ludlow, of course, was of old the seat of government of the Marches, or borderlands, of Wales. Hence its stately aspect: hence also the old "Feathers" inn, in Corve Street. The castle, in ruins, stands on its wooded height at Dinham, overlooking the Teme, rather secluded from the streets, and silent, save for the cawing rooks, making gobbling and choking noises up in the branches of the tall wych-elms.

Dames of the Civil War.

Down Corve Street and to the left, for Bromfield, and thence along pleasant byways to the quaint village of Leintwardine ("Lantardine" locally), on the River Clun. Less than three miles beyond it is Brampton Bryan. I confess greatly to liking the name of the place. It sounds forceful: try it! And at least one forceful person lived there, at a comparatively late period. A lady, too; the famous Lady Brilliana Harley: one of those remarkable combatant dames who, in the Civil War between Charles I. and his Parliament, defended on one side or the other their absent husbands' castles better perhaps than could have been done had they been at home. She for a long while withstood a siege of Brampton Bryan castle, but had at last to surrender to the Royalists. The ivy-clad ruins remain in the park, readily accessible from the road.

At Knighton, some five miles on, we enter Radnorshire. It is a little town, of some amazingly steep streets; the "Norton Arms" Hotel, where anglers and golfers foregather; and the remains of Offa's Dyke on the hillside. If you have a mind for quaint places and ruined castles, Clun, worth seeing, is seven miles to the right. But straight ahead for Builth, by the grand and good mountain road past Monachty, Bleddfa, Llanvihangel - rhyd - Ithon, and Penybont. At Cross Gates, a left turn leads past Llanbadarn Fawr, into Llandrindod Wells, at this season of the year coming into its own, as the chief health, golfing, and motoring place of Central Wales.

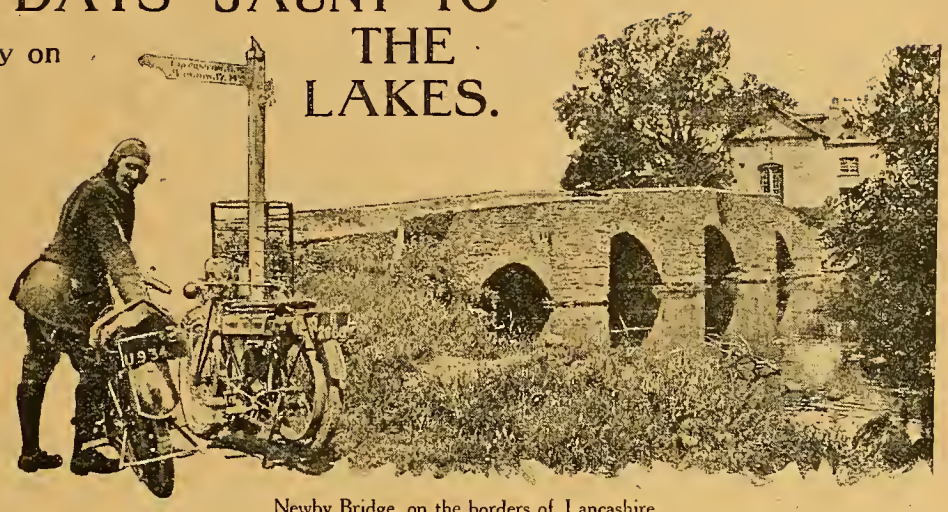
Really and truly, the typical Welsh villages are not beautiful. But Llandrindod long since ceased to be a village, and what there was of the little old-time place has vanished in the growth and rebuilding of the present town. There is scenery even in the very midst of Llandrindod; in the Rock Park, and at the craggy spot on the River Ithon called "Lover's Leap"; while all around are the mountains and the tiny villages. There, for example, is Dyserth, so tiny indeed that it is not even a village. Just a church and a house; and there are many others, which the explorer with a day or two to spare will discover for himself. And, high above the town, past the hillside lake and the old church, which is the only ancient thing in Llandrindod, are the golf links.

Not quite eight miles beyond the town, we reach the smaller and older town of Builth, which stands at a junction of roads whence you branch off for anywhere. But, probably, having reached that dull little place, you will feel inclined to return those eight miles to the brightness and cheerfulness of Llandrindod, to stay the night.

The chief distances are: Birmingham to Kidderminster, 17 miles; Bewdley, 20; Ludlow, 43¼; Knighton, 60; Llandrindod Wells, 78½; Builth, 85¾.

A TWO DAYS' JAUNT TO THE LAKES.

A Sentimental Journey on Sporting Mounts.



Newby Bridge, on the borders of Lancashire.

WE planned it many moons ago: in the dim days of Armageddon, when four thousand miles separated us. It was to be the celebration of our reunion: a dash to the Lakes!

I was surprised one evening by a visitor who drifted into the garage familiarly, and I turned, doubting. There, bronzed by the sun of the East, he stood—John!

What about a 'bus? What about the Lakes? What about it—generally?

Despite the shortage, we hoped. The local paper built our hope: "1913 T.T. Triumph," etc. We rushed, we viewed, we bartered, and bought it!

"When? Whitsuntide! Where from? Leeds."

"How long? Two days! . . . "

We started over the old familiar Otley Road. What a gay morning! On the moors by Clapham and the rising height of Ingleborough the Triumph burbled alongside. "I've been longing for these cool grey-greens of the Pennines after India's eternal glare," called my companion.

From Kendal to Windermere we took the main road through Staveley, and found it infested with motor chars-à-bancs: positive dangers on these narrow lanes.

Through Bowness we had quieter paths, photographed the inevitable Newby Bridge, then to Coniston, where I, perforce, did lurid cornering to catch and warn my friend of a sorrowfully remembered gate on a twisting hill. After gaining the lead I was "ponking" slowly upwards in a manner delightfully peculiar to my long-stroke Norton, with its Phillipson pulley, I heard a "blacksmith's song" from behind, and the call, "Either go on or let me!" I drew aside, and the Triumph accelerated: my warning was vain: he found the gate!

We cooled our ardour in a stream, then trickled side by side sedately *via* Grasmere into Ambleside.

"Shall we stay the night here?" I called.

Attractions on the side walk not peculiar to this district decided us.

We stayed!

The lake and mountains shimmered in the haze of the evening sun, but the idyllic calm was shattered by the brazen music of a travelling show, a repertoire of one item being repeated continuously from seven till eleven!

However, Ambleside had its compensations, and the morning found us with light hearts. Rain had fallen, and mist rested on the hills when we left Ambleside at 8.35. Passing Windermere and Bowness, we dashed at the two-mile climb to Crook, and at full throttle thundered up side by side, the exhausts blending at times in a single harmonic note delightful to hear.

With the clock on nine we entered Kendal, and thereafter, sacrificing average speed for comfort, we toured down to Leeds in time for lunch.

WHARFEDALE.

Crippled Children's Outing.

A hundred and forty-five sidecars, runabouts, and cars recently conveyed 600 crippled children from Manchester to Sabley Park, Knutsford.

Scottish Six Days.

The ascent of Applecross is much better than in 1914, owing to the fact that the large tufts of grass, which so deadened the effect of the engine, have been removed. The competitors will encounter many stretches where the roads have been cut up by tractors hauling timber. These patches are almost impossible for the solo rider, and necessitate miles of low gear work, possibly with a toss or so into the ditch.

A High Average Speed.

An instance in which the speed and reliability of the motor cycle, in the hands of an expert, was employed in the service of the illustrated press is recorded in connection with the rapid publication of the Versailles Treaty photographs by a Scottish paper.

The plates were brought from Paris to London by aeroplane, and then carried to Glasgow by A. J. Sproston on a Lea-Francis. The journey was made with only two replenishment stops, and his average speed is reported to have exceeded 40 m.p.h.

Imports and Exports.

The Board of Trade returns for June show that motor cycles and parts to the value of £5,316 were imported during the month. For the most part, this represented parts and accessories, the value of the complete machines being only £366. The value of machines, parts, and accessories imported during June last year was £109.

EXPORTS.

Fewer motor cycles were exported during June than was the case in the corresponding month in either 1917 or 1918. The 1917 June returns show that 50% more machines were sent overseas, although export values remain pretty much the same as this year.

	1917	1918	1919
Number of machines	1,088	1,037	678
Motor cycles, parts and accessories ...	£80,957	£92,759	£79,070

Stolen Machines.

The theft of motor cycles is now so prevalent that we are becoming quite accustomed to a weekly batch of complaints. The following have been reported during the last few days :

B.S.A., 4¼ h.p., chain-cum-belt, 1919 model, registered number AW 4606, engine No. 28,606, frame No. 28,587, Dunlop non-skids, P. and H. lamps, oil filler cap of gear box missing. Information wanted by the Superintendent, Salop County Police, Shrewsbury.

Triumph, 1919, 4 h.p. solo, registration PA 3923, engine No. 62,313, frame No. 289,839, magneto No. 32,557. Was stolen from a closed yard at the Royal School of Mines, South Kensington. Information to the Editor.

B.S.A., 4¼ h.p., type K, registration BY 3851, engine No. 30,021, frame No. 30,393, with sidecar. £10 reward offered by Premier Motor Policies, Ltd., New Broad Street, E.C.2.

A 6 h.p. three-speed, chain-driven A.J.S. and sidecar, 1919 model, registered DA 3416, but no engine number, was stolen from Wolverhampton on July 2nd. Mr. Stevens, the owner, offers £10 for information leading to its recovery. The engine has extra long cylinder barrels and valve stems; the machine has a celluloid folding screen, Dunlop tyres, and Lucas dynamo lighting set.

A 1914 clutch model Douglas was stolen from the Royal Aircraft establishment, South Farnborough, recently. The registration number was AA 6827, engine No. 15,690. Any reader offered the machine should communicate with the police or the owner, Mr. W. Hopgood, High Street, Hartley Wintney, Hants.

This unwelcome interest in the unfortunate owners' machines should act as a warning to all uninsured riders to cover themselves fully against similar losses.

A challenge cup presented by the B.S.A. Co., Ltd., as the premier award in the Redditch and District Motor Cycle Club Reliability Trial, an event which takes place on Aug. 23rd.

Special Features.

THE T.T., THE TRADE, AND THE USER.

DAY TRIPS AND WEEK ENDS.

Government Sales at Birmingham.

Surplus W.D. machines have brought in as high prices when sold in the heart of the trade as elsewhere. The sale of used and unused motor cycles at Birmingham, on the 8th inst., was attended by some two thousand persons, and as the machines were sold singly the bidding was keen. The sale realised a total of £8,250. Unused Douglas 2¾ h.p. machines averaged £71 each, and accounted for £3,350 of the total; while "unfit" Triumphs averaged £21 each.

Edinburgh and District M.C.

The following are the results of the open hill-climb at Redstone Rigg :

CLASS 1.—HANDICAP FOR LIGHTWEIGHTS WITH ENGINES NOT EXCEEDING 400 C.C.

	Time, Secs.	Figure of Merit.
1. A. H. Alexander (2¾ Douglas)	41	2.8892
2. C. R. Duncan (2¾ Douglas)	46.2	2.8320
3. A. L. Downie (2¾ A.J.S.)	43	2.8019

CLASS 2.—HANDICAP FOR MACHINES WITH ENGINES FROM 401 C.C. TO 600 C.C.

1. A. J. C. Lindsay (3½ Rover)	39.8	2.8432
2. Jas. Beck (3½ Sunbeam)	46.2	2.7774
3. G. L. Stark (3½ Rudge)	50	2.7168

CLASS 3.—HANDICAP FOR MACHINES, UNLIMITED ENGINES.

1. J. R. Alexander (2¾ Douglas)	44.8	2.8451
1. A. J. C. Lindsay (3½ Rover)	39.8	2.8451
3. Geo. Grinton (7-9 H.-Davidson)	37	2.7690

CLASS 4.—HANDICAP FOR PASSENGER MACHINES UP TO 1,100 C.C.

1. A. T. Brash (7-9 H.-Davidson)	44.6	2.8279
2. A. U. R. Downie (5-6 Ariel)	47.8	2.8006
3. Geo. Grinton (7-9 H.-Davidson)	45.4	2.7754

CLASS 5.—HANDICAP FOR PRIVATE OWNERS.

1. A. L. Downie (2¾ A.J.S.)	42.4	2.8099
2. C. R. Duncan (2¾ Douglas)	48.4	2.8068
3. Jas. Beck (3½ Sunbeam)	46.4	2.7729

CLASS 6.—HANDICAP FOR RIDERS UNDER 18 YEARS OF AGE.

1. Allan Fairley (2¾ Douglas)	56.4	—
2. T. R. Bonnar (3½ Triumph)	62.2	—

CLASS 7.—SCRATCH FOR LIGHTWEIGHTS WITH ENGINES NOT EXCEEDING 400 C.C.

1. A. H. Alexander (2¾ Douglas)	39	—
2. A. L. Downie (2¾ A.J.S.)	44	—
3. C. R. Duncan (2¾ Douglas)	48.4	—

CLASS 8.—SCRATCH FOR MACHINES WITH ENGINES FROM 400 C.C. TO 600 C.C.

1. A. J. C. Lindsay (3½ Rover)	40.4	—
2. W. R. Feowick (4 Triumph)	45.4	—
3. Jas. Beck (3½ Sunbeam)	45.8	—

CLASS 9.—SCRATCH (UNLIMITED).

1. A. H. Alexander (7 Indian)	33	—
2. R. Boyack (8 Bat)	35.2	—
3. A. T. Brash (7-9 H.-Davidson)	38.2	—

CLASS 10.—SCRATCH FOR PASSENGER MACHINES UP TO 1,100 C.C.

1. A. H. Alexander (7 Indian)	39.8	—
2. A. T. Brash (7-9 H.-Davidson)	44.2	—
3. Geo. Grinton (7-9 H.-Davidson)	44.4	—

The Motor Cycle to the Fore.

When R34 landed at Mineola, Maj. Pritchard was the first to reach the ground to give instructions to the landing party. He was taken to headquarters in a motor cycle and sidecar.

Prize Draw for Motor Cycle.

A grand prize draw is being organised in aid of the Ravensthorpe Division of the St. John Ambulance Brigade, the sole prize being a 2½ h.p. Metro-Tyler motor cycle. The hon. sec. is Mr. W. Ledgard, 42, Broomer Street, Ravensthorpe, Dewsbury, Yorks.

Paris-Rheims-Paris Trial.

The following are the results of the recent Paris-Rheims-Paris trial, which are based on time errors at a secret check :

SOLO.—350 C.C. CLASS.

1. Colombel (Douglas), full marks.
2. Favart (Douglas), lost 19 marks.

SOLO.—500 C.C. CLASS.

1. Meurot (P. and M.), full marks.
2. Barthélemy (Rover), full marks. Ruet (Rover), full marks.

SOLO.—750 C.C. CLASS.

1. Delabre (Rover), full marks.
2. Isody (B.S.A.), full marks.
3. Bernard (Indian), full marks.
4. Mangis (Douglas), lost 1 mark.
5. Martiney (Triumph), lost 2 marks.

SIDECARS.—750 C.C. CLASS.

1. Le Pen (G.L. sc.), full marks.
2. Lacour (G.L. sc.), full marks.
3. Detruche (G.L. sc.), full marks.
4. Delauné (B.S.A. sc.), full marks.
5. Péan (Peugeot sc.), full marks.
6. Fasola (A.J.S. sc.), lost 6 marks.
7. Roger (G.L. sc.), lost 9 marks.

SIDECARS.—1,000 C.C. CLASS.

1. Conrelli (Indian sc.), full marks.

Memorial Service to Fallen Motor Cyclists.

A memorial service in memory of those motor cyclists who gave their lives in the great war 1914-19 was held at St. James's, Piccadilly, on Friday of last week. The service was taken by the Vicar of St. James's Church, and the short service was followed by an address by the Rev. E. P. Greenhill, M.A., Temporary Chaplain to the Forces. Among those present were Col. A. E. Davidson, D.S.O., one of the vice-presidents of the Auto Cycle Union; Mr. James Nisbet, chairman; Major T. W. Loughborough, secretary; Major Dixon Spain, assistant secretary; Messrs. H. P. E. Harding, E. M. P. Boileau, and Alec Ross, members of the committee. Among the congregation were numerous despatch riders in uniform.

The Arbuthnot Trophy.

A fitting termination to a unique and splendid trial was the small dinner given by the Auto Cycle Union to the winner of the trophy and the Motor Cycling Club's special prize at the Royal Automobile Club on Friday night. There were present Lt. E. S. K. Evans-Greaves, R.N., the winner; Mr. A. W. Torkington, a vice-chairman of the A.C.U. committee; the Rev. E. P. Greenhill, chairman of the A.C.U. Competitions Committee; Maj. T. W. Loughborough, secretary of the A.C.U., Mr. A. V. Ebblewhite, timekeeper; Mr. E. M. P. Boileau, *The Motor Cycle*, the originator of the suggestion for commemorating the gallant death of the late Rear-Admiral by means of a trophy, representing the Motor Cycling Club, and Mr. Selby.

The table was tastefully decorated, and Lady Scott's excellent statuette of the Admiral was the centre piece. The proceedings were quite informal, and the only toast was that of His Majesty the King. In the course of the evening, Lt. Evans-Greaves, the winner of the trophy, said he would like to present two small cups, one to Lt. H. T. Back, who came in second, and one to Sub-Lt. Everett, who performed so well in the consistent driving test. The latter was a real novice, and the Triumph he rode was his first mount. This was very keenly appreciated by the A.C.U. An excellent suggestion was made that in subsequent years the winners of previous Arbuthnot Trophy Trials should be invited to the dinner, which would be an annual affair.

Official Results of Midland C. and A.C. Motor Cycle "Long Day" Trial.

CHIEF AWARD FOR BEST PERFORMANCE OF THE DAY (M.C. and A.C. Trophy).—H. B. Denley (8 Morgan), flexibility figure of merit 2.78.

AWARD FOR BEST PASSENGER PERFORMANCE (Jordison Trophy and gold medal).—H. B. Denley (8 Morgan).

GOLD MEDALS IN PASSENGER CLASS.—F. W. Giles (6 A.J.S.), 102 marks; J. Stevens (6 A.J.S.), 102 marks; L. Newey (4¼ Ariel), 102 marks.

SILVER MEDALS IN PASSENGER CLASS.—D. S. Heather (4¼ B.S.A.), 92 marks; F. Smith (8 Clyno), 95 marks; J. E. Greenwood (8 Sunbeam), 92 marks; F. J. Watson (3½ Ariel), 90 marks; J. L. Stocks (6-7 Ariel), 92 marks.

AWARD FOR BEST SOLO PERFORMANCE OVER 350 C.C. (*Trader* Trophy and gold medal).—G. E. Stobart (4¼ James), flexibility figure of merit 1.38.

GOLD MEDALS IN HEAVY SOLO CLASS.—L. L. Sealey (4¼ B.S.A.), 102 marks; G. A. Strange (5-6 James), 102 marks; H. J. Stretton-Ward (4 Triumph), 100 marks.

SILVER MEDALS IN HEAVY SOLO CLASS.—A. J. Dowler (3½ Sunbeam), 95 marks; J. A. Watson Bourne (4 Blackburne), 90 marks; G. Dance (3½ Sunbeam), 98 marks; J. Dudley (3½ Sunbeam), 97 marks; H. Minton (4 Norton), 92 marks; J. A. Newman (3½ Sunbeam), 92 marks; T. Peck (3½ Ariel), 92 marks.

CHIEF AWARD FOR BEST SOLO PERFORMANCE, 350 C.C. AND UNDER (*B.N.* Bowl and gold medal).—E. Williams (2¾ A.J.S.), flexibility figure of merit 2.429.

SILVER MEDALS IN LIGHTWEIGHT CLASS.—H. Newey (2¼ Levis), 90 marks; A. H. Johnson (2¾ Allon), 90 marks; W. B. Gibb (2¾ Douglas), 92 marks.

WINNER OF SPECIAL PRIZE FOR LIGHTWEIGHTS OF 275 C.C. OR UNDER.—H. Newey (2¼ Levis), 90 marks.

WINNER OF SPECIAL PRIZE FOR PRIVATE OWNER.—H. B. Denley (8 Morgan), 102 marks.

WINNER OF SPECIAL PRIZE FOR BEST CLUB PERFORMANCE.—T. Peck (3½ Ariel), 92 marks.

Sheffield Trial.

The Sheffield and Hallamshire M.C.C. are holding a trial next Saturday for the Stacey Cup over a course including Sutton Bank. Secret checks have been eliminated, and awards will be made on a system of marking designed to find the best performance entirely on merit and efficiency.

To Welcome Home Demobilised Motor Cyclists.

A meeting of prominent Midland motor cyclists was held last Friday evening in Birmingham to consider the question of organising some form of welcome home for the many motor cyclists who had joined the Forces. Sir William Bowater was in the chair, supported by Messrs. E. Humphries and G. Williams. A strong committee was formed, with Mr. Humphries as chairman, and Sir William Bowater was elected president, and no doubt a successful event will be organised.

Scottish Six Days Trial (July 21st to 26th).

Additional entries, subsequent to the first ballot, are as under noted :

W. Deans (3½ Ariel)
B. Alan Hill (Morgan)
W. Westwood (4 Triumph)
R. Hendry (5 Indian)
W. Strettell Miller (3½ P. and M.)
H. Moir (3½ Sunbeam)
J. L. Stocks (6-7 Ariel sc.)
L. L. Sealey (4¼ B.S.A.)
George Wray (8 Clyno sc.)
Vivian Olsson (4 Douglas)
Geo. Grinton (Harley-Davidson)
A. L. Downie (6 A.J.S.)
A. Downie (6 A.J.S.)
A. Downie (5-6 Ariel)
J. Emerson (3 A.B.C.)
Walter Young (4 Triumph)
Jesse Baker (3¾ Scott)
Mrs. Bell (6 A.J.S. sc.)
D. Bell (6 A.J.S. sc.)
L. S. Fisher (3½ Norton)
W. Hoyland (3½ Norton)
Capt. Hay-Will (6 A.J.S. sc.)
R. Carfrae (6 Bradbury sc.)
D. Wright (3¼ B.S.A.)
R. Clark (4 Douglas)
H. E. Fairley (4¼ B.S.A.)
—. Choldcroft (——)
D. Balloch (8 Matchless sc.)
— Parsons (8 Enfield sc.)
Lt. Jamieson (——)

F. Jeynes (3½ h.p. Humber) restarting on Edge Hill in the Humber Co.'s staff trial last Saturday. (See page 69.)

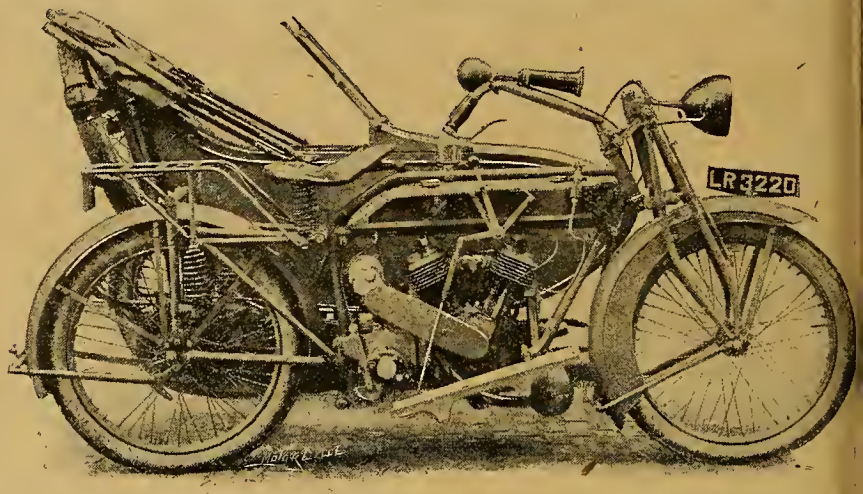
THE 1920 MATCHLESS.

Coil Spring Suspension, Kick-starter and Automatically Operated Exhaust Valve Lifter.

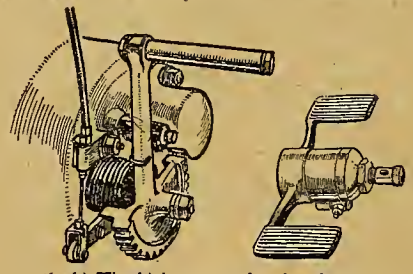
OUR last experience with a Matchless sidecar outfit was in the spring of 1918, when a military model, of the type ordered by the Russian Government, was placed at our disposal by Messrs. Collier and Sons, Ltd., Plumstead Road, Woolwich. The 1920 outfit is a very different proposition, and though it has still a "war finish" and a sidecar body which is not standard, it is a vastly superior affair. It possesses three very notable innovations—the spring frame, the kick starter-operated exhaust lift, and a single-lever carburetter, all very important features in motor cycle construction. It is the first motor cycle we have driven since 1903 which has not had an exhaust lifter on the handle-bar. The engine is controlled by the throttle spark alone, and the exhaust valves are raised for starting by means of a cam on the inner side of the kick starter quadrant, which, on the pedal being depressed, comes in contact with a trip on the exhaust lifter arm, which is hinged on a bolt at the base of the gear box. The valves remain raised during one-third of the quadrant's travel, the trip then slips off the cam, and the valves are dropped just at the correct moment. Also the engine may be stopped by depressing the pedal.

The 8 h.p. J.A.P. engine only departs from standard in one special feature, and that is the leading of an oil pipe directly from the J.A.P. automatic oiling system to the clutch bearing. The Claudel-Hobson single-lever carburetter renders the engine delightfully flexible and gives ample power. There is an item in the construction of the frame which is worthy of mention. The saddle tube is extended below the level of the bottom bracket and terminates in a lug from which runs a short stay to steady the forward chain case, while the other side of the lug serves to hold one of the six sidecar connections.

As regards the springing of the frame, this is particularly well carried out. To explain it briefly, the sprung portion forms practically a triangle, and, what is most important, it includes the luggage carrier, while the unsprung portion forms practically a rectangle, the base forming the chain stays, which are hinged at their forward ends. The rear vertical members are hinged top and bottom, and are braced by a tube across their top ends, the inner one of which terminates in a joint for the rear diagonal sidecar stay. Vertical coil springs take the road shocks between the sprung and unsprung portions of the frame. Every joint in the spring frame is provided with lubricators situated at convenient points, and the tubes are drilled to conduct the oil directly to the bearings.



The spring frame Matchless fitted with 8 h.p. J.A.P. engine.



(Left) The kick-starter showing the automatic exhaust valve lifting mechanism. (Right) The clutch pedal.

Control, as previously stated, is carried out mainly by the throttle, which, with the front brake lever, are the only two on the handle-bar. There is a spark lever on the tank. The clutch is actuated by a rocking pedal, which is peculiar to Matchless motor cycles, while the excellent internal-expanding brake is controlled by two pedals conveniently placed one on each of the two spacious and comfortable footboards. In our opinion, it would be very much better to separate these two pedals, and arrange for the near side one to withdraw the clutch. The clutch is smooth in action and requires no effort, and, being indestructible, can be freely used.

A very comfortable 175 Brooks saddle is fitted, the forward end of which is linked to the top tube, while the rear end is suspended on coil springs, the lower ends of which are attached to the frame.

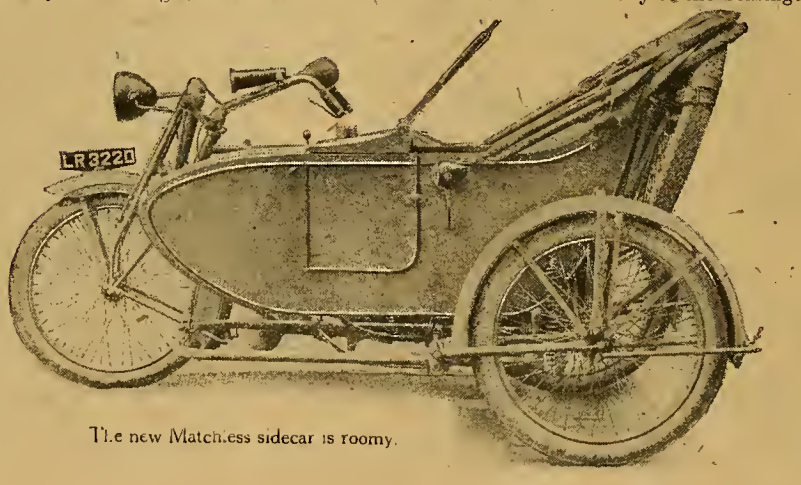
It is almost unnecessary to say that the sidecar wheel is also sprung, and that a coil spring is employed. The wheel is carried in horizontal forks hinged at both ends, while lubricators are supplied to all moving parts.

The front forks follow Messrs. Collier and Sons' usual design, but are improved by the fitting of adjusting nuts for taking up any side-play which may develop through wear.

A Lucas combined magneto and dynamo is fitted, and we can say from experience that it works excellently in its dual capacity. We took the machine for its first drive in the dark, and the lamps gave a splendid light. The controlling switch, however, is not very conveniently placed. It is quite easy to reach, but is attached to the inside of the tank in just the position where the rider's knees grip.

On the whole, however, we are immensely pleased with the latest Matchless production, which is the result of the labours of two practical motor cyclists.

We hope to say more about our road experiences with this superb outfit at an early date; but the short drive in the dark to which we have referred gave us an excellent idea of its springing, flexibility, and speed.



The new Matchless sidecar is roomy.

A NOVICES' TRIAL IN THE MIDLANDS.

Successful Event organised by Motor Cycle Firm for Employees.

ON Saturday last the Humber Co., Coventry, held the first of what may be many trials organised by large manufacturers to encourage their workmen to become motor cyclists and to foster goodwill between employer and employee. Such events should have far-reaching effects, for they bring the men, who actually make motor cycles, into direct touch with the conditions under which they are developed.

We commend the excellent idea to other large employers of labour, and such events need not be confined to manufacturers of motor cycles.

The organisers of the Humber trial, three of them (Messrs. M. Anderson, J. F. Crimdall, and S. Wright) old competition riders themselves, took into full consideration the fact that the majority of the entrants were absolute novices, hence nothing in the nature of freak hills or other strenuous tests were imposed. Although the stopping and restarting test on Edge Hill may have been considered a trying manœuvre by some of the novices.

The start of the Humber staff trial on Saturday last. Mr. Alec Ross sending away the first of the sixty competitors.

Sixty Competitors.

Fifty motor cycles and ten cars competed, the latter driven by officials of the company, Col. Cole, the managing director, competing on the new 15.9 h.p. model Humber. Of the fifty motor cycles thirty-seven were of Humber make, and included several machines of the old 3½ h.p. single two-speed type, but the majority were all-black 3½ h.p. flat twins. Several other makes were included, however. We noticed a rejuvenated single-cylinder Rex looking very smart in its all-black finish and gold lines, a 1919 3½ h.p. Sunbeam, several Triumphs, countershaft, three-speed hub, and single gear models, and a 3 h.p. Enfield.

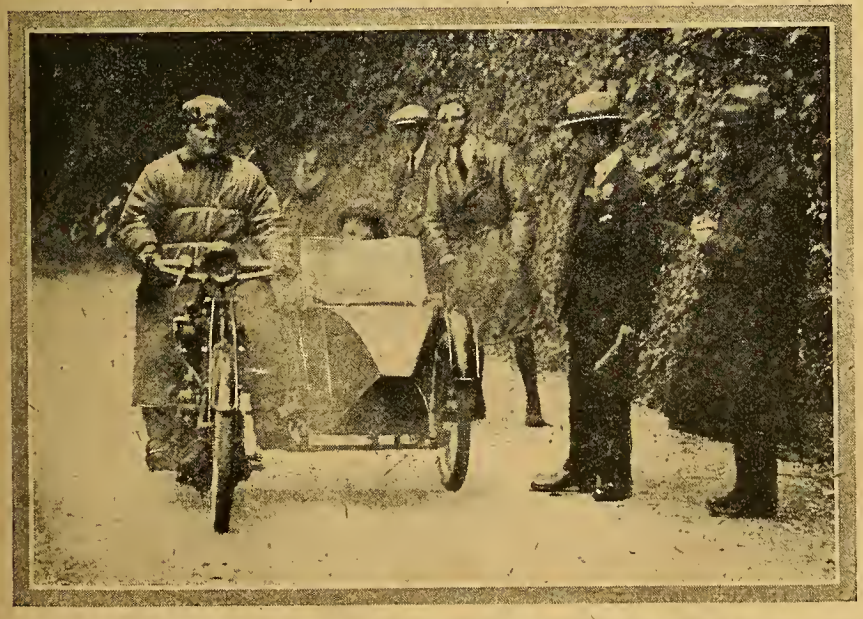
The course was seventy-seven miles in length, and included Edge, Priors Marston, and Newnham Hills. The start and finish were at the Humber works, where the officials were entertained to lunch, Sir Arthur Whitten-Brown, one of the Atlantic flight heroes, also being a guest. The tea stop was at Newnham, to which place the Humber band was sent in a lorry to render musical selections on the village green.

As was to be expected, the majority of the competitors failed, through inexperience, in the stopping and restarting test on Edge Hill, but it was pleasing to see the sporting spirit prevailing among both officials and riders. Among the several excellent restarts we witnessed may be mentioned Sharp, E. V. Gilliatt, and F. C. Brown on 3½ h.p. Humbers, and C. Horsfield on a 6 h.p. water-cooled model. Among the sidecars F. Yates, S. G. King, and W. H. Turner on the 3½ h.p. model, and A. Whittaker on the 6 h.p. Humber all did well.

Several competitors were already out of the trial by the time they reached Edge, but finished the course.

From Edge, the competitors were taken *via* Warmington and Avon Dassett to Priors Marston, where a surprise hill had been included to test the competitors' skill in gear-changing; but the great majority performed quite creditably. A further nine miles brought them to Newnham for 1½ hours interval.

The thirty-mile run to the finishing point commenced with the ascent of Newnham Hill, which most of the solo competitors climbed steadily on middle gear. The riders of older type of single gear machines were among the exceptions, although F. W. Baker, on the modern three-speeder, made a good ascent on his top gear. A. H. Bagley, on a 1912 two-speed single-cylinder Humber, also made a good climb, as did P. White on a slightly more modern machine of the same type.



F. Yates (3½ h.p. Humber sidecar) in the stopping and restarting test.

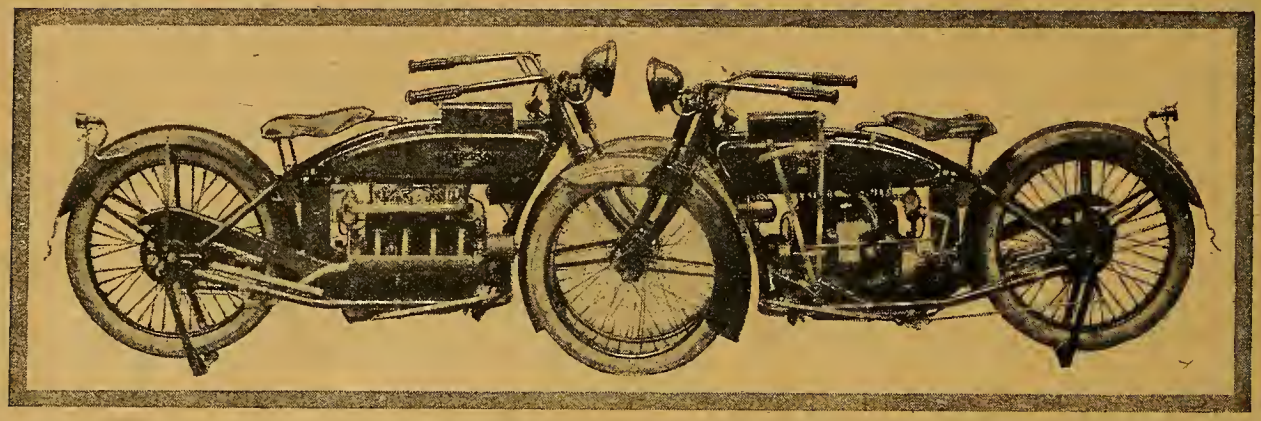
Sidecars on Newnham.

A. Whittaker (6 h.p. Humber sc.) made a fast climb, but J. A. Gill on an old type single-cylinder sidecar decided to relieve the machine of his weight. A. Tutchings, S. G. King, J. Idiens, W. H. Turner, and F. Griffin, all on 3½ h.p. flat twin Humber sidecars, did well, as did A. Edwards on a 4 h.p. Triumph sc.

Altogether it was a good trial, upon which we congratulate Mr. H. L. Davey, the chief organiser. We also congratulate the motor cyclist element of the Humber works for such an excellent entry.

Four-cylinder Motor Cycle Construction.

Some Particulars of the Latest 10 h.p. Henderson.



The model Z2 electrically-equipped Henderson.

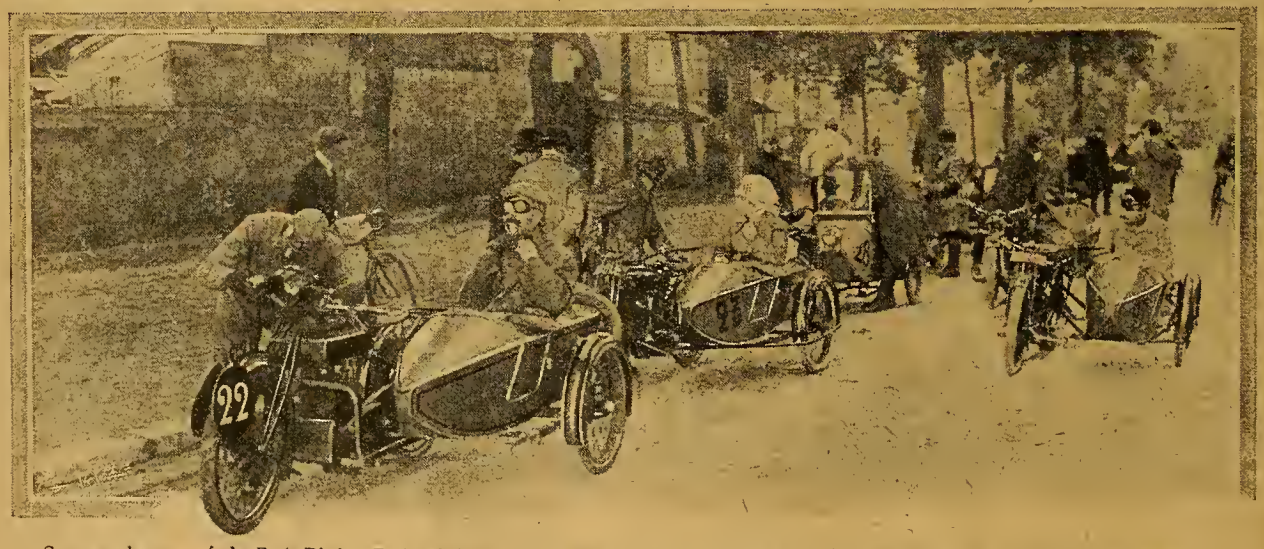
OUR experiences of the four-cylinder Henderson motor bicycle of the 1914 and 1915 models have been so delightful that it was with considerable pleasure that we heard that the first batch of 1919 models had arrived in this country, and were to be seen at Messrs. Robertson's, 157b, Great Portland Street, London, W.1. The Henderson stands almost alone; it is the first real novelty in motor cycle design which has come over from America. It is so fast that when the rider suddenly opens the throttle he has to grip the handle-bars tightly to stop himself from shooting off the back of the saddle, and yet it is so docile that it can be driven with comfort in the thickest London traffic.

Ignition and Lighting.

The new model is of extremely attractive design, being finished in khaki and having little plating work about it. As regards novel details mention must be made of the excellent spring forks, which are provided with a triple crown of immense strength. The Berling ignition system is quite separate from the dynamo lighting set. The former is compact in design, and carries a cut-out switch on the contact breaker cover. The lighting equipment is a direct current dynamo manufactured by the General Electric Co. The dynamo is driven from a timing gearshaft and generates from two to four ampères at 20 to 35 m.p.h. The commutator is mounted on a ½in. shaft running on ball bearings, which can be removed by taking out two screws, and the storage battery is carried in a neat case under the saddle, which can be swung sideways to allow the engine to be removed from the frame without disturbing the electrical equipment or disconnecting the battery switches or wires. The battery is of the well-known Exide pattern. A genuine Klaxon horn and an ammeter complete the equipment.

Most of the detail work is extremely good; for instance, the overhead inlet valve rockers are provided with spring clips, over the lubricators, ensuring adequate lubrication and preventing dust and mud from reaching them through the oil holes.

A much larger flywheel with a multiple-disc clutch built into it running in oil is now fitted, and the three-speed gear box is integral with the crank case. The change-speed gear is provided with an interlocking device, which prevents the lever from being moved until the clutch is disconnected—a very common practice on American motor cycles. The interesting part of the arrangement is that the clutch lever, the longer of the two, when moved farther than is necessary to withdraw the clutch, applies the internal-expanding brake. The clutch can also be operated by a pedal on the left, but this has no effect upon the brake. Another pedal on the right brings the external-contracting rear brake into action. The frame is of great strength, and is provided with substantial lugs for sidecar attachment.



Scene at the start of the Paris-Rheims-Paris reliability trial organised by the Motor Cycle Club of France. British motor cycles figured prominently, carrying off nine of the ten awards in the solo class, the remaining one being taken by an Indian.

M.C. and A.C. Trial.

The name of L. L. Sealey (4¼ B.S.A.) has to be added to the new gold medal winners in the recent M.C. and A.C. Long Day Trial.

Redditch and District M.C.C.

The results of the recent speed trial are as follow :

EXPERT SOLO CLASS.

1. H. Poole (4¼ B.S.A.)
2. L. L. Sealey (3½ B.S.A.)
3. — Bicknell (3 Enfield).

GENERAL SOLO CLASS.

1. W. G. Woodfield (4 James).
2. S. Bright (2¼ Enfield).
3. W. E. Smith (O.K. Junior).

EXPERT SIDECAR CLASS.

1. F. W. Viles (4¼ B.S.A.)
2. J. Doshier (6 Enfield).
3. H. T. Guise (8 Enfield).

GENERAL SIDECAR CLASS.

1. J. Sheppard (6 Enfield sc.)
2. L. George (4¼ B.S.A. sc.)

Fastest times in the solo and sidecar classes were made by H. Poole (4¼ B.S.A.) and F. W. Viles (4¼ B.S.A. sc.) respectively.

North Cheshire M.C.C.

Despite the very unfavourable weather there was a very good attendance at the opening run of the above club. The run to Rudyard was a great success. After tea the sporting members of the club organised a hill-climb, which was won by W. R. Eadington on his 7-9 h.p. Indian. The slow hill-climb also provided much amusement. T. Lawton won this event on a very smart Triumph. The chairman's prize for the smartest turn-out on the run was won by O. E. C. Carter on his well-known A.B.C. There were twenty-seven machines present, which, considering the bad weather, was a very good turn out. The membership of the club is now very large, but there are a few more members to be enrolled yet. Those desirous of membership should communicate with Mr. W. R. Eadington, hon. secretary, London Road, Alderley Edge. Further events will be announced in these columns.

Abersychan and District M.C.C.

This club is now re-formed, and interested motor cyclists in this district who desire to join the club should communicate with Mr. W. Gist, 169, Manor Road, Abersychan, Mon.

The above club recently held a successful speed-judging competition over a distance of seven and a half miles, which had to be covered at an average speed of 15½ m.p.h. The winner proved to be C. Williams (2¾ New Imperial), whose time error was only 15s. Watches and speedometers were not allowed. The second prize winner was G. Oliver, 30s. error; W. Griffin, 45s. error, was third.

A slow hill-climb has been arranged for to-day, Thursday.

The secretary of the club is Mr. Walter Gist, 169, Manor Road, Abersychan, Mon.

Future Events.

July 17.—Abersychon and District M.C.C. Slow Hill-climb.
July 17.—Taunton and District M.C.C. 200 Miles Reliability Trial.
July 19.—Middlesbrough and District M.C.C. Sidecar Competition.
JULY 19.—SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C. OPEN HILL-CLIMB AT STILE COP, NEAR RUGELEY.
JULY 19.—BIRMINGHAM M.C.C. MIDLAND CUP TRIAL.
July 19.—Western M.C.C., Glasgow. Week-end Run to Lake District.
July 19.—Manchester M.C. Hill-climb.
July 19.—Edinburgh and District M.C. Race Meeting at Lonark.
July 19.—N.M.C.F.U., Portsmouth. Run to Hunsdon.
July 19-20.—Cumberland County M.C.C., Carlisle. Reliability Trial to Aberdeen and Back.
July 19-20.—N.M.C.F.U., Coventry. Week-end Run through Wye Valley.
July 19.—Middlesbrough and District M.C.C. Sidecar Competition.
July 20.—Woolwich, Plumstead, and District M.C. Run to Brighton.
July 20.—Rochester, Chatham, and District M.C. Secretary's Surprise Run.
July 20.—N.M.C.F.U., Portsmouth. Run to Corhampton Downs.
July 26.—N.M.C.F.U., Leeds. Run to Beckett's Hospital: Soldiers' Outing.
JULY 21-26.—SCOTTISH SIX DAYS TRIAL.
July 21.—Ilkeston and District M.C.C. Reliability Trial.
July 21.—Rochester, Chatham, and District M.C. Run to Whitstable.
JULY 23.—ESSEX M.C. SPEED TRIALS AT SOUTHEND.
July 23.—N.M.C.F.U., Portsmouth. Run to Blindworth Downs.
July 24.—N.M.C.F.U., Leeds. General Meeting, Green Dragon Hotel.
July 24.—Taunton and District M.C.C. Treasure Hunt.
JULY 25-26.—LIVERPOOL M.C. TWENTY-FOUR HOUR OPEN TRIAL.
JULY 26.—SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C. LIGHTWEIGHT TRIAL FOR CALTHORPE CUP.
July 26.—Western M.C.C., Glasgow. Run to Lake of Monteith.
July 26.—N.M.C.F.U., Portsmouth. Run to Poole Park and New Forest.
July 26.—Public Schools M.C.C. Six Hours Night Reliability Run.
July 26.—N.M.C.F.U., Portsmouth. Run to Warsash.
July 26-27.—Wolverhampton M.C.C. Reliability Trial to Aberystwyth for Stevens Cup.
July 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.
July 27.—Ilkeston and District M.C.C. Run to Malvern.
July 27.—Troedyrhiw and District M.C. Reliability Run.
July 27.—N.M.C.F.U., Leeds. Run to Malton and Castle Howard.
July 27.—Woolwich, Plumstead, and District M.C. Vice-captain's Surprise Run.
July 27.—Birmingham M.C.C. Social Run and Picnic.
July 29.—Rochester, Chatham, and District M.C. Inter-club Meet with Woolwich and Streatham Clubs.
AUG. 4.—YORK AND DISTRICT M.C. OPEN RELIABILITY TRIAL TO EDINBURGH AND BACK.
Aug. 10.—Birmingham M.C.C. Social Run to Monsal Dale.
AUG. 16.—S.E. COUNTIES INTER-TEAM TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL.
Aug. 16-17.—Wolverhampton M.C.C. Reliability Trial to Barmouth for the Eric Williams Shield.
AUG. 23.—BIRMINGHAM M.C.C. OPEN HILL-CLIMB.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 31.—Birmingham M.C.C. Social Run.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
Sept. 6.—Birmingham M.C.C. Reliability Trial for Sangster Cup.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.

Wolverhampton M.C.C.

The results of the reliability trial to Llandrillo are as follow :

1. W. O. Ford (2½ Diamond), 12¼m. error.
2. M. Broatch (4¼ Matchless), 14m. error.
3. Miss Manley (2½ Diamond), 16½m. error.
4. A. Mee (2½ Diamond), 17m. error.
5. H. Taylor (10 Matchless), 19¾m. error.

N.M.C.F.U. (Leeds).

Nearly 200 members have promised to turn out on the 20th inst., when the Leeds branch of the N.M.C.F.U. will give an outing to the wounded soldiers at Beckett's Park Hospital. It is proposed to parade in the centre of the City, and after picking up the guests, to proceed to Harrogate, where tea will be provided. The cost will be borne by each member, and the secretary, Mr. S. W. Lancaster, 7, Evelyn Street, Leeds, will be glad to hear of other Leeds motor cyclists who will help.

Taunton and District M.C.C.

A meet of motor cyclists has been arranged to take place at Wellington Monument on Thursday afternoon, the 24th inst., at which it is hoped all motor cyclists from Somerset and Devon will make an effort to attend. Given fine weather, the view from this elevated position is superb. The Monument is a well-known landmark, and can be reached from Taunton *via* Blagdon or Leigh hills, from Wellington by the direct road or Wrangway, from Hemyock direct, or from Exeter *via* Beambridge and Wrangway or by Culmstock. It is hoped that the Exeter, Sidmouth and Yeovil clubs will be well represented. It is proposed to hold an impromptu hill-climb and other sports.

Leven and East Fife M.C.C.

The results of the open speed trials recently held on St. Andrews Sands are as follows :

CLASS I., NOT EXCEEDING 350 C.C.

1. O. G. Braid (Christie-Jap).
2. J. W. Hewitt (2¾ Douglas).
3. Lt. Jones (2¾ Douglas).

(Ten-mile race.)

CLASS II., 350 C.C. TO 600 C.C.

1. J. W. Adamson (3½ Triumph).
2. Lt. Ronksley (3½ Norton).
3. Capt. Walker (3½ Triumph).

(Six-mile race.)

CLASS IV., 600 C.C. TO 1,000 C.C.

1. G. L. Sawer (American Excelsior).
2. R. J. Braid (Zenith).
3. A. J. Carlow (Zenith).

(Ten-mile race.)

CLASS V., TWO MILE FLYING START.

1. J. W. Adamson (3½ Triumph).
2. Lt. Ronksley (3½ Norton).
3. Capt. Walker (3½ Triumph).

CLASS VI., TWO MILE FLYING START. ANY MACHINE ABOVE 600 C.C., AND NOT EXCEEDING 1,000 C.C.

1. G. L. Sawer (American Excelsior).
2. R. J. Braid (Zenith).

RELAY RACE, SIX MILES.

Leven and East Fife M.C.C. *v.* Crail R.A.F., which was won by the former by A. J. Carlow (Zenith).

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

FINDING A WINNER.

Sir,—I am pleased to learn that the Open Passenger Trial for the Midland Cup on July 19th, organised by the B.M.C.C., is to be run in a manner that will certainly minimise the only objection to a non-stop trial, that is, the possibility of a machine being disqualified owing to tyre trouble—largely a matter of luck, so-called. The course will be divided into sections, each of which will be under observation by patrols, whose duty it will be to investigate each stop. If this be due to a puncture, it will, as far as practicable, be repaired under observation, and the competitor be given a time allowance at the next check. Competition rules permitting stops anywhere; and for any purpose, are a farce so far as reliability trials go, even as it is unfair for the accident of a puncture to cause a machine to be designated unreliable. Brake tests form part of the Midland Cup Trial, but whilst brake tests are useful, the relative retarding effect of the brakes of various machines is not determined by asking competitors merely to stop between tapes: speed of approach to the point of application of brakes and distance required in which to pull up should be taken into account when determining brake efficiency, and a method devised by Mr. Eggington—the club's secretary—appears to do this in a very simple and effective manner.

A hill will be descended with gears in neutral, clutch out, and engine idle. The time of descent over a distance between two tapes will be taken, at the second tape brakes will be applied, and the distance required for the machine to come to a standstill will be measured. (To simplify matters, the road for a short distance past the tape will be spaced out.) The number of feet or yards required for deceleration, added to the time in seconds taken over the free running section, will be the figure of merit, the smallest figure representing the best performance. Not a scientifically perfect test, perhaps, but a step in the right direction.

JAS. L. NORTON.

BRAKE TESTS AND ALT-Y-BADY.

Sir,—In your very excellent report of the M.C. and A.C. trial of June 28th, you mention that the braking test was on the lower portion of the hill. Perhaps it would be well to explain that the objective of the committee in printing the drastic rule, that failures on the brake test would disqualify, was *not* with a view to knocking competitors out, but with the distinct object of impressing upon every competitor the necessity of seeing that his brakes were rather above the average in power and control.

After going down Bache-Canal and Glyn-Ceiriog hills, the competitors would, no doubt, be feeling glad that we had hammered on the brake qualification so emphatically.

Perhaps it *would* have been better to have taken the brake test higher up the hill. As a matter of fact, the official in charge of that section was rather tender-hearted, and wanted to give the competitors as good a chance as possible. He felt, and the committee agree with him, that the original object had been already achieved, and competitors had been driven thoroughly to test and inspect their brakes before starting.

Another point in your report. I am inclined to agree with you that if there is a worse hill in England and Wales than Alt-y-Bady, it must be indeed a bad one.

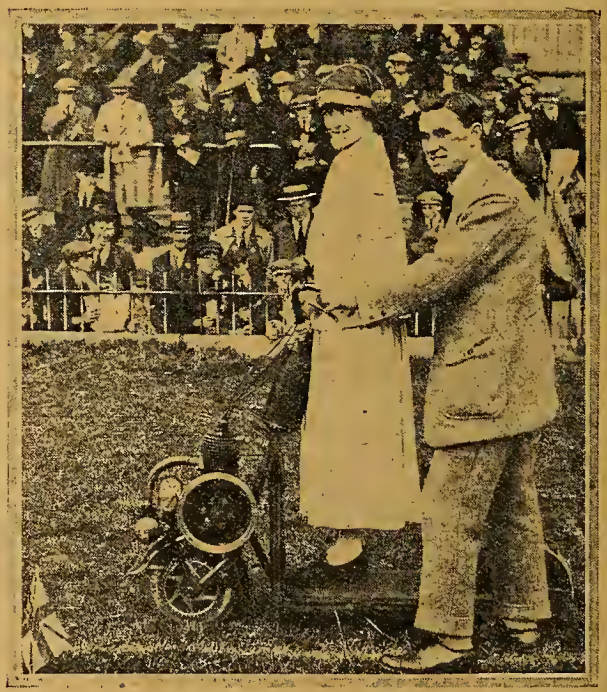
We feel grateful for your frank ruling that the hill was a justifiable inclusion, because it *is* a main road hill, steep as it is. The Michelin Guide-book describes it as "impossible to motors," so the twenty competitors who climbed on June 28th have the gratification of knowing that they have achieved the impossible.

But, in common with many others, you have laid down the dictum that the hill would be unclimbable in wet weather. Strange to say, the surface of this hill is not so affected by wet as one would suppose. The material of the surface is so vastly different from that of, say, Porlock (wet upon Porlock makes deep sticky mire). I have only seen Alt-y-Bady on one wet day, and on that occasion the wet appeared to run off as from a slate roof, streaking away at once in rivulets in the gutters on the extreme side of the road.

As a matter of fact, what, perhaps, was the first climb of this hill, by a motor bicycle, was on a drizzly summer day, seven years ago, in 1912, by a Douglas.

Whilst on this subject, may I respectfully suggest that any motor cyclists, whether as individuals or as clubs in a competition, who should at any time be tempted to try Alt-y-Bady, will show the utmost consideration for the authorities and inhabitants of Llangollen and its neighbourhood? The M.C. and A.C. were on the friendliest terms, and approval of the arrangements was expressed by the police, by members of the local council, and by the inhabitants generally. But any blind rushing up the hill by parties of machines, without marshals and without arrangements for removing the debris, will run the risk of causing trouble, and most particularly should any Sunday attempts be avoided in view of the strict Sabbatarian views of the Welsh people (a point that many English people cannot understand after the more lax observance in their own districts).

FRANK WHITWORTH.



The Autoglider, a new scooter manufactured by Townsend and Co., Birmingham, seen at the charity sports in that city last week.

PROFITEERING.

Sir,—I note with satisfaction in your Correspondence columns in July 3rd issue that at least one firm is taking steps to prevent its agents charging more than the published retail prices of its goods.

Unfortunately, however, as the following experience of mine will show, "there are others."

I was desirous of obtaining a certain sidecar which was stocked by a local agent. Imagine my surprise and disgust when this agent asked five guineas more than the makers' published price for that particular model.

I wrote to the makers about the matter, but although they were "sorry" they could do nothing, not even supply me direct.

Why does such a firm publish the retail prices of its goods at all, when it allows its agents to "profiteer" to this extent? DISGUSTED.

Ipswich.

A RIDER'S DESIGN.

Sir,—The photograph I send is of a sidecar outfit I built myself some time ago. The lamp also is an example of aluminium metal beating, fed by a copper pipe running under the floor of the sidecar to a gas generator. The machine is a 1913 Bat-Jap. I noticed in a recent issue that mention was made of the 1919 big twins, Clyno and Enfield,

A sidecar designed and built by its owner, H. C. Barwick.

etc., running silently at 28 m.p.h. Allow me one word for the Bat-Jap. Mine is a 1913 model with same engine, valves, etc., as were put on the machine, absolutely nothing new since that date. I guarantee that usual conversation is quite easy at 30 m.p.h. There is a lot in *driving* a machine; some drive noisier than others, and on the throttle. I shall be glad if you will insert the letter just to give an impression that quiet running was in "vogue" six years ago.

Norwich. H. C. BARWICK.

PILLION RIDING.

Sir,—I quite agree with "Regular Flying Officer's" views on making the practice of pillion riding illegal. I frequently take a passenger on the carrier of my motor cycle and have never had the slightest difficulty in controlling the machine. I do not think pillion riding is more dangerous than flying. Why not make flying illegal? Perhaps our "windy" town councils will tackle this next.

Personally, I have never seen an accident to a pillion rider, although I have heard of such: but accidents happen to sidecar and solo machines.

One should certainly be more cautious with a passenger on the carrier, and make sure that dresses, etc., cannot be caught in the wheel. QUIRK.

Sleaford.

Sir,—In your issue of July 3rd "Pilot" remarks that the average man "demobbed" certainly will not make use of a sidecar.

I have motor cycled for nine years, and find most people pass through the big-twin-solo-stage, and "Pilot" will find that craze will pass with youth when he is no longer so "full of beans"!

Personally, it seems the rest and comparatively easy handling of a sidecar combination is mostly what will appeal to the average man "demobbed."

By driving and sitting in the sidecar alternately, much ground can be covered by two people with a minimum of fatigue.

Pillion riding is safe for those who really understand what they are about, but of what percentage of present day riders could that be said. PILOT '15—'19.

Edinburgh.

Sir,—I should like to add a word or so to endorse the views, given in a letter signed "A Regular Flying Officer," on the safety of pillion riding. As one of the thousands of ardent motor cyclists who have *not* made a substantial pile out of the war—and who, in these days, cannot afford the £25-£30 now asked for sidecars by the leading makers—I recently took up a pillion passenger as a necessity and experiment; "experiment" no longer, but a joy. There are thousands like me—so pillion riding is now booming—of course, with the attendant critics—people, in the most part, I firmly believe, who speak from absolute lack of practical experience. May I place my experience under three headings?

1. *Danger.*—My wife and self have travelled many hundreds of miles in this way, and I have no hesitation in saying there is no greater element of danger present than in practically any other outdoor sport, whether riding through towns or on the open road. *Careful driving* at all times is the secret, as compared with reckless driving and rank carelessness which are solely responsible for the pillion riding accidents apparently now troubling a few town councils throughout the country, which causes are the characteristics of the majority of fatal accidents on the roads and elsewhere.

2. *Comfort.*—Make up a nice soft seat on a substantial carrier, and, for a young person, where is the discomfort? Also, we have found it much easier to converse with one another in this way than from bicycle to sidecar.

3. *Necessity.*—Sidecar prices swollen from £25 upwards, and indefinite deliveries at that. The price now asked for the solo mount alone leaves the poor middle-class man no balance for the additional cost of a sidecar; and, after all, motor cycle enthusiasts know well the truth of the old maxim, "Two's company."

I trust some of your other readers will give us their real unbiased views on this matter, and let us trust the petitions which a few town councils are thinking of presenting to Parliament on the great "danger" of this pastime will meet with consideration in the hands of some authority who has really studied this matter from experience, and will not condemn such a delightful, joyous pastime, because of a few fatal accidents, caused *solely* by reckless and careless driving. A.R.H.

Portsmouth.

Sir,—I have just read the letter signed "Regular Flying Officer (Pilot)" in your issue of 3rd inst.

While I agree that pillion riding is very convenient when taking a friend to the station, or a partner to the golf course, I am afraid that "R.F.O. (P.)'s" arguments in favour of its continuance are somewhat weak.

Passing over the remarks regarding the "sporting demobbed," high gears, and big twins, your correspondent's statement that he has exceeded 50 m.p.h. with a passenger astern appears to be a very strong argument against the practice. Fortunately, I do not think this sort of thing is common.

Then, does your correspondent suggest that riding on the step of a push bicycle is more dangerous than pillion riding? Surely not!

Personally, I had a serious sidecar accident recently. I have never had an accident when driving with a passenger behind. Therefore, following "R.F.O. (P.)'s" reasoning, sidecaring is more dangerous than pillion riding. As it happens, I know the contrary to be the case.

I believe most motor cyclists will agree that, occasionally, whether owing to carelessness on the part of the "other fellow," or through some other combination of circumstances, even the most careful driver finds himself in a tight corner. Anyone, therefore, who makes a practice of exceeding 50 m.p.h. with a passenger astern, is asking for trouble, with everything in favour of his finding it.

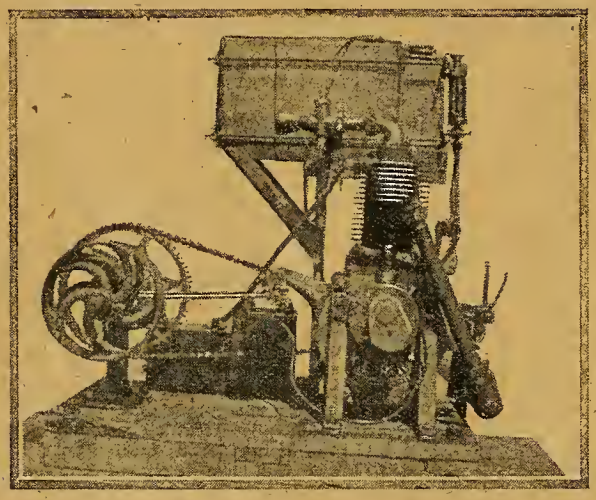
Glasgow. DEMOBBED.

THE ARBUTHNOT TROPHY.

Sir,—May I be permitted to address a few remarks with reference to the Arbuthnot Trophy. Could it not have been possible for the trial to have been open to both officers and men of the Royal Navy? The sight of a sailor astride a motor cycle is not often witnessed I know, but amongst the hundreds of men in the Service there are many who are interested in the pastime, and to whom, I am sure, the event would have greatly appealed. Perhaps it may be found possible for the motor cycle men of the R.N. to compete next time. If so, I myself hope to take part, provided the "exigencies of the Service permit." B.F.C.F.

MOTOR CYCLE ENGINE AS STATIONARY POWER UNIT.

Sir,—Replying to your correspondent "C.E.C." (France), who requests experience of a motor cycle engine used as a source of power for stationary purposes, I have used with success an old air-cooled engine for this purpose.



A ten-year-old 2¼ h.p. Kerry engine used as the power unit to drive lathe and drilling machine. (See letter B. Richardson Billings.)

The power unit drives the various appliances in my workshop. (I would here mention that I am a mere amateur mechanic.) The engine is an old "Kerry" 2¼ h.p., at least ten years old. It drives by means of a cycle chain an intermediate shaft, which carries a fifty-two teeth chain wheel at one end and a 3in. Ford fan pulley at the other. From the latter is taken an inch Balata belt to the overhead countershaft. From this countershaft I can run belts to lathe, drilling machine, and grinder.

The reason why an intermediate shaft was adopted was to reduce the pulley speed, and also to give more facility to alter the gear ratio whenever I wish to.

As it is so geared, it is easily started by pulling on the Balata belt, giving, I should estimate, about ten revolutions to an average pull.

The whole unit is so made as to be self-contained, and is ordinarily bolted to the cement floor of the workshop. But I propose using it occasionally next winter for some pumping that will doubtless have to be done, for, I regret to say, my inspection pit acts as a drain for miles around!

As the machine seems to have an easy load, and is never all out, I have not fitted a fan, but will probably do so later on. There is provision made, if need be, from a small pulley the other side of the chain wheel.

Anyway, the labour spent on this has been much better than that of treadling a lathe.

B. RICHARDSON BILLINGS.

SECOND-HAND PRICES.

Sir,—In your weekly budget of high second-hand prices, it is refreshing to find one man who sets his face against the practice. This is the advertiser who asks anything over £257 for a 1919 Harley-Davidson combination.

The price of the 1919 solo Harley-Davidson is £140 from the Harley-Davidson agents, Newman Street, London. The machine advertised, having done 400 miles, should be worth quite £130 in these times, so in letting the bulbous-backed sidecar go for a mere £127 I think Mr. P. is neglecting his own interests.

I have often wondered at queues in different parts, but I now understand that it must be through people eager to make bargains, such as the above, in these profiteering times.

H. IBBOTSON.

HOT OR COLD INDUCTION?

Sir,—Your contributor, H. J. Poole, Int.B.Sc., does not appear to realise the great difference between his laboratory experiments and the actual working conditions.

In an engine running at 2,000 r.p.m. the vaporisation of the charge, if it is to occur before entering the cylinder, must be completed in $\frac{1}{4000}$th part of a minute.

If Mr. Poole will take into account the latent heat the fuel must absorb in this very short time in order to vaporise, he would probably alter his conclusions, at least in regard to No. 3 petrol.

If it is argued that vaporisation may be completed inside the cylinder, it would, of course, apply equally to paraffin.

M. GLEGHORN.

PRICES AND PRINCIPLE.

Sir,—In reference to the letter from your correspondent "A Buyer" in July 3rd issue of *The Motor Cycle*, we should like to observe that, in the first place, the A.B.C. motor cycle was never offered to the public at any other than its present price, namely, £85.

Speaking for ourselves, we should very much like to make the A.B.C. machine to sell for £70, and only regret that, owing to circumstances outside our control—the aspirations of labour, for instance, and the depreciation of the value of currency—we are unable to do so. At the same time we are perfectly aware that at £70 it would have more purchasers than at £85. Our policy is to set up a new standard in motor cycle excellence, which cannot be pursued by effecting retrenchments either in workmanship or material. We believe that this policy is one with which the bulk of riders are in entire agreement, and we also believe that the majority of them will realise the present-day difficulties in the fixing of a price for a revolutionary new design, especially when it has been adopted with a view to providing a more complete and efficient machine than has ever been produced.

We realise, and sympathise with, "A Buyer's" disappointment. He would, however, hardly have taken the action he did without some sufficient reason, which, we assume, was grounded upon knowledge of the conditions of motor cycle manufacture. Such being the case, we hope he will accept an invitation to come to our works, and thoroughly investigate the manner in which the A.B.C. is made. If he will then indicate any direction in which practical steps can be taken to reduce the selling price of our motor cycle, we shall very gratefully adopt them, and not scruple to accord him the public credit he deserves.

May we remark, in conclusion, that our prices are first, last, and all the time based exclusively upon the cost of labour and material, and are not, nor are they likely to be, influenced by the price of other motor cycles?

We regret to conclude, on carefully reading your correspondent's letter, that, so far as new machines are concerned, he proposes to renounce motor cycling altogether.

"HINTS & TIPS FOR MOTOR CYCLISTS." Full of useful "wrinkles" and little items of sound advice on the management, repair, equipment, and general care of a motor cycle. It will be found invaluable to all those who are thinking of overhauling their machines. *Sixth edition (2nd reprint)*	2/-	2/3

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4. or of leading Booksellers and Railway Bookstalls.

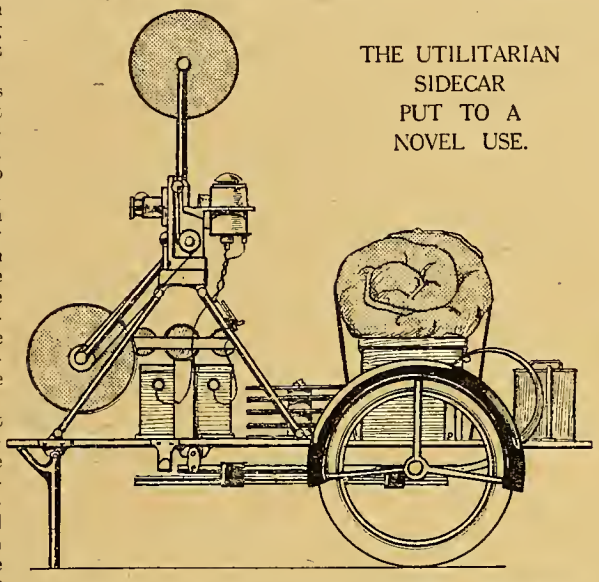
A SIDECAR CINEMA.

THE sidecar has been used for many purposes from mounting machine-guns to moving furniture, but it is not often that one hears of a sidecar travelling cinema. The drawing below depicts the sidecar used by Mr. Harold T. Towner for this purpose during an eight months' "tour" in the summer of 1916 along the banks of the Suez Canal.

The sidecar chassis was of the conventional light type, which had to be reinforced with 2in. × 1in. channel section iron to give it the required stability. The cinema machine was a Baby Gaumont, mounted in such a position that it could be operated from the saddle of the machine, or instantly removed from the machine altogether. Although the cinema machine was quite small, Mr. Towner advises us that it was possible to get a picture about 10ft. square quite easily. The accumulators were mounted beneath the cinema, and suffered very little from the road shocks. These also supplied current for the head light, which served as a "hall light" while the films were being changed. A front stand was found necessary to steady the apparatus when showing, and the back, too, was generally shored with an empty box or timber when procurable. The screen was carried in the operator's kit, and the frame, composed of short rods which fitted together, was strapped to the chassis. The whole outfit was attached to a 1916 B.S.A., chain-cum-belt model, which, our correspondent says, did excellent work, and had to pull the "whole thing" through any amount of sand and over tracks up the sides of hills, and, in some cases, over wire netting laid on the soft sand.

While travelling from camp to camp a linen cover was fitted over the equipment.

THE UTILITARIAN SIDECAR PUT TO A NOVEL USE.



Complete cinema outfit mounted on a chassis. The lamp is 18 volt 3 amp., with a 100 c.p. metallic filament bulb. The film box is shown above the axle and beneath the operator's blanket and kit. Empty spools, rewinding gear, and the 18 volt 80 amp. accumulators are also shown.

No doubt this novel cinema brought many pleasant evenings to those who were on the ever scorching desert defending the frontiers of the Empire.

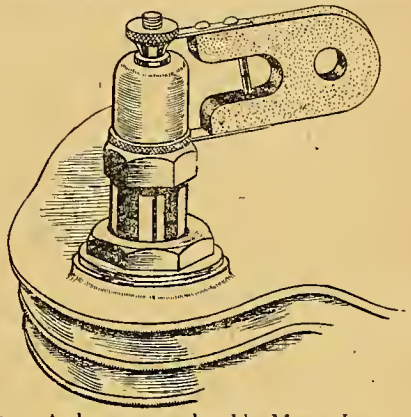
This illustrates how universally the war called in all forms of industrial activity, automobilism not least among them.

MOTOR CYCLES AS A GRANDSTAND.
French soldiers put their Triumphs to a novel use on the arrival of the Plenipotentiaries at Versailles to sign the Peace Treaty.

A NOVEL PLUG TESTER.

CONSIDERABLE inconvenience is frequently caused when applying some kind of tool in order to determine if the cause of a sudden breakdown is due to a faulty plug.

To obviate this practice Messrs. Leo Ripault and Co., 1, King's Road, St. Pancras, London, N.W.1, have produced a simple device, marketed at 2s. 6d., consisting of two flat terminals screwed



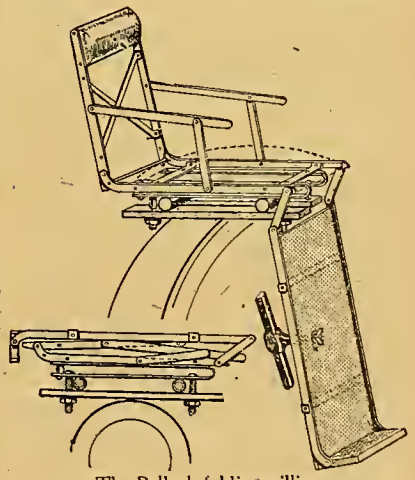
A plug tester marketed by Messrs. Leo Ripault and Co.

to a fibre holder, which, when applied to the plug terminal and any part of its metal body, will, if the plug is functioning correctly, produce a spark between the two electrodes contained in the centre.

A FOLDING PILLION SEAT.

WE have received preliminary details of a useful folding pillion seat which is to be sold by J. H. M. Pollock, 22, Surrey Street, Strand, London, W.C.2.

The seat possesses the advantage of having a comfortable back, and is suspended on a U spring with a spiral spring at the rear. A protected leg rest



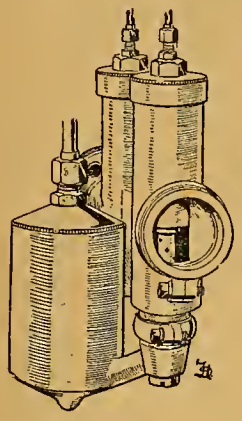
The Pollock folding pillion.

is also fitted, which should be extremely useful in the event of the seat being used by a lady, adequately protecting the dress from the spokes of the rear wheel. When out of use the seat folds neatly away, and the leg rest, folding over the top of the whole, forms a luggage platform.

The Latest Everest Carburetter.

Multiple Jets, Automatic Action. Additional Air Lever Fitted.

HITHERTO the Everest carburetter has been known as an automatic instrument having a single lever. In common, however, with most motor cycle carburetters (even those which are fully automatic in operation), it has been found desirable to provide a means of admitting extra air for temperature compensations as is sometimes necessary on occasion, therefore, while the former attribute remains, a second lever has been added for starting purposes and for the occasional control of the air supply. As before, the jet consists of an upright cylinder having a number of tiny holes in it. These holes used to be placed in a vertical line facing the engine, but it was found that their position with regard to the engine was a matter of small importance, and they are now placed in a spiral at equal distances, so that it does not matter what position the jet takes up when screwed home. This tends to ease in fitting. The holes are bored with a $\frac{1}{16}$in. drill until they are nearly through the cylinder wall, and then finished to measure $\frac{5}{1000}$in. The object of this method of boring is to give a very shallow hole which cannot possibly retain any solid matter and so become choked.



Exterior of the latest pattern Everest automatic carburetter, the jet of which consists of an upright tube pierced with tiny holes.

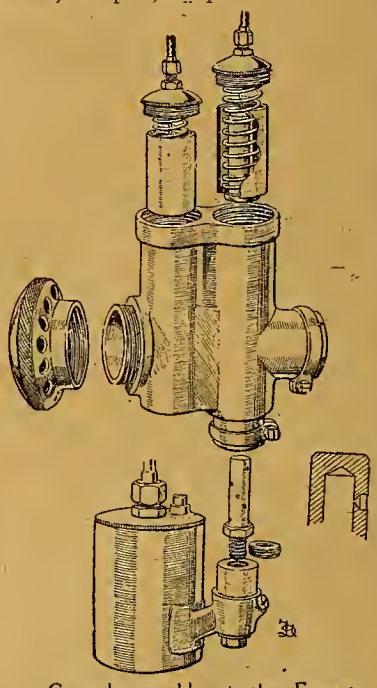
Inside the throttle barrel is a loose sleeve, which covers all the holes when the throttle is closed and opens them one by one as the throttle is raised. As this sleeve is a loose fit, a certain amount of suction is felt by the hole which is next to be uncovered. Thus petrol is drawn from it to a gradually increasing extent as the sleeve rises until the hole is uncovered.

Effective Adjustments.

The inflow of air is straight through the carburetter, but the opening where the throttle works has vertical sides, so that a certain movement of the throttle lever corresponds to practically the same amount of throttle opening whatever may be its position.

Adjustment to suit any particular engine can be carried out by varying the size of the holes, *e.g.*, at small throttle openings they may be reduced to a minimum, and the upper holes enlarged for speed and power. Further adjustment can be made by removing or adding washers below the jet, thus altering the height of the holes so that they come into action sooner or later with reference to the throttle opening, and so vary the strength of the mixture. The air slide works in a separate cylinder. This and all other details of its construction can be plainly seen in the accompanying illustrations.

In use the carburetter is most effective, but we hope to have more to say on this point later. The maker is Mr. E. P. Everest, Newport, Salop.



General assembly of the Everest carburetter, the small inset showing how jet is drilled to prevent clogging.

Standardisation of Chains.

THE unprecedented demands of the Allied Governments for driving chains for all purposes during the period of the war made it necessary for the British driving chain manufacturers to collaborate in order to use the whole of their resources to the best advantage. As a result, the needs were met, both as regards quantity of production and quality of product. The benefits accruing from co-operation were so marked that a permanent association has now been formed.

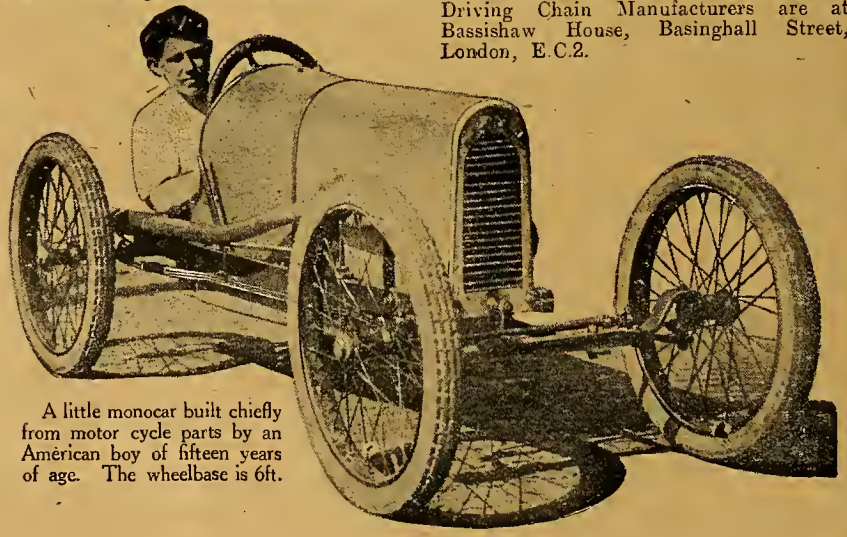
The main object of the association is to foster and develop the use and application of chain gearing. In view of competition with other forms of transmission, it is the policy of the association to keep down the cost of chain driving to the user. This will be attained by:

(1.) Standardisation of chains, wheels, and chain wheel cutters to ensure interchangeability. (2.) Elimination of unnecessary sizes of chains, which have been a source of confusion and difficulty to the user. (3.) The increase in output resulting from the above. (4.) The more comprehensive research made possible by co-operation.

Further, it is confidently anticipated that the policy of the association will enable British driving chain manufacturers and their customers to secure a larger share of Overseas business than hitherto.

The following firms are co-operating: Alfred Appleby Chain Co., Ltd., Tilton Road, Birmingham; Brampton Bros., Ltd., Oliver Street Works, Birmingham; "The Coventry" Chain Co., Ltd., Spon End Works, Coventry; and Hans Renold, Ltd., Didsbury, Manchester.

The offices of the Association of British Driving Chain Manufacturers are at Bassishaw House, Basinghall Street, London, E.C.2.



A little monocar built chiefly from motor cycle parts by an American boy of fifteen years of age. The wheelbase is 6ft.

The Tankette "Scooter" now a Tricar.

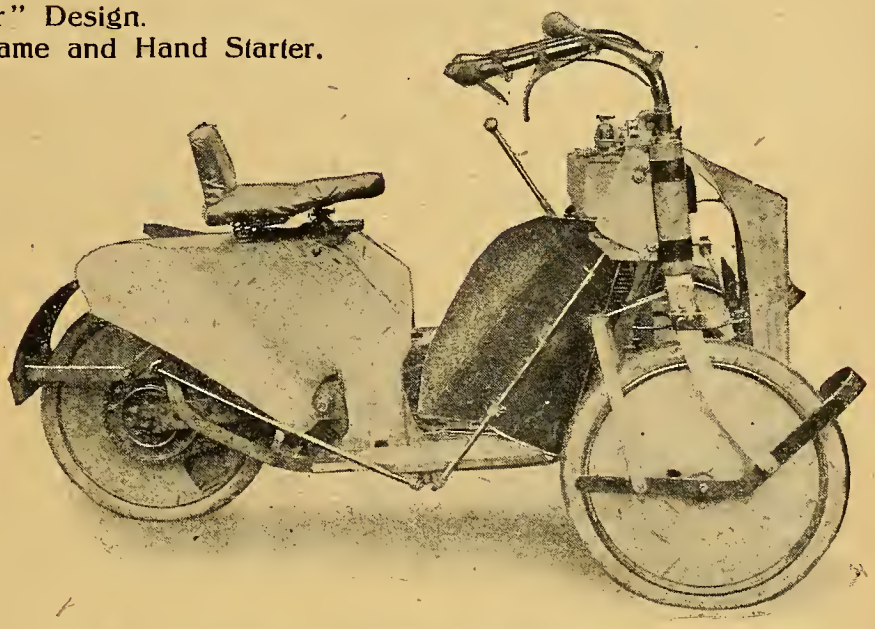
An Ambitious "All-weather" Design. Steel-strip Frame and Hand Starter.

REFERENCE has already been made in these pages to the Tankette, and we were recently enabled to see a rough preliminary model of this extremely unconventional vehicle at the works of Messrs. Ronald Trist and Co., Ltd., 229, High Street, Watford.

The frame is of peculiar design, being built up of mild steel strips bolted together with a cradle for the engine in front.

The forks are of the spring variety, employing laminated springs, but in future models the more conventional type of motor cycle fork will be employed.

The engine is a 2¾ h.p. Union two-stroke (70 mm. × 85 mm.) situated well in front of the frame. The drive is by chain to two cone clutches on the countershaft, thence by two chains to the rear wheel. The disc wheels are 20in. × 2in. The twin rear wheel is carried on quarter-elliptical springs, while radius rods are fitted, enabling the chain length to be kept constant. The hub is provided with a hollow spindle, so that it is easily withdrawable.



Side view of the Tankette. A hand starter is provided, and on future models a hood and screen will be fitted

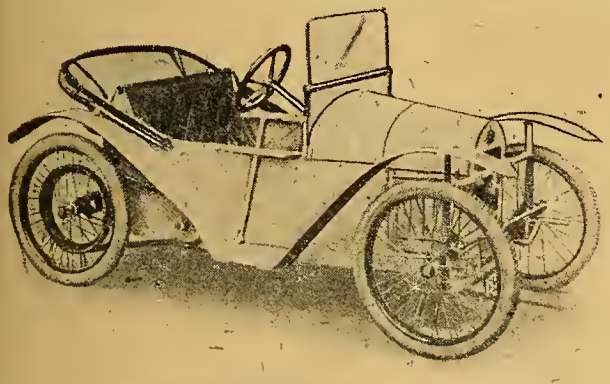
An Experimental Model.

As we have said before, the present Tankette is a rough model, and this accounts for certain crudities in its appearance. We are given to understand, however, that the final model will be considerably improved in many details. For instance, a cylindrical form of petrol tank will be employed, and a hood and screen will be fitted, while the method of mudguarding will be altered for the better.

The vehicle showed itself to be quite a good hill-climber. Its performance up Bushey Hill, near Watford, though slow, was extremely sure, and its behaviour on rough roads quite satisfactory. We drove the machine for a short distance, and found that it steered well at low speeds. Though it can be accelerated to 25 m.p.h., the engine vibration was noticeable after about 17 m.p.h. had been reached, on account of the gear ratio being, of necessity, somewhat low.

The Sicam Runabout.

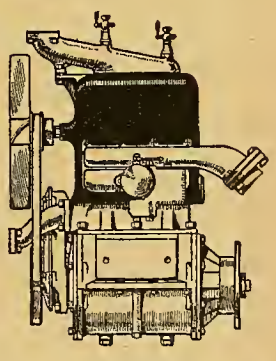
New French Belt-driven Cycle Car with 500 c.c. Two-stroke Engine.



The Sicam runabout manufactured by M. Violet, Paris. It is fitted with vertical twin two-stroke engine.

IT may be remembered that M. Violet, of Pantin, France, competed in the pre-war cycle car Grand Prix on a Violet-Bogey. This designer has now introduced a new vehicle of the runabout type, which is known as the Sicam, and which is fitted with a 7 h.p. two-cylinder two-stroke engine, having cylinders 65 × 75 mm. = 500 c.c. Both air and water-cooled models will be marketed, the former having a fan which forces a draught of air through a tunnel which encloses the cylinders.

A clutch is mounted on the engine-shaft, and the power is transmitted to a transverse countershaft by means of a propeller-shaft and bevel gear. The countershaft carries two variable pulleys. The front suspension is similar to that of the Morgan Runabout, while at the rear a transverse leaf spring is used.



The two-cylinder two-stroke engine used on the Sicam runabout

THE PRICE OF PETROL.

AT a meeting of motorists and others interested in motor transport, held by the Automobile Association at Luton on the 7th inst., a resolution was passed calling on the Government to stimulate the use of the home-produced fuels—power alcohol and benzole—by immediately giving effect to the Departmental Committee's recommendations on the utilisation of power alcohol, and also the Fuel Research Committee's recommendations on gas standards, providing that all gas companies be required to extract the whole of the benzole from their gases.

Mr. Hughes Cumberland, presiding, said that fuels as good as, and infinitely cheaper than petrol could be produced in this country which would not only cause financial benefit, but be of enormous importance otherwise to the motoring industry

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Rising Prices.

I ordered a 3½ h.p. motor cycle some weeks ago. Delivery was promised in July, and I was informed that the price was 95 gns. I received a letter recently stating that the makers had raised the price to 105 gns., and that if I did not want to pay the extra they had another customer who would do so. Am I liable to pay this extra amount?—C.F.

New machines are mostly being sold at prices ruling at time of delivery, and unless you had a definite contract to supply at the lower figure we fear that you will have to pay the increased price if you desire the machine.

Valve Timing.

I recently bought a 3½ h.p. Brown engine, which I fitted into a Rex motor cycle, two-speed frame. This engine has been rebushed and new rings fitted, and compression is good. (1.) On taking the machine on the road a speed of 20 m.p.h. is attained, and this seems the limit. After travelling four miles the machine overheats and comes to a stop. I have oiled freely, and set the points to break, viz., piston on top dead centre two-thirds retarded. (2.) When the crank case was dismantled it was necessary to take off the small timing pinion which drives the valve gear. The shaft carrying this pinion has one key and the pinion two slots set parallel to each other. This allows the pinion to be placed in two positions. (3.) I cannot get the machine to fire in any of the marked positions, and am absolutely beaten with it. (4.) I might add that I have fitted two new springs to the valves, and these seem a little longer than the old ones, but the valves are receiving their correct lift.—G.R.P.

As your timing seems all mixed up, the best thing to do is to retime entirely both valves and ignition. Leave the main pinion on the engine-shaft and remove the other two. Revolve the engine till the piston is about $\frac{1}{16}$in. down the stroke, and replace the exhaust cam so that the exhaust valve has just closed. Replace the inlet valve cam so that the inlet valve is commencing to open, *i.e.*, the valve is very lightly eased off its seat. This is a good average timing, and may require to be adjusted a tooth either way. Then turn the engine-shaft till the piston is about $\frac{1}{16}$in. down the firing stroke, with the lever fully retarded, and the magneto points about to break. Overheating may be caused by too rich a mixture, too high a gear, or an obstructed silencer.

Gear Ratios.

My machine is a 1913 4 h.p. J.A.P. engined Matchless with P. and M. two-speed gear and cane sidecar. The gear ratios at present are 6 to 1 and 8½ to 1. (1.) Do you think these are too high for riding with a passenger in the sidecar and an extra passenger on the pillion? (2.) The engine does not pull as it should. Would the fitting of new valve springs make an appreciable difference? (3.) Would you give me the most suitable valve and ignition timing for passenger work as above, hill-climbing being the most important consideration?—S.H.B.

(1.) The gear ratios seem to be about correct, and certainly not too high. (2.) The fitting of new valve springs would effect an improvement. (3.) The engine should be timed as follows: Valves: Set the exhaust valve to close just after the completion of the exhaust stroke. It will then commence to open when the piston is about one-seventh of the length of the stroke from the bottom of the firing stroke. The inlet should commence to open as the exhaust closes, and remain open for rather more than one complete stroke of the piston, or while the flywheels turn through about 200°. Ignition: Remove the compression tap. Rotate the engine slowly until the piston is within a quarter of an inch of the top of the compression stroke. (This point can be found by inserting a pencil or piece of wire through the compression tap opening.) This is the position the piston should be in when the igniting spark passes, which in turn takes place when the contact breaker points on the magneto just separate. It remains, therefore, to arrange that both these operations synchronise. Loosen the magneto sprocket, which is usually held on to a taper spindle by a threaded screw. Rotate the magneto armature in its proper direction until the contact points just separate. Take note that the piston is still in its proper position. Now fix the sprocket tightly, taking care not to move the armature in doing so, and again verify the position. In the case of magnetos which give a variable point for ignition, the lever should be set in the fully advanced position prior to timing.

The trophy presented by the Palmer Tyre Ltd., which was competed for in the Irish End-to-end Reliability Run on the 14th and 15th inst

Carburetter Extension Pipe.

(1.) I have a 1919 Triumph. I am told that if the cap on the carburetter air port is cut off, and a piece of metal tubing (or funnel) is fastened on instead, it increases the suction, and hence gives better m.p.g. and higher speed. Do you recommend this? (2.) Where can I buy petrol in bulk (not cans), so as to get it cheaper?—J.C.

(1.) An increase in speed as a result of fitting an extension to the air port of the carburetter is problematical, but no doubt some slight improvement in petrol consumption will result. (2.) Unless you are a large consumer and have special facilities for storage, we cannot recommend the purchase of petrol in bulk.

A Loose Ball Bearing.

I have the same gear box trouble as "Ixion's" correspondents (in *The Motor Cycle* of May 8th, page 457)—a ball race loose in its housing. Will you please let me know (1) whether it is safe to use the machine at all while this is loose? Is it possible for the race to leave its housing altogether and foul with the gear box mechanism (in which case the danger would be very real, of course)? (2.) Please tell me exactly how to "tin the outside" of the ball race, as "Ixion" suggests. I have no tinning plant. The machine is a James 4¼ h.p single three-speed.—A.L.M.

(1.) You had better secure the ball bearing as soon as possible, as it might cause trouble, though this is not very likely. (2.) If the ball bearing is free on the shaft it is easy to take it up in the housing with a thin sheet of paper, which should wedge it in position quite satisfactorily. We expect he means to run a little solder on the outside of the ball race, so as to increase the thickness thereof, and wedge it more securely in the housing, but the method we have suggested should be good enough.

Use of Benzole.

I am expecting delivery of a 8 h.p. Campion-Jap in a few days, and, as I am to use the turnout for pleasure, I do not wish to spoil the appearance for a few coppers saving on the running expenses. (1.) Will the use of benzole mixture (half petrol, half benzole, which, I suppose, improves the running) injure the appearance of the enamel if splashed on to the tank, etc.? (2.) Best plugs to carry for spares for the above machine? (3.) How long will the F.R.S. battery last with three lights burning; also, after newly charging, without lighting? (4.) One charge of oil to start, how far to travel with heavy or light load before oiling again? (5.) Will benzole mixture injure the inside of the tank or any other working parts of machine? (6.) The best insurance company that will insure against accidents, damages, fire, burglary; also to include the A.A. and the M.U.—G.V.F.

(1.) The benzole mixture is very satisfactory, but will attack the enamel if carelessly splashed about. (2.) Any plugs of first-class manufacture will be satisfactory on your machine. (3.) If you are speaking of an accumulator, the lighting duration will depend upon its capacity and the lamps used. The outfits normally supplied give about ten hours' light. Accumulators, when not in use, should be regularly recharged about every six weeks. (4.) One charge of oil every six or eight miles according to load and speed. If engine smokes continuously, cut down oil supply slightly. (5.) Benzole will not injure the tank internally. (6.) If you desire your insurance to include A.A. and M.U. membership, write to the secretary, 21, Fanum House, Whitcombe Street, London, W.C.2.

Army Huts as Garages.

From time to time in your paper there are advertisements for the sale of wooden huts, to be used as motor garages. One of these I have ordered—general Army hut, 40ft. × 20ft., with the alteration of double doors at one end, suitable for holding four light cars or taxis, and to be situated on the main road 4ft. from the wall alongside footpath, and at least 40ft. to 50ft. from any surrounding property. On submitting my plans at the Borough Surveyor's Office, Town Hall, Bradford, for permission to erect this, I am informed that such cannot be used as a motor garage unless it be lined both inside and outside with asbestos and also has a concrete floor, the cost of which would be as much as, if not more than, a proper brick building. Can the vendors claim anything from me, or should they refund my money in full, delivery not being promised for about another week or more?—C.S.

Our legal adviser writes as follows: "I understand that, strictly speaking, a council is not bound to allow a hut to be used for garage purposes. If, however, a council does allow it to be used it can insist on such alterations as it thinks proper, and no doubt these would vary somewhat throughout the country. In some instances, it might be regarded as sufficient to have asbestos outside the hut, while in others both inside and outside would be insisted on. I am informed that, in the case of a hut similar to that described by your correspondent, and to be utilised for four cars or taxis, it would be very advisable to have asbestos both inside and out as well as a concrete floor, and these stipulations could not be regarded as unreasonable. I presume asbestos is required on the outside because there is no brickwork. Probably corrugated iron would be sufficient, but that would be expensive and more difficult to obtain. Your correspondent has no power to cancel the order, and the vendors can either send on the hut or they can resell it and deduct any deficiency in price and let your correspondent have the balance. I do not think that delay in delivery for a few days would make any difference unless immediate delivery was stipulated for."

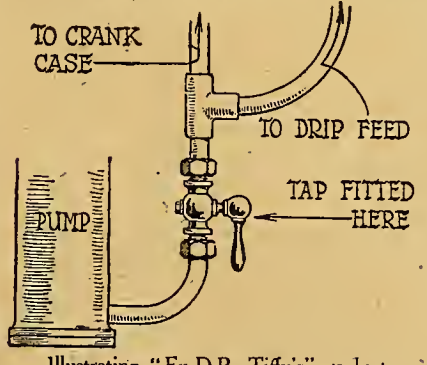
READERS' REPLIES.

Loss of Compression.

Having just read "G.J.B.'s" letter in your issue of July 3rd *re* loss of compression on his Douglas, I may state that, on first possessing one, I was mystified by the hiss of escaping air he describes. Very soon, however, my natural (or unnatural) curiosity prompted me to seek its cause. I find that the lubrication of the valve operating gear is effected by an oilway drilled in centre of mainshaft pinion, through which oil is blown by crank case compression as the pistons "descend." When turning flywheel by hand he can probably hear the air hissing through this oilway, and, if the inspection cover is taken off, it can be felt with the hand.—C.W.F.

Lubrication.

Several readers who complain of excessive oil consumption troubles may find help in the following remedy, which I have carried out and found very successful to more than one 4 h.p. W.D. Douglas: Between pump and branch union (to drip feed and crank case supply) place an ordinary petrol tap, so that in its *on* position it faces down (to obviate



Illustrating "Ex-D.R. Tiffy's" reply to L. W.'s query on the lubrication of a 4 h.p. Douglas.

closing with vibration). By this method it will be seen that the supply can be regulated very easily, and when correct lubrication is obtained, can be fixed if desired, or even, by fitting a lever (foot operated), can be varied according to load.—Ex D.R. TIFFY.

Magneto Ignition.

I notice H. E. Porter says, in reply to a correspondent who has trouble with a low-tension magneto fitted to an N.S.U., that the glazing of the carbon brush is part of the trouble. I always understood that the glazing of all carbon brushes on a magneto machine was had and that the surface should not be allowed to become too much glazed. Then I attended a paper read at the Coventry Technical Institute by Mr. A. P. Young, A.M.I.E.E., and an expert technical manager at the B.T.H. Co., Coventry, who said that the glaze on a carbon brush did not affect the correct functioning of the magneto machine. No explanation of the reason was, so far as I recollect, given for this, but Mr. Young, I know, upset one of two more cherished theories in the same paper; one being the opinion that a loud "snappy" spark meant a more effective one for exploding the charge. He proved, by actual experiment at the lecture table, that a very "crackly" spark could be produced by a very low voltage machine, and that the most effective magneto spark could be, and was, practically noiseless—the degree of heat is the thing, not the volume of sound.—B.S.A.

RECOMMENDED ROUTES.

LIVERPOOL TO NORWICH.—G.W.

Liverpool, Widnes, Northwich, Congleton, Leek, Ashbourne, Derby, Nottingham, Grantham, Donington, Long Sutton, Kings Lynn, Swaffham, Dereham, Norwich. Approximately 140 miles.

CHELTENHAM TO MIDDLESBROUGH.—C.H.

Cheltenham, Winchcomb, Broadway, Stratford-on-Avon, Warwick, Hinckley, Ibstock, Cole Orton, Castle Donington, Nottingham, Mansfield, Worksop, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Topcliffe, Thirsk, Stokesley, Middlesbrough.

LONDON TO TORQUAY.—H.B.

London, Kingston, Esher, Cobham, Ripley, Guildford, Hog's Back, Farnham, Alton, Alresford, Winchester, Romsey, Wimborne, Bere Regis, Dorchester, Bridport, Lyme Regis, Charmouth, Colyford, Exeter, Chudleigh, Kingsteignton, Torquay.

BENWICK (NEAR MARCH) TO WESTON-SUPER-MARE.—A.R.A.

Benwick, Ramsey, Huntingdon, Spaldwick, Higham Ferrers, Wellingborough, Northampton, Canons Ashby, Banbury, Chipping Norton, Burford, Cirencester, Tetbury, Bristol, Long Ashton, Congresbury, Weston-super-Mare. Approximately 185 miles.

WESTON-SUPER-MARE TO BENWICK (NEAR MARCH), VIA GLOUCESTER, SHREWSBURY, AND BIRMINGHAM.—A.R.A.

Back to Bristol, Thornbury, Hardwick, Gloucester, Worcester, Kidderminster, Bridgnorth, Shrewsbury. To reach Birmingham, go through Bridgnorth, Stourbridge, Halesowen, Birmingham, continuing through Coventry, Rugby, Market Harborough, Kettering, Thrapston, Huntingdon, Ramsey, Benwick. Approximately 580 miles.

Following Famous Brother.

Percy Newman, who made his *début* in competitions in the M.C. and A.C. "Long Day" Trial on an Ivy, is a brother of Howard C. Newman, the well-known Precision exponent before the war.

Extensions.

We learn that the Owen Davies Engineering Co., Ltd., is extending its motor body building, sidecar, and sheet metal departments, having moved into larger premises at Ballards Lane, near Tally Ho Corner, North Finchley, London, N.12.

The £100 Runabout.

The three-wheeled and four-wheeled runabouts, which will shortly be offered to the public by the Beaufort Motor Agency, of Bristol, will not be known as the Aero-car, as has been announced. This name is the property of the Aero Car Engineering Co., and a new title will be found for the Bristol production.

Catalogues Received.

Messrs. Tuck and Blakemore, Coventry. A comprehensive list of tools suitable for motor work and adjustment.

Messrs. Leo Ripault and Co., 1, King's Road, St. Pancras, London N.W.1, have issued a descriptive list illustrating their various types of Oleo plugs.

The Vowels Engineering Co., of Mount Street, Coventry, has issued a booklet concerning the Warner spring frame attachment, by which rigid machines can be converted into spring frame mounts.

A neat and very useful booklet has just been issued by the makers of the Dalm engine dealing with running instructions. The book also contains a revised list of spare parts. Owners of Dalm engines should write for a copy from Messrs. J. C. Dalman and Sons, River Street, Birmingham.

We have received a copy of the latest catalogue published by the Etablissements Hutchinson, 70, Basinghall Street, London, E.C., which includes a useful table showing the types of Hutchinson tyres recommended for various makes of machines. Advice is given for solo machines up to 350 c.c., and for passenger and solo machines up to 500 c.c., 750 c.c., and 1,000 c.c. Special mention is made of the three-ribbed pattern Hutchinson tyre for motor cycles fitted with voiturette rims and for light cars.

Air Force Cross for Competition Rider.

Lt. J. L. Stocks, late of the R.A.F., the travelling representative for the Ariel Co. and a keen competition rider, has been awarded the Air Force Cross for distinguished services rendered during the war.

The New Home of the B.L.I.C. Magneto.

The British Lighting and Ignition Co., Limited, who, during the war were established at 204, Tottenham Court Road, London, W.1, have now removed their head office and works to Cheston Road, Aston, Birmingham, and will in future be known as the B.L.I.C. Works.

Direct Factory Representatives Overseas.

We have frequently referred to the necessity for motor cycle manufacturers to be directly represented Overseas, and several firms are now making arrangements on these lines. The Clyno Co. has appointed Capt. B. C. Woodward (who has contributed articles on Overseas trade to *The Motor Cycle*) to be their resident factory representative in South Africa, and his temporary address is P.O., Box 124, Germiston, Transvaal. The Clyno Co. has also appointed representatives covering Scandinavia, Holland and Belgium, and the Indian Empire, and are endeavouring to find suitable representatives to act in a like capacity in Australia and Southern America. This is indeed a step in the right direction.

Change of Name

Messrs. Alfred Wiseman, Ltd., Glover Street, Birmingham, inform us that the motor cycle manufactured by them is to be known as the Verus, and not the Sirrah Verus, as has been mentioned.

Aero Plugs for Motor Cyclists

Capt. Gathergood, the winner of the Aerial Derby, used K.L.G. plugs, as did the second and third prize winners, and also Capt. Sir John Alcock in his Transatlantic flight.

A London Repair Shop.

Vivian Hardie and Lane, Ltd., the London agents for the Douglas, have opened a well equipped repair shop for the repair and maintenance of Douglas machines.

Reviews.

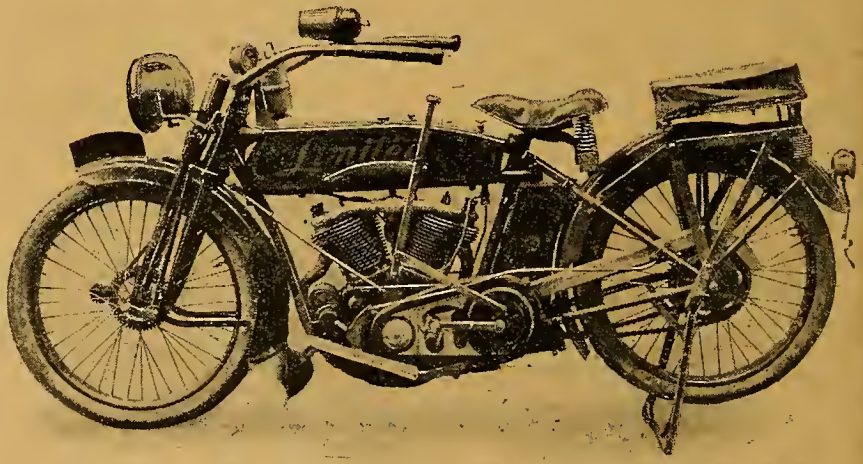
Touring Atlas of the British Isles: J. G. Bartholomew, F.R.G.S., John Bartholomew and Co., The Geographical Institute, Duncan Street, Edinburgh. 2s. 6d. net. This convenient pocket size touring atlas is divided into eighty-nine sections, one of which is printed in contour colours on each double page. First, second, and third-class roads are represented by suitable conventional lines. One hundred selected routes are given at the end of this book, with distances from the starting point recorded in miles. The highest points of the road and of some selected towns in the British Isles are to be found at the beginning of the book, the colouring of which corresponds to that of the contour colouring in the section maps of the atlas.

Gasoline and Kerosene Carburetters: V. H. Page, M.S.A.E., The N.W. Henley Publishing Company of New York, and Crosby Lockwood and Son, 7, Stationers' Hall Court, Ludgate Hill, London, E.C.4, in the United Kingdom. The principles of carburation are thoroughly dealt with; numerous illustrations portray the construction and mechanism of the principal American and British carburetters. The undeveloped subject of the use of the heavier grade petrol or "kerosene" forms an instructive chapter, and supplies both practical and theoretical information.

AMERICAN DESIGN.

WHILE at Wauchope's the other day we came across an American motor cycle which is quite unknown in this country. It is known as the Limited, and is manufactured by the Felbach Motor Co., of Milwaukee, Wisconsin. The particular model is stated to have been used by the Milwaukee police.

In general appearance the machine is exceptionally American. It is fitted with a Schebler carburetter, neatly stowed away between the two cylinders, has overhead mechanically operated inlet valves, and a camshaft for each pair of valves. The raising of the exhaust for the purpose of releasing the engine compression is effected by a rotating camshaft through the twist handle and rod control. The machine is fitted with pedals, which are used for starting the engine. No details of this machine are available at the present time in this country.



The Limited big twin, an American machine at present very little known in this country.

Peace Motoring

Peace of Mind follows A.A. Membership.

It signifies protection—freedom. It is the Key to the Open Road, unlocking the barriers to pleasure motoring.

A.A. membership gives you peace of mind on the road. The great Army of Road Scouts is always at your command to render every possible assistance.

A.A. Roadside Telephone Service is available day and night, ridding you of the fear of getting stranded or losing touch with home or business.

A.A. Free Legal Defence takes a load off your mind should you be threatened with proceedings under the Motor Car Act.

A.A. Hotels relieve you of the anxiety of finding satisfactory accommodation when touring.

A.A. Engineering Department takes from you the fear of buying a faked second-hand car.

In fact, in a hundred and one ways, A.A. membership relieves you of motoring worries.

Join the A.A. now and motor in peace.

Write to-day for a free copy of "The Key to the Open Road" and learn for yourself the advantages which follow A.A. membership.

Applications should be addressed to the Secretary, A.A. & M.U.,
21, Fanum House, Whitcomb Street, London, W.C.2.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., & Co. and crossed. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box ooo, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. ooo, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged; when under £10, the fee is 1s. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

Proof!
Here is further unsolicited "proof" of how we satisfy our clients—just a few extracts taken at random from the many testimonials we have recently received:
"I must take this opportunity of informing you how well satisfied I am with the machine, as I have done over 2,700 miles without five minutes, engine trouble, which I think is a credit to you, and shows the very efficient manner in which you look after your customers."
"The machine ran very nicely, and did not give the slightest trouble. Thanking you for the straightforward business-like way in which you treated me."
"Just a line to say that the 3½ h.p. Motor Cycle I bought off you second-hand is running well in every respect. I am perfectly satisfied with it, also the straightforward way in which you treated me. Have found every word of yours correct concerning the machine, as I have given it a fair run before writing you."
". . . all the same, your word is sufficient as to the machine's worth—the reputation of Laytons for fair dealing extends beyond Bicester."
"Let me take this opportunity of thanking you for the business-like and courteous way in which you have dealt with me."
"Again thanking you for your straightforward dealing."
And if YOU too would guarantee a thoroughly satisfactory purchase and a service personal, courteous, and reliable, then get in touch with us NOW.
We invite enquiries re A.B.C., Ariel, Blackburne, Enfield, Ivy, New Imperial, Norton, Sparkbrook, and Triumph Motor Cycles, and Hillman, Standard, Singer, and Dawson Light Cars.

The Scottish Trials.

FROM the point of view of the Edinburgh M.C., it was unfortunate that, at the eleventh hour, the "trade" decided to withdraw their entries for the Scottish Trials, as, with only private riders competing, the six days' event now taking place over the famous Scottish test hills is robbed of some of its interest. No doubt the news of the withdrawal of trade support will come as a surprise to many, but, everything considered, it is really only what could be expected in view of the many manufacturing difficulties confronting the trade which require such attention that it is necessary to concentrate solely upon production. The preparation of competition machines diverts energy which, at the present time, can better be devoted to output. Also, several manufacturers have not yet rearranged their affairs and got into full swing in producing their new motor cycles.

It was due to a misunderstanding that several makers entered riders for the Scottish Trials, but, in fairness to their contemporaries, who had not done so because of a long-standing and probably forgotten tacit agreement among manufacturers to recommence post-war competitions with the Six Days' Trials, they withdrew their entries.

The Edinburgh Club did not give much time for the matter to be considered by the trade; in fact, we believe that the entries had been closed before a meeting of members of the Union could be arranged. This took place last week, and, we understand, the feeling was unanimous that the A.C.U. trial in September should be the first event recognised by the trade.

Nevertheless, there is no reason to believe that the Scottish Trial will not be a great success, even with its reduced entry. The trade element, moreover, by no means formed the majority of the entries, and there still remain many first-class riders on representative machines. Unlike any other "big" trial held since the signing of the Armistice, this year's Scottish Six Days' is confined almost entirely to private owners.

Weights in Trials.

LAST week we touched briefly upon the weights of the motor cycles which take part in such trials as the A.C.U. Six Days', and again urged the desirability of publishing weights. We publish elsewhere in this issue the preliminary regulations for the Auto Cycle Union's thirteenth annual Six Days' Reliability Trial, which is to be held on September 15th-20th, with Llandrindod Wells as a centre. From these regulations we gather that minimum weights are to be imposed upon each class—solo and passenger—and the actual weights in each case published. Fixing minimum weights will have a good effect in one direction—it will prevent unduly weak, and consequently dangerous, machines from being entered in an arduous trial, and thus minimise the risk of accident. But does it go far enough? We are inclined to think not. Maximum weights should also be fixed. It is a simple matter to add weight to any machine. The designers' real problem so far as the weight question is concerned, is to combine lightness with strength. The average man does not want a machine which, owing to its excessive weight, combined possibly with small capacity, will show up well in hill-climbs, and might, under the old formula, be regarded as a certain winner. What he wants is a motor cycle in which strength and lightness have received their proper consideration. All machines which nearly approach the A.C.U. minima and get through the trial creditably may be considered to have achieved this ideal, for the weights cannot be called excessive.

Minimum tyre sizes are also fixed, but these are, in our opinion, too low, and we should regard any machine so equipped as being under-tyred, except for racing purposes. We are pleased to note that gear ratios—always interesting—are to be published this year.

An Index to the advertisements in this issue will be found on the page facing the back cover.

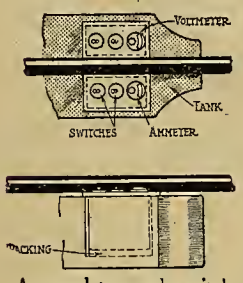
ELECTRIC LIGHTING.

The Suggestion of a Compact Set suitable for a Solo Motor Cycle.

IT is not generally thought that the system of electric lighting at present in use on solo motor cycles will be adopted to any great extent. The objection seems to me to be that motor cycle manufacturers, instead of designing a cheaper and lighter set for motor cycles, have, with few exceptions, adopted the type used on cars, with unfortunate results to their popularity.

The disadvantages of the present type are: (1.) Far too heavy. (2.) Not simple enough for a novice to handle. (3.) Invariably fixed in a dirty position. (4.) Not of a suitable design to enhance the appearance of a machine but rather to detract from it. (5.) Cost.

In the opinion of the writer electric lighting will never be successful until the novice can fix the equipment on with the same amount of ease with which he at present puts on a new horn, and at a price which would enable every two-stroke owner to purchase. Also manufacturers are at present fitting a generator which is almost identical in size with that used on a car, not taking into consideration the relative amount of work to be done on a six-lamp car, and, say, a three-lamp combination. Therefore, I would suggest an ideal set which would be as follows:

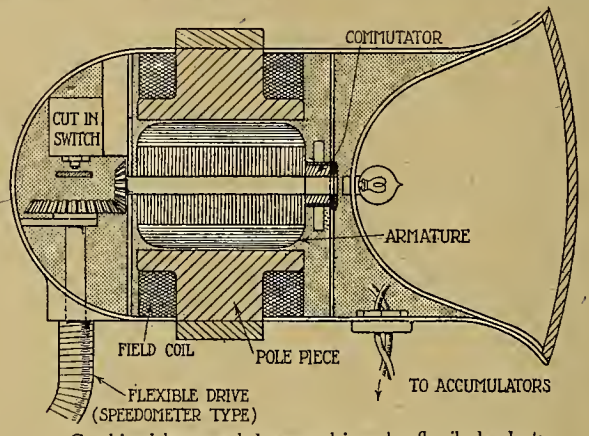


Accumulator and switch box contained in the tank.

GENERATOR.—A generator which I would propose should take the form of a neat head light and generator combined with a drive on the same principle as that of a speedometer, the whole to be mounted on the lamp bracket or handle-bars, and connected to a gear wheel fitted to the hub. Such a generator is shown in the accompanying sketch.

ACCUMULATOR.—The accumulators should be fixed as if these belonged to the machine and were not put on as an afterthought. For a new machine, I would suggest two compartments in the main tank on each side of the frame tube, suitably padded, where a standard battery would fit in a standard sized compartment.

SWITCHBOARD.—The accumulator compartment would be fitted with two neat covering lids, carrying all switches and a small ammeter and voltmeter. In this position the switch would be easy to observe, and would have ample protection afforded by the frame tube.



Combined lamp and dynamo driven by flexib le shaft.

WIRING, ETC.—The beauty of the machine depends to a large extent on its clean, clear cut lines, and its freedom from projecting pieces of wire, cable, etc. I would suggest, therefore, that wherever possible the wiring should run through the frame tubes, and where this is not feasible it should be brass armoured wire, which looks well.

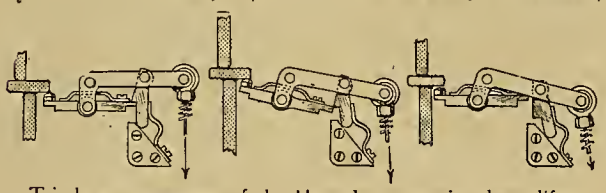
R. BAKER WHITTICK, LT. R.A.F.

KICK-START OPERATED VALVE LIFTER.

A Device to Facilitate Starting, and to Reduce the Handle-bar Equipment by One Lever.

THE modern three and four-speed machine, being no longer dependent on the exhaust valve lifter as a means of control and merely requiring the device to facilitate starting, has introduced a distinct tendency on the part of designers so to arrange the valve lifter that it is operated by the initial movement of the kick-starter pedal.

Such a mechanism is now before us in the design patented by G. C. Alexander, 27, Cranbourne Avenue, Birkenhead,



Trip lever arrangement of the Alexander automatic exhaust lifter.

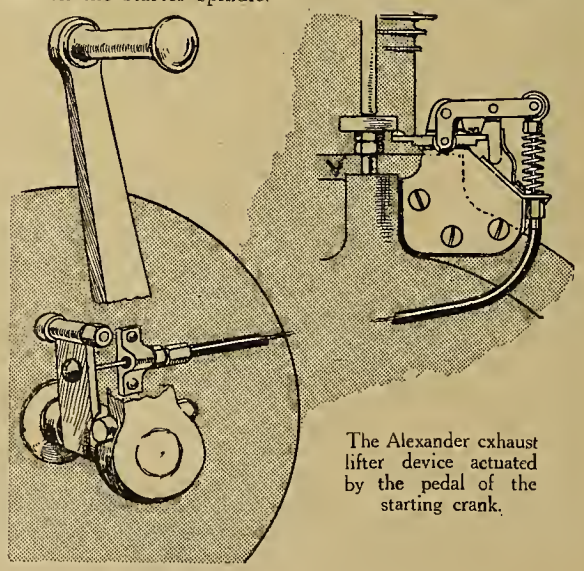
who has adopted an ingenious trip lever to secure the necessary quick drop of the exhaust valve at the correct moment.

A lever, pivoted on the gear box, operates the Bowden wire of the valve lifter through the action of a cam formed by milling a flat on the starter-pedal spindle.

The lifting device proper consists of a bell crank lever pivoted on a plate attached to the crank case; the shorter end of the lever carries a small rocking arm, one end of which lies under the valve tappet and the other under a catch on a small trip lever also attached to the bell crank.

The same movement which raises the valve also causes the lower end of the trip lever to slide along an inclined plane forming part of the crank case attachment plate, and after the correct length of travel the catch moves past the end of the rocking arm, thus allowing the valve to drop suddenly.

Several alternatives and simplifications are suggested, perhaps the most interesting being a method of operating the Bowden control by means of an eccentric instead of a cam on the starter spindle.



The Alexander exhaust lifter device actuated by the pedal of the starting crank.

Another Unicycle.

ACCORDING to *La Science et La Vie*, a French inventor is busied upon another unicycle. It is equipped with two gyroscopes. One of them revolves horizontally and keeps the machine upright. The other is placed vertically, and can be tilted by the rider for steering purposes. The unfortunate rider is perched in a wicker chair on the top of the single wheel, which is apparently about 3ft. in diameter. The snag on which this ingenious inventor will probably be impaled is the problem of getting an engine of rational size to drive both his gyroscopes at a sufficient speed, and also to propel the machine. If he succeeds in this preliminary detail, he will certainly have to guarantee an oiltight crank case and transmission; for his horizontal gyroscope would distribute any leakages far and wide.

Out with a New 'Bus.

THE other day I had a chance to make extended tests of one of the machines which are as truly modern as the Bolsheviks, and not merely refined reincarnations of our oldest friends. It was all that it has been called, so far as pace and performance were concerned, but two pin-points of my experience underline its intrinsic novelty. For one thing, I kept stalling myself with sooted plugs. I knew the engine was super-cooled, as compared with most of my previous mounts; and eke that there were no plain bearings in its anatomy; technically, it followed that it should run world without end on a smear of oil; but habit is stronger than intellect, and, after wiping up a bevy of friends for speed or mopping up a pet test-hill with the flywheel camouflaged into a grey blur, I could not believe that an invisible and odourless exhaust was O.K. Consequently I fed her with oil, most of which the outraged pistons promptly spat up in green and liquid form on to the plug points. Secondly, the most virile thing about the machine was its acceleration, which I demonstrated frequent and free to sundry enthusiastic spectators for several days. The tread of my back tyre not unnaturally displayed resentment; when you bang open the throttle of a willing engine on a 10 to 1 gear on a 1 in 10 hill with a surface resembling those nice little white chips some mourners sprinkle inside grave kerbs, something has got to slip; and after your cush drive has wound itself up solid, there is not much slip in a chain. Which leads me to wonder whether what we win at the Aunt Sally we spend on the roundabouts: or, being interpreted, what we are in pocket through jettisoning spare belts, punches, fasteners, etc., we are out of pocket in renewing our back covers. I had the impudence to tease Mr. Grahame-White for spreading his ægis over a buckboard which used its back tyre as a clutch; but, gadzooks and oddsboddikins, if we accelerate some of the 1919 machines as they deserve, we shall all be treating our back tyres as cush drives.

Sealed Toolbag Trials.

CLUB secretaries are earnestly discussing the revival of the start-to-finish non-stop principle, demonstrated so successfully in the ride for the Arbuthnot Trophy. I see little sense in the contention that only men of some social standing can be set to ride under such conditions. Black sheep dwell in every fold, as W. S. Gilbert had it, but, as far as that goes, there is no need to depend on the personal honour of the entrants. Any club can easily run a non-stop trial with a mere handful of officials. It is only necessary to

(1.) Observe the awkward corners of the route.
(2.) Seal the toolbags at the start.
(3.) Make the riders empty their pockets at the start.

Machines now show a degree of reliability which should render non-stop trials quite practicable. It should not be very long before the A.C.U. adopts this procedure, though the length of its route and the frequency of garages in a populous district create problems which do not arise in one-day trials over sporting courses. Moreover, the sealed toolbag trial is always extremely instructive. To cite a single illustration, how many forms of o.h.v. can cover 1,000 miles without developing an absurd tappet clearance?

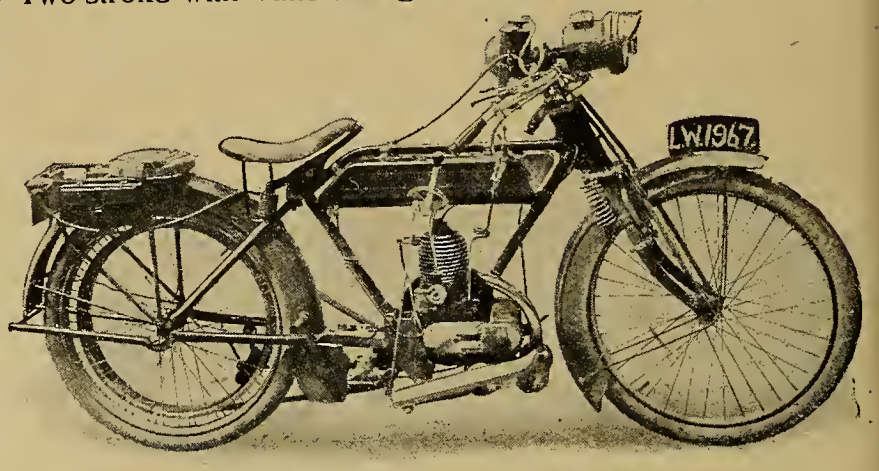
Nemesis.

FATE is just. I curled a scornful lip as I read "Chinook" and "Spring" on the value of adjusting your clutch. Why not, mused I, purchase a decent jigger like my old ——, which is delivered with its clutch in perfect adjustment, and so continues? While ascending one of the 1 in 6 bits with which my vicinity bristles as I thus mused, I became aware that the revs. sounded somewhat excessive for the throttle opening. Two gay calves on the next hairpin distracted me, and the dour mood passed. Next time I travelled that way there was no doubt about it; my favourite old perennial clutch was slipping. Came a wet day, and I threaded one leg under the gear box and the other through the spokes of the back wheel to investigate. Various unpleasant discoveries followed, since the old 'bus has received no more attention than a door-scraper during the great war. By the time I had synchronised the hand and foot controls of the abominable contraption, and made several special tools with which to coax the watch-like intestines of the vital fittings, it became clear that (*a*) the clutch *was* slipping; (*b*) the clutch spring had wilted through age; (*c*) there was no even approximately similar spring within fifty miles; (*d*) packing up the old spring with washers was the only immediate hope; and (*e*) to get at the old spring implied the possession of one of those rubber-neck, triple-universally-jointed box spanners which used to be advertised in the good old days. Having no spare 'bus—— [*Really*, Ixion!—ED.]

A "RUFFELLS" ON THE ROAD.

Strenuous Test of New Two-stroke with Villiers Engine and Burman Gear.

A NEW motor bicycle, unknown to the motor cycle public, came unexpectedly into our hands at Plymouth on the occasion of the Arbuthnot trophy. This is known as the Ruffells, and is sold by the Ruffells Imperial Bioscope Syndicate, Ltd., 8-9, Long Acre, W.C.2. It is fitted with a 2¾ h.p. Villiers engine and a Burman two-speed gear box, incorporating a clutch and kick starter of the type described in *The Motor Cycle* of the 3rd inst. The machine was absolutely brand new and not run in, and to expect it to follow so strenuous a course as that chosen for the Arbuthnot Trophy Trial was asking a great deal.



The Ruffells, the latest newcomer among two-strokes.

On the Steep Hills.

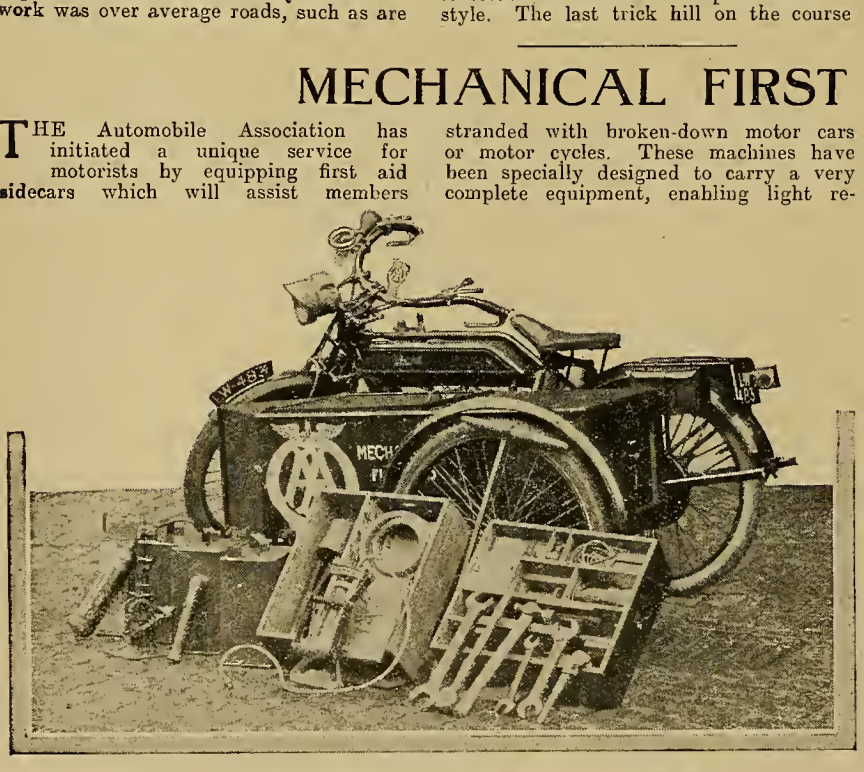
When we left Plymouth on the first day's run the Ruffells suffered very seriously from its new condition, a complaint from which it rapidly recovered after careful driving and plenty of lubricating oil—in fact, it ran better and better every mile, and by the afternoon it ran extremely well. After lunch it was called upon to climb the exceptionally steep and rough ascent between Moretonhampstead and Tedburn St. Mary. This entailed a hairpin corner almost at the very foot, a gradient of 1 in 4 or worse, and an exceptionally loose surface. It failed the first time, but the second time it got up quite well, and the hill near Clifford Bridge, which formed part of the course, was taken in really excellent style.

On the next day the little Ruffells acquitted itself most creditably. Its main work was over average roads, such as are encountered during every-day touring, although the main road hills taken were often extremely long, and such as might be expected to tire an engine pretty severely. The worst task it had to perform during the day was to climb out of Lostwithiel over the old coast road, a straightaway ascent with a good surface, and of considerable length. One could get no run at it, and it had to be climbed on the low gear practically the whole way, and this the machine did very satisfactorily till within a few yards of the top, when, after about three minutes' rest, it restarted and finished up in excellent style. The last trick hill on the course out of Tavistock on to the golf links was taken without a falter.

We cannot speak too highly of the Burman two-speed gear and clutch, which took up the drive smoothly and effectively, and several times restarted the machine on the most appalling gradients. The little engine ran well, and the machine was quite comfortable. The chief criticisms we have to make refer to the smallness of the petrol tank, and the fact that the heel brake pedal is too near the clutch spindle. Otherwise the Ruffells pleased us extremely well, and satisfactorily accomplished the difficult task it was asked to perform.

MECHANICAL FIRST AID.

THE Automobile Association has initiated a unique service for motorists by equipping first aid sidecars which will assist members stranded with broken-down motor cars or motor cycles. These machines have been specially designed to carry a very complete equipment, enabling light repairs to be done "on the road," thereby avoiding the inconvenience and delay involved in towage to garages for repairs or obtaining assistance from distant repairing establishments. In addition to tools, a large assortment of small but important accessories and supplies enable the drivers of these machines, all of whom are competent mechanics, to carry out tyre repairs and to make replacements of faulty connections, wires, etc., causing breakdowns.



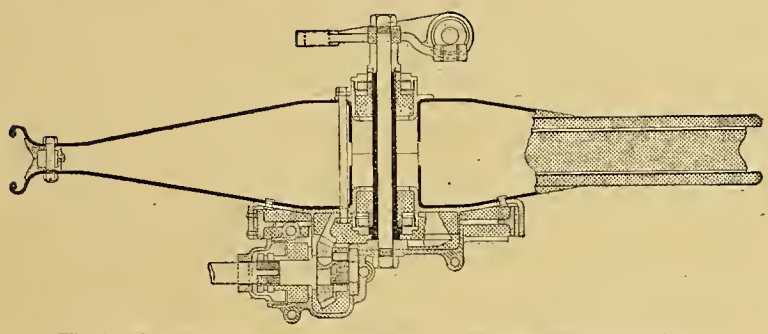
One of the sidecars used by the A.A. to assist members in distress.

The services of these machines and their drivers are entirely free to members of the A.A.

The carrier is divided into two main compartments. The front portion carries the large items, such as petrol, benzole, oil, water, car jack, and the tyre inflator, all ingeniously clipped or strapped in place. At the rear are two drawers divided into small compartments of various dimensions, and fitted with clipped-on covers in which the small articles in the equipment are carefully and compactly arranged to enable the driver-mechanic to find what he requires expeditiously. The side-carriers are painted with the familiar A.A. yellow, and indicate their "mission" to stranded members by the prominent description "Mechanical First Aid," supplemented by a large A.A. badge.

AN UNCONVENTIONAL DESIGN.

Pressed Steel Frame, Rear Springing by Volute Springs, Mechanical Units Enclosed, Shaft Drive, and Opposed Two-stroke Engine with Common Combustion Space.



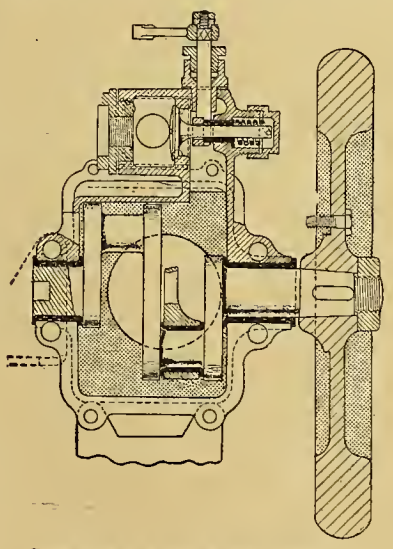
The bevel drive of the shaft transmission. Note the construction of the disc wheel.

THERE have been many attempts on the part of designers of motor cycles to break away from the conventional "diamond" frame, and for some time past there has been a decided tendency for more thought to be given to the great possibilities of pressed steel. Usually, however, such designs have been from the board of more or less pseudo designers who have aimed at the ideal without much regard to the commercial aspect. In addition, we know of several manufacturers who are experimenting with machines which reduce as much as possible the use of steel tubing, as it is thought that pressed steel construction will greatly assist in overcoming several inherent faults of the conventional motor cycle, by enclosing the engine and gear box as in a car, and so removing the possibility of oil reaching the driver. By enclosing the "machinery" it is also possible to produce a machine which can be washed down by a hose, thus reducing the amount of work necessary to keep a machine in first-rate condition.

A Built-up Frame.

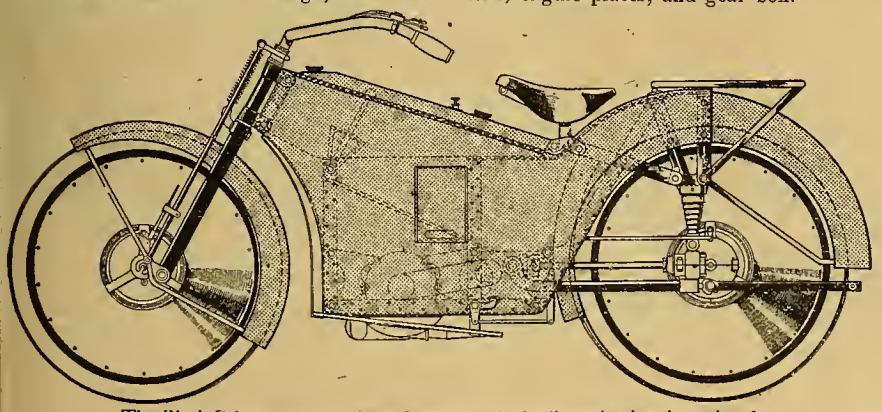
One of the most interesting designs on these lines which we have seen recently is that of the Black Prince motor cycle, which Mr. E. W. Cameron, of Askern, Doncaster, advises us that he hopes to produce shortly as a marketable proposition. The machine, however, departs so much from the conventional that several manufacturing difficulties are likely to be encountered which will tend to retard its production on a large scale without special facilities.

As will be seen from the illustrations, the machine, while unconventional, is by no means "freakish" in design, and when given an "all black" finish, which, we presume, is the intention to be in keeping with the name, the appearance should be quite pleasing. The frame is composed of two side panels of pressed steel connected by means of a sub-frame, the steering head and the tank, which latter becomes part of the frame construction in-



Cross section of the engine, showing the automatic valve for transfer of gas.

stead of an "accessory." Two transverse members pass through the engine plates and hold the frame rigid. These cross members carry an undershield, the crank case, engine plates, and gear box.



The Black Prince motor cycle, a design in which all mechanism is enclosed.

In addition to the ordinary mudguards, there are wide wing pieces at the front of the side panels with a camber forward which induces a draught into the centre part of the machine and should assist in cooling the engine.

The rear springing is quite simple, and should be less expensive to manufacture than the average leaf spring device. The wheel is carried in a substantial fork hinged at its inner end, and volute springs attached at their wider ends to the rear extension of the frame bear upon bosses on the rear ends of the lower stays.

The front wheel springing, too, is simple.

Not the least interesting feature of the design is the type of disc wheel used. As will be observed from the drawing, wire spokes are dispensed with, and in their place two dished discs are used which, with a centre rim piece, form the wheel. Roller bearings carry the wheels, knock-out spindles will be used, and it is intended to fit internal expanding brakes on both hubs.

The steering head is of the usual tubular construction, with two substantial lugs for the bolts, which secure it to the pressed steel members and the tank.

The Transmission.

Following the ideas of many "advance" thinkers, Mr. Cameron has included shaft drive in the specification. The primary transmission is by chain to the gear box, whence the drive is taken by cardan-shaft to the rear wheel through bevel gears.

The centre of the driving member of the gear box coincides with the hinged rear wheel frame. No particulars are yet available regarding the gear box, but we understand that this is to have two speeds, a clutch, and pedal starter.

O.P.T. Engine.

Equally interesting as the framework is the flat twin two-stroke engine, which is the first of a new type which may become to be known as the O.P.T., *i.e.*, one plug twin. This is to say that, although the cylinders are opposed, they have a common combustion space, therefore one plug fires both cylinders with, of course, perfect synchronism, the impulse effect and the mechanical balance being the same as in a four-stroke opposed twin.

By this form of construction long induction pipes are obviated, and as the new gas enters at the centre of the combustion space and exhausts at the bottom of the stroke, a straight through flow is pro-

An Unconventional Design.—

vided, which ensures that no dead gases remain near the sparking plug on the following power stroke.

As will be appreciated, there is considerably more radiating area on the combustion chamber than in any other type of engine, and in an air-cooled engine of the two-stroke type this may be found a very desirable feature. In a water-cooled type, however, it may be found that such an engine would not show up to great advantage, as in all probability it would be over-cooled.

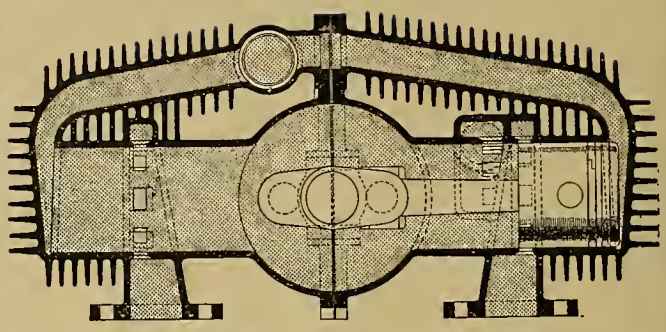
To Eliminate Four-stroking.

From the crank case the new gases enter the combustion space through an automatic valve directly opposite the plug, therefore four-stroking, even at low speeds, should be almost, if not entirely, eliminated.

The overall length of a 60 × 61 mm. engine of this type is only 15½in., and we are informed that 4,000 r.p.m. have been attained.

It is also intended to market a model fitted with a single-cylinder two-stroke engine, and for this model the Union engine, made by Messrs. Josiah Parkes, of Willenhall, may be chosen.

Without doubt the Black Prince is a most interesting design, and at a later date we may be able to record our impressions of its performance on the road. In the meantime we congratulate the designers in producing on paper what is a really serious attempt to attain a machine which so many have prophesied to be the type of the future—a weatherproof motor cycle at a low cost.



An "O.P.T." engine—a flat twin two-stroke with common combustion space.

THE 1919 "P.V."

Pioneer Spring Frame Machine in a New Guise.

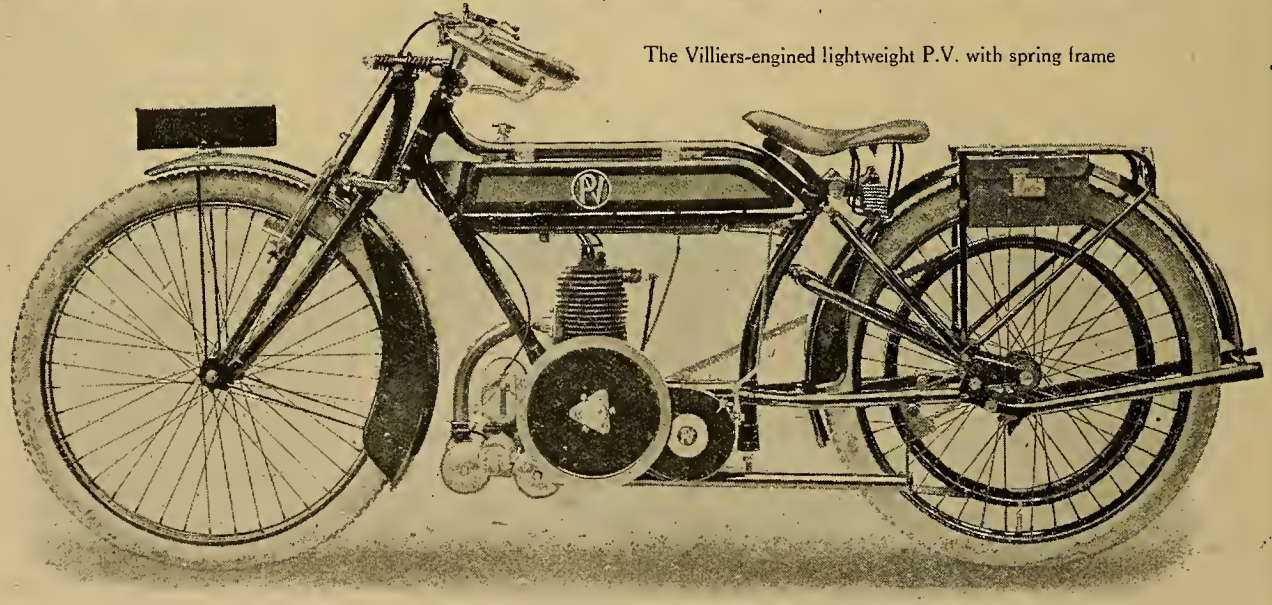
THE P.V. motor bicycle is famous as being one of the first motor bicycles made with a spring frame. Its makers, Messrs. Elliston and Fell, Perry Vale, Forest Hill, S.E., may therefore be regarded as among the pioneers so far as spring frames are concerned. Their latest pattern P.V. is a nice looking, well fitted up, and thoroughly practical little mount.

At the present moment it is made in the form of a lightweight, and is equipped with a 2¾ h.p. Villiers engine and a Chater-Lea two-speed gear box, transmission being by combined belt and chain. The spring frame has been considerably improved in detail since Messrs. Elliston and Fell have returned from serving their country in the army.

We may remind our readers that the system of springing consists of carrying the rear wheel in a sort of auxiliary pair of forks, which terminate in triangular malleable castings, and are carried on substantial bearings running through the main back fork ends. The forward end of the forks terminates in a peg secured to a fibre collar passing through a slot in the saddle tube. This fibre collar works between two coil springs in the saddle tube. The lower spring is secured by an adjustable plug, which can be moved by means of a spanner, thus allowing the tension of the spring to be altered so as to suit the weight of the rider. The peg referred to runs through a damping box consisting of a shoe lined with leather and kept in tension by a light spring. This serves also to cover up the slot in which the sprung portion of the frame is free to move, thus excluding any mud and grit. The saddle tube in which the springs are to be found is packed with grease when the machine is delivered, and no further attention is needed for a very long time.

Points of convenience have been well studied in the P.V. There is a small pyramid of gauze above the petrol outlet, so that no dirt can reach the carburetter. The rear brake spindle is mounted eccentrically, and if the nut by which it is secured to the frame be loosened and a peg inserted in the hole conveniently provided, the adjustment of the brake is an extremely simple matter.

The machine is suspended in front on Brampton biflex forks, an extra heavy chain is fitted, and the handle-bars are wide and comfortable. We tried the machine on the road, and found the springing to be excellent in every respect. There is no possibility of side play, the wheel is the only unsprung weight, and there is no doubt that it satisfactorily absorbs all serious road shocks.



The Villiers-engined lightweight P.V. with spring frame

The Machine—Not for the Multitude.

A Plea for a Rolls-Royce of Motor Cycles.

THERE is a very important distinction between the snob and the man who likes to ride a little above the common flotsam and jetsam of the multitude. There is nothing more hateful and despicable than snobbishness, but, at the same time, there are many excellent men, hail-fellow-well-met in every sense of the word, who hate to be one of a crowd. Considering the cosmopolitan nature of the brotherhood of motor cyclists, this is particularly so in that community.

It is not because the motor cycling fraternity has its objectionable element that many riders want machines out of the ordinary. It is not at all in a spirit of snobbishness. We have heard enough about Rolls-Royce owners who look down with a sneer on the drivers of Fords. Personally I know more than one Rolls-Royce owner who keep, in addition, a veritable stud of Fords —not because they enjoy driving Fords, but because Fords are endlessly useful. They will go anywhere and do anything within the power of the Rolls-Royce, their initial cost is but a flea bite—why then does the Rolls-Royce exist?

I have seen the same question applied to motor cycles. If a well-powered three-speed machine can be bought for ninety guineas, who will pay a hundred and ten for a mount that can do very little more?

The answer is—scores! Not because they want to spread themselves and pose as a little above the rest, but because, with the most kindly feelings on earth, they desire to ride a shade above the crowd.

A Market Exists.

It has been pointed out that the motor cycle is the poor man's mount, being the cheapest of self-propelled vehicles, but there are scores of men who ride motor cycles not because they are cheap, but because they afford the most sporting and attractive means of travelling. The matter of price does not enter into the question at all. If the best motor cycle made were double its present price they would ride it all the same, and if there were one machine, the finish, running, and beauty of which warranted the expenditure of an additional twenty guineas over the common run of motor cycles, then there are scores who would buy it for the pleasure of possessing a mount which would be a source of comment among their friends and an additional pleasure to handle. They would not buy it because it was dear, but because for the additional twenty guineas or so they obtained a Rolls-Royce among motor cycles—a standard of refinement and finish for which the man of the multitude did not think it worth while to pay. I am certain that if some firm of modest output concentrated their energies on the production of a solo mount de luxe, which would inevitably appeal to the sporting rider to whom initial cost was not of much consequence, they would only have to exhibit at the proper season and at the proper place in order to obtain all the orders they required.

Some Necessary Points.

The manufacturer may know that certain features are desirable, but ordinarily he is prevented from including them on account of the question of cost. In the production of the machine de luxe this is just the spirit that must be avoided. If the purchaser of this type of machine regards a certain feature as desirable, then give him the opportunity of having it and he will not grumble at the cost.

An earnest effort must be made, however, at keeping down the weight. Hitherto the British manufacturer's idea of turning out a *modèle de luxe* has been to add a whole chaos of weighty gadgets to a standard model. That is quite the wrong principle. We do not want gadgets. A spring frame may be all right, but it must be light and simple. Chain cases we can do without so long as we have efficient chain shields, though, of course, we would prefer an enclosed shaft drive with phosphor bronze to steel plate clutch integral with the gear box.

The type of engine is one the manufacturer must choose in accordance with his own ideas in order to produce a harmonious mount, but it must be silent, capable of a slow tick over, and of terrific revs., and of even torque. It would seem to rest between the four-cylinder and the flat twin, though it is to be hoped someone will have a shot at the three-cylinder two-stroke. The machine must be nippy and handy on corners, and the adjustable bars should possess a sufficient range to appeal to every class of rider. The country potterer does not mind a machine capable of T.T. effects so long as it is docile, but the sportsman will not look at a machine designed throughout for the country potterer.

Let us have good, strong, ample tool cases, and special provision for carrying a complete set of spares, safely and securely in some out of the way corner of the machine. These little points go a very long way in influencing the practical man, and should not be set down as unimportant side issues.

Lighter Weight.

One thing that everyone will be demanding soon is a lighting dynamo, and here the question of weight again enters. It is possible now to make motor cycle engines much lighter than was thought advisable in 1914, but if we are to economise in weight we must have magneto-and-lighting flywheels. Think what we save! A flywheel of this kind need be very little, if any, heavier than an ordinary flywheel, which means that we dispense straight away with the magneto

The Machine—Not for the Multitude.—

and dynamo. Numbers of electricians are bringing their brains to bear on motor cycle and dynamo construction, while others are concentrating all their energies on the magneto, but where is the firm that bids fair to appropriate the business of the two by placing on the market two or three different sizes of magneto dynamos of the outside flywheel variety? The problem is far from being a really difficult one, and the demand for the right instrument will be great.

A Small Market, but Select.

Needless to say, the finish of the Rolls-Royce of motor cycles would have to be of superlative quality. It would not be wise to eliminate plated parts, but only those parts which could easily be cleaned should be plated. A horn is always necessary, so why not braze lugs on the handle-bars for it, also for the speedometer, the machine being turned out with all the best of ordinary fittings, permanently attached instead of being left to dangle in attitudes of distress at the end of 2,000 miles of riding.

But silence, sweet running, and cleanliness are perhaps the three most important points—especially mechanical silence. Everyone hates an engine that clatters, and personally I vote for side-by-side valves, since what one gains in actual revs. with overhead valves one loses in other ways. A well-tuned side-by-side valve engine is nearly as fast as—runs slower and pulls harder, and is less irritable to handle than—one which may obtain higher volumetric efficiency by means of overhead valves.

Anticipation.

So much, then, by way of a rough summary. We all have our own pet features, and it is impossible entirely to satisfy everyone, but the above are just a few fairly obvious and commonsense points of which probably all will approve. It is to be hoped someone will go to work on the lines suggested, for there are scores of riders who are hoping to be able to obtain something quite out of the ordinary a little later on. A firm of real engineering ability aiming at thoroughness—mechanical and superficial—is the firm to take it up rather than one aiming at gigantic output, and one has only to recall the splendid reputation enjoyed by one or two smaller firms who have followed these lines to understand that the demand for something "very good" is just as insistent as for another article at a lower price.

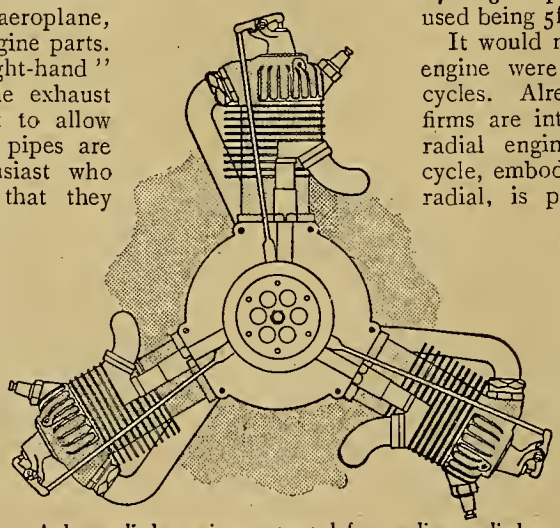
CHINOOK.

A Three-cylinder Radial.

Small Aeroplane Engine with Motor Cycle Cylinders.

IT will be remembered by many of our readers that A. V. Roe's early flights were attained with an aeroplane fitted with a J.A.P. motor cycle engine. The illustration given here shows a three-cylinder engine built up for an aeroplane, chiefly from Harley-Davidson engine parts. It will be noted that three "right-hand" cylinders have been used. The exhaust pipes are short and bent back to allow free exhaust, but the induction pipes are long, and the American enthusiast who built the engine recommends that they be made of aluminium tubing. A three-cylinder magneto is used, and the firing order of the cylinders is one, three, two, the nearest cylinder being passed over.

The ordinary motor cycle engine crankshaft can be used, but the crank pin has to be larger to allow placing the third connecting rod in position. This is accomplished by making two of the connecting rods thinner than usual and placing them inside the forked rod, which should be slightly wider at the fork. Obviously a special crank case is necessary. An engine of this character is said to be capable of developing 27 to 30 h.p. at 2,000 r.p.m., the propeller used being 5ft. 6in. diameter, 3ft. 6in. pitch.



A three-cylinder engine constructed from ordinary cylinders taken from Harley-Davidson engines, the crank case being, of course, specially designed.

It would not be surprising if this type of engine were developed for use in motor cycles. Already two well-known motor car firms are introducing light cars fitted with radial engines, and a lightweight motor cycle, embodying a diminutive three-cylinder radial, is promised shortly. The engine illustrated above would not be suitable for a motor cycle, but a similar engine fitted with cylinders half the capacity, *i.e.*, 250 c.c., would be quite compact; and, while a frame design departing from the accepted diamond pattern may be necessary, there should be no insurmountable difficulties preventing the accommodation of the engine as the power plant of a motor cycle, and a light and unusually efficient machine should result.

ROAD WARNING SIGNS.

DURING a recent long cross-country run, the writer was very forcibly impressed by the absurdity of the totally unnecessary overlapping of "danger" notice activities of the various associations which safeguard the tourist's interests. It is a moot point whether any real system prevails in the allocation of these signs, for, while a gentle bend may be adorned with a red triangle, the black and yellow A.A. sign, and an ancient C.T.C. board, one comes to innumerable blind turnings with no warning at all! Surely this is a point on which the bodies concerned might amicably combine: as it is, we are apt to grow a little careless of the possible danger indicated.

In answering this advertisement it is desirable to mention 'The Motor Cycle.'

The A.C.U. Six Days' Trial, Sept. 15th to 20th.

Extracts from the Preliminary Regulations of the Thirteenth Annual Event organised by the Auto Cycle Union.

Minimum weights and tyre sizes imposed. All machines to be weighed and the weights with details of specification to be published. Tests of reliability, silence, hill-climbing, acceleration, maintenance of efficiency, and petrol consumption. Starting and finishing point each day will be at Llandrindod Wells. Entries close August 23rd; at double fees on August 30th.

COMPETITORS ELIGIBLE.—Every competitor must be on the competitors' register of the Union, or of the Scottish Auto Cycle Union, or of the Motor Union of Ireland, or of any Colonial club recognised by the Union, or of any club in the F.I.C.M. other than the national clubs of Germany and Austria.

ENTRIES.—Entries will be received by the Union, at 83, Pall Mall, London, S.W.1, up to mid-day, Saturday, August 23rd, at ordinary fees. Late entries will be received up to mid-day, August 30th, at double fees. Entries must be made upon the official form, and must be accompanied by a remittance in payment of entry fee.

ENTRY FEES.—Entries from manufacturers or agents and for riders in their employ, ten guineas each entry. Other entrants: Five guineas each entry, or, if members of an affiliated club, four guineas each entry.

If in the opinion of the Union sufficient entries are not received no trial will be held. The entrance fee may be returned in full if no trial be held, but under no other circumstances will it be returnable.

Classification and Equipment.

DEFINITION.—A motor bicycle is defined as a vehicle comprising a frame, two wheels, and suitable engine. Motor vehicles with three wheels are included within the term motor cycle.

CLASSIFICATION.—All motor cycles taking part in these trials must conform to, and will be classified under, the following divisions and classes.

DIVISION I.
MOTOR BICYCLES.

Cylinder Capacity not Exceeding.	Minimum Weight without Oil or Fuel.	Minimum Diameter of Tyre (Cover and Inner Tube Separate and Detachable).
Class A, 250 c.c.	40 kilos (88 lb.)	45 mm. (1¾in.)
„ B, 350 „	50 „ (110 lb.)	50 „ (2in.)
„ C, 500 „	60 „ (132 lb.)	55 „ (2¼in.)
„ D, 750 „	70 „ (154 lb.)	60 „ (2⅜in.)

DIVISION II.
MOTOR BICYCLES WITH SIDECARS AND THREE-WHEELED CARS.

Cylinder Capacity not Exceeding.	Minimum Weight without Oil or Fuel.	Minimum Diameter of Tyre (Cover and Inner Tube Separate and Detachable).
Class F, 350 c.c.	80 kilos (176 lb.)	50 mm. (2in.)
„ G, 500 „	100 „ (220 lb.)	55 „ (2¼in.)
„ H, 750 „	110 „ (242 lb.)	60 „ (2⅜in.)
„ K, 1,000 „	120 „ (264 lb.)	65 „ (2½in.)
„ L, Any capacity Above 1,000 c.c.	175 „ (385 lb.)	65 „ (2½in.)

Nearest English equivalent.

Sidecars must be fitted with recognised touring bodies, and must be upholstered and finished with due regard to the comfort of the passenger.

WEIGHTS OF COMPETITORS, ETC.—The minimum weight of each competitor or passenger is fixed at 60 kilos. (132 lb.). Weight must, if necessary, be made up with ballast.

EQUIPMENT.—All competing motor cycles must be equipped as follows: Two independent brakes, a set of tools and receptacle therefor, mudguards projecting at least 10 mm. (7/16in.) on each side of the tyres, one or more petrol tanks with a minimum capacity of 5 litres (8.8 pts.), one or more oil tanks with a minimum capacity of 1 litre (1.76 pt.), and a complete set of lamps as required by law.

In addition to the above, motor bicycles must be fitted with a stand and a carrier, the latter having an available surface of at least 600 square centimetres (93 square inches).

SPARE WHEELS.—Spare wheels may be used on any competing motor cycle if carried throughout the whole trial. In the event of a spare wheel being used, the original wheel for which such spare wheel has been substituted must be carried throughout the remainder of the trial.

WEIGHING, ETC., OF MACHINES.—All competing motor cycles will be weighed, and the weights published. The frames, engines, and gear boxes will be sealed.

GEAR RATIO.—The diameter of the driving wheels and the gear ratios of every motor cycle shall be stated on the entry form and will be published. Should the ratios be indefinite, as in the case of motor cycles fitted with adjustable pulleys, the highest and lowest ratios obtainable shall be stated. A misstatement as to the gear ratios may involve disqualification.

SCHEDULE TIMES.—The schedule time will be calculated on a basis of 20 m.p.h., but extra time will be given when reduced speed limits and the like have to be covered. Any competitor passing any point of the route ten or more minutes in advance of his schedule time for that point shall be penalised one mark per minute or part of a minute in excess of the said ten minutes. Further, any competitor passing any point of the route twelve or more minutes later than his schedule time for that point shall be penalised one mark per minute or part of a minute in excess of the said twelve minutes, provided that competitors in classes A, F, G, and H, shall not be penalised unless they are fifteen or more minutes behind schedule.

The route card that will be handed to the competitor each day will state various points on the route, and the schedule time set for arrival at these points. Competitors will be started each day and restarted after the luncheon interval at their schedule time for the day, and competitors late in starting in the morning or after the luncheon interval will lose one mark for every minute or part of a minute that they are so late. In any one day the maximum loss of marks due to deviation from schedule shall be limited to 30.

Any competitor more than one hour late at the conclusion of the day's run shall be deemed to have retired.

DRIVERS.—Every competing machine shall be driven by the same person throughout the trial, unless before starting on any day's run after the first he shall be physically incapacitated, when his place may be taken by a substitute on notice being given to the secretary at least thirty minutes before the time the first competitor is due to start.

REPLENISHMENTS.—No cleaning, repairing, or adjustment may be effected in controls. Replenishments of petrol, oil, and water may be made only at the official starting depot or during the luncheon interval.

Special Tests and Awards.

Nature of Test.	Marks Credited at Commencement of Trial.	How Tested.	Penalties.
Reliability	50	Adherence to schedule	1 mark per minute or part of minute over allowance.
Silence	10	Special apparatus	Max. penalty, 30 per day.
Hill climbing	30	Non-stop sections	4 marks per stop.
Acceleration	20	*Fast and slow climb	Maximum loss, 20.
Maintenance of efficiency	20	*Special test	Maximum loss, 20.
Brakes	10	*Special test	Maximum loss, 10.
Mudguards	10	Examination	Maximum loss, 10.
Condition at finish	50	Examination	Maximum loss, 50.
Total	200		

On one half-day's run of the trial the consumption of petrol may be recorded.

Minimum number of marks required to gain awards:

		Gold.	Silver.	Bronze.
Division 1	Class A	150	135	110
	„ B, C	180	165	140
	„ D, E	185	170	145
Division 2	„ F	150	135	110
	„ G	160	145	120
	„ H, K, L	180	165	140

* Particulars of these special tests will be published in the final instructions.

,, 28th	... ...	9.24 ,,
,, 30th	... ...	9.21 ,,

Important Notice.

Owing to the August Holidays, the issue of *The Motor Cycle* for August 7th must be closed for press earlier than usual. All copy and instructions for *Miscellaneous Advertisements* in that issue must, therefore, be in the hands of our publishers not later than first post on Thursday, July 31st.

Falling Prices at Government Sale.

Lower prices were the general rule at the Government sale of motor cycles held last week at the Agricultural Hall, Islington. "Bargain" 2¾ h.p. Douglas motor cycles were sold for the low figure of 8½ gns., whilst 4 h.p. models of that make realised an average price of 18 gns.

Peace Day Decorations.

Messrs. The Enfield Cycle Co., Ltd., 48, Holborn Viaduct, E.C., on Peace Day, when the Victory March passed their showroom, had on view a suitable display demonstrating a feeling of loyalty and respect for those who, previously under their employ, have fallen in the war. Their names, numbering 200, were draped with both the American and British flags, and suspended over one of the Enfield motor cycles, which was decorated with the colours of the British Empire.

A Prominent Director Retires.

We learn that Mr. M. J. Schulte, for many years a director of the Triumph Cycle Co., of Coventry, has resigned his position and will retire into private life. Thus an excellent sportsman retires from the motor cycle world, and he will be greatly missed, for he was a prominent figure in the leading competitions, particularly the Tourist Trophy Race, in which event he annually took the keenest possible interest. Mr. Schulte's faith in the future possibilities of the motor cycle never wavered, and he and his company proved a tower of strength in and around the dark period of 1904 and 1905, when the industry was tottering owing to the production of heavy high-framed machines, which were unpopular; moreover, the uninformed daily press did its utmost to kill the pastime for ever by the publication of damaging articles. At a later period, but long before the war, Mr. Schulte recognised in the high-tension magneto the solution of ignition troubles, which were a real source of dissatisfaction with motor cycles in the early stages of their development, and endeavoured to establish manufacturing facilities in this country, but in this he met with little encouragement.

The Motor Cycling Club Team Trial.

The inter-club team trial for the fifty guinea cup presented by *The Motor Cycle* will be held by the Motor Cycling Club on September 6th, starting probably from Oxford. A notice has already appeared in the press inviting clubs interested to send in their names to the secretary, Mr. Southcomb May, 34, Gower Place, London, W.C., and so far favourable replies have been received from the following clubs: The Nottingham and District M.C.C., the Ealing and District M.C.C., the Essex Motor Club, the Middlesex M.C.C., the Woolwich and District M.C.C., and the Public Schools M.C.C. We are asked to state that full particulars will be sent to the various clubs at an early date, and that, so far as is possible, the original rules will undergo very little alteration. This year it is proposed that each team should consist of three solo and three sidecar drivers.

Special Features.

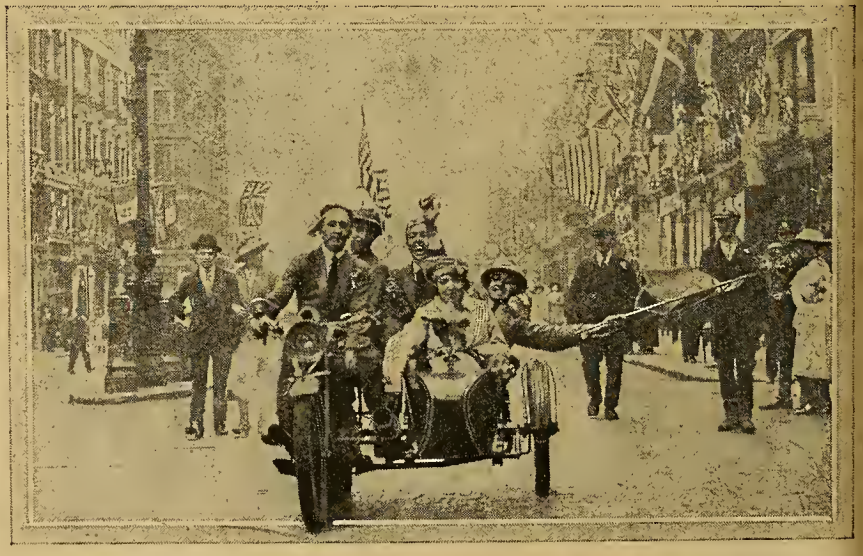
SCOTTISH TRIALS.
A.C.U. SIX DAYS' REGULATIONS.
AN UNCONVENTIONAL DESIGN.

Broken Glass on Roads.

The Automobile Association offers a reward of one guinea for information and evidence necessary for prosecuting persons deliberately placing broken bottles, etc., on the roads. For a considerable time motorists have suffered from this dangerous practice, and numerous cases have been reported by the Automobile Association to the police, but complete evidence has not always been possible.

Carburetter Patents.

An interesting decision relative to carburetter patents was made by the Acting Controller of Patents, on the 15th inst. An opposition was lodged against the sealing of letters patent, applied for by Mr. Arthur Cox, in respect of the Cox-Atmos carburetter by Messrs. Chas. H. Pugh, Ltd., and Mr. G. F. Bull, on the ground that certain features were anticipated in the Senspray carburetter. The opposition was dismissed as it was held that Mr. Cox's claims are clearly limited, and had not been claimed for the Senspray.



In nearly every city the motor cycle played a prominent part on Peace Day. The picture shows a happy party of London motor cyclist sightseers.

The Repeated Successes of the

The Birmingham Small Arms Co., Ltd.,
Small Heath, : : Birmingham.

Why you wait.

During the first years of the war, the Allied Governments demanded all our facilities for the production of CLYNO Sidecar Outfits for service on the various fighting fronts—later, in addition, our facilities were urgently requisitioned for the manufacture of complete Aero Engines, and even to-day we are not wholly through with our commitments in this direction.

Hitherto, "our written word" was all the evidence which we could offer, but to-day we've more convincing proof, in the form of a factory illustration reproduced from a photograph taken in the CLYNO Works, which are still very largely—in fact almost solely—employed on this concentrated effort.

Why you benefit.

Experience—a widened, more comprehensive experience in the building of the Internal Combustion Engine—has brought with it a greater knowledge of the possibilities of this wonderful source of power, and our staff are certainly more capable to-day of turning out an even better CLYNO than that which earned so enviable a reputation in the pre-war period.

But you benefit, *too*, in the fact that, while mass production has so far been impossible, every vital feature in the design of both our 1920 8 h.p. Model and The Aristocrat of the Lightweights—the 2½ h.p. CLYNO—has been finally tested and approved, and that the Machines themselves in the several trials in which they have been entered have proved beyond refute their absolute reliability.

You wait, but to-day we can assure you not for long.

CLYNO ENGINEERING Co.,
Pelham Street, Wolverhampton.

Police Traps.

Police traps are in operation in the neighbourhood of Solihull and Knowle.

Registration Numbers.

Following the example of London and other places, Wiltshire and Coventry have had other index marks assigned to them, viz., HR and HP, in addition to the existing letter AM and DU respectively.

The Humber Staff Trial.

The results of the "staff" trial organised by the Humber Co., and described in last week's issue, are as follow: Silver cup for the best performance, E. C. Gilliard (3½ twin Humber). Gold medals: F. C. Brown (3½ twin Humber), F. Yates (3½ twin Humber sc.), and E. M. Powell (15.9 Humber car). Silver medal: W. H. Turner (3½ Humber sc.). Sixty riders competed, of which fifty were motor cyclists on machines of various makes.

Rudge Prices Raised.

Rudge-Whitworth, Ltd., announce a further advance of prices to take effect from August 1st.

The retail figures stated below will apply to orders in hand, which will be invoiced at prices ruling at time of delivery:

	£	s.	d.
3½ h.p. Rudge-Multi roadster...	90	0	0
3½ h.p. ,, ,, T.T. roadster	90	0	0
5-6 h.p. ,, ,, ...	98	0	0
Rudge sidecar	33	10	0

The increase only amounts to slightly over 50% on pre-war prices.

Benzole and the Scott—a Warning.

Riders of Scott machines should bear in mind that indiarubber is soluble in benzole. One of our readers who uses a Scott was recently much mystified by his engine refusing to pull, with periods of bad misfiring, when travelling slowly. He had been using benzole, finding it to give better results than petrol for sidecar haulage; but, now, taking his engine adrift, he was surprised to find that the rubber compression rings between the cylinders and the crank case were completely dissolved, all that remained of them being a suggestion of rubber solution adhering to the joints. The machine had run less than 1,000 miles on benzole, so other Scott riders should beware.

Army Sale of Motor Cycle Tyres.

During recent Government sales at the Agricultural Hall, Islington, a large number of second-hand motor cycle covers were offered for sale.

The majority of the lots, each consisting of a bundle of twenty "bargain" covers, for which it was evident there was a great demand, were knocked down for £4, the buyer then having the option of purchasing the next five consecutive lots at the same figure.

A large number of motor cycles were also offered for sale; the prices realised, however, remained at approximately the same figures as at the previous sales. The organisation of the dates and nature of future sales has been improved. Definite sales are now arranged for 6 p.m. on Mondays, 11 a.m. and 6 p.m. on Wednesdays, and 6 p.m. on Fridays.

An American Record Broken.

The "three-flag record" (in which the rider starts in Canada, crosses America, and enters Mexico) was recently lowered by "Hap" Scherer riding a sports model Harley-Davidson flat twin. His time for the distance of 1,716 miles was 64h. 58m., the average speed for the run being 26.4 m.p.h.

Open Trial, York-Edinburgh-York.

The York and District M.C. is running an open reliability trial for all types of motor cycles and cars on August Bank Holiday. The start will be at midnight on August 3rd. The course is an easy one from York to Edinburgh and back. Entries close on Monday next. The secretary is Mr. G. A. Reed, 6, Blake Street, York.

Motor Cyclist Airman.

Mr. Trevor T. Laker, the ex-competition rider, whose photograph we gave alongside his aeroplane in our issue for June 5th, advises us that the general public is quite keen to take flights. Mr. Laker is located at Nuneaton, from which place he made over seventy flights during one week. Mr. Laker is associated with a private company which will shortly have aeroplanes at several seaside resorts.

State Sales.

The Ministry of Munitions (Disposal Board) has realised, up-to-date, over £132,000,000 as a result of the sales of surplus war stores.

In many cases, as for instance in the sales of machinery, much of the material was sold at higher prices than cost; while during last month alone £300,000 was taken in the sales of mechanical transport at Kempton Park and the Agricultural Hall, Islington.

The Six Days' Trial.

The Auto Cycle Union intends that the machines in the forthcoming Six Days' (which will be held from September 15th to 20th) will be subjected to an adequate test without resort to freak routes or regulations.

A.C.U. and the Arbuthnot Trophy Trial.

The committee of the Auto Cycle Union announce that valuable information was obtained in the competition for the Arbuthnot Trophy, and that this will be of much assistance in the promotion of other trials.

Unique Test.

To show that evidence often given in law cases where the speed at which a car or motor cycle is travelling is not to be relied upon, the Sheffield Club recently organised a speed-judging competition at which the general public were asked to estimate the speed of the competitors. The general results were in every way satisfactory, as proving that the average person has not the slightest idea of the speed at which a machine approaches him. A similar event is being held later when the police will be invited.

Obstructing the Police.

Recently a Hailsham motor cyclist was summoned at Enfield for exceeding the speed limit and for obstructing the police, the evidence being that after being timed and stopped he returned into the trap and warned other motorists to slow down. He was defended by the solicitor of the A.A., and, while admitting the speed offence, the case of obstruction was resisted, a previous judgment of the Lord Chief Justice being quoted. The defendant was fined three guineas for exceeding the speed limit and the charge of obstruction was dismissed.

A new use for a three-wheeler. An enterprising refreshment caterer converts an A.C. carrier into a mobile "bar."

The Scottish Six Days' Route.

NOTES ON THE COURSE OF THIS WEEK'S BIG TRIAL.

IT is no discourtesy to the A.C.U. to say that the hardest riders in England enjoy the Scottish Trials as they enjoy no other jaunt. It is not merely that they provide us with a thorough change, though everything is new, from the joy of hearing a man pronounce Rudge as though it began with eighteen "r's" to defying the ridiculous ten-mile limits which bestrew the north of Tweed. It is simply that in England we have neither the hills nor the scenery which Scotland can furnish. No country can furnish a more sporting course, and no committee could run an official trial in a more sporting spirit than the Edinburgh and District M.C. If the event has a solitary defect, it is that tyre troubles are apt to bulk too largely in its history.

On the first day the route is from Edinburgh to Perth: forty miles as the crow flies, and 157 miles by the official route. The cream of the run is our old friend Amulree, which commences with a long bumpy climb on the straight, and suddenly culminates in an evil double hairpin. Its gradient should not bother any modern machine: the trouble is that the surface sets a machine plunging on the lower corner, and it is not easy to regain control in time to steer wide round the upper twist. Although a non-stop is insisted upon, this hill should not unsaddle any practised rider. Yet it must be remembered that the Scottish event always attracts a strong amateur element, and that their corner work is usually weak for the first day or two.

Tuesday confronts the entry with 168 miles, Inverness being reached by a big detour to the north-east. There is plenty of bad going along this stretch, and, if the roads are wet, timekeeping will be a prime consideration. Cairn o' Mount and Cockbridge are the two non-stop hills of the day. Cairn o' Mount is really an "engine hill," for none of its three corners are terrifying to modern machines. It is supposed to average about 1 in 9 for nearly two miles, but can only create real anxiety if its surface is patchy. The Scot puts up with any old surface on his by-roads until news comes along that a horse and cart have foundered in a soft patch. Then he sends up several waggon-loads of stone, and dumps them in the hole. Campbell MacGregor hears of it, and includes the road in his next trial. The last time I went up Cairn o' Mount, none of the entry kept their saddles, thanks to a hundred yards of slush interspersed with chunks of granite. After four years of war there may not have been time to patch the holes. If the weather is fine, the hill should be simple: if rain is teeming down, it might be unrideable in patches. Cockbridge,

On the second bend of Kenmore Hill, to be ascended next Saturday, the last of the six days in the Scottish trials.

The Scottish Six Days' Route.—

the second non-stop hill of the day, is of quite another type. It is a narrow track with hard surface, twisting up through a wood on to the moors with some fierce gradient at the bottom, and no really wild corners; it offers no terrors to a low bottom gear.

Inverness as a Centre.

Tuesday, Wednesday, and Thursday nights are all spent at Inverness: a pleasant innovation which permits riders to arrange for a change of clothing after wet or sultry days. On Wednesday Abriachan will probably be the non-stop hill. This is a "rider's hill," with some extremely rough going and sharp corners. The sidecar men must show prowess here, and the solo rider who keeps clear of his rivals will still find the full width of the road useful on two of the corners. The scenery all day is gorgeous, but there is so much atrocious surface that timekeeping will be strenuous work, and nobody will have much leisure to look about him.

To-day (Thursday) the competitors tackle the famous, or infamous, Applecross-Tornapress climb, of which no contour book can picture the terrors adequately. Within ten miles the route ascends from sea level to over 2,000ft., and comes right down again. This is only an average of 1 in 25, but no Scottish hills resemble inclined planes: they are engineered on the ladder and landing principle. These twin hills include gradients and hairpins galore, but neither will vex the well-handled solo mount seriously. The real trouble is the surface, which shakes up a rigid frame terribly. I usually dismount several times during touring descents, simply to rest my aching body and tired wrists. The summit is often veiled in thick fog; but when the atmosphere is clear, the outlook is gorgeously beautiful. On misty days ceaseless vigilance is necessary, for the hairpins spring up suddenly, and a careless rider may not see where the road has gone to in time to lug a sidecar outfit round the worst bends. Engines tend to get very hot on the climb, since the surface suggests low gearing where the gradient would accept top. Everybody will be tired when this day's run is over.

The Tit-bit of the Trial.

On Friday, Glendoe is the official precipice. This is another "engine hill," and modern machines ought to scamper up it: it has often been slaughtered by single gears. The Spittal of Glenshee is thrown in as a makeweight, and there is any amount of rank bad going.

On the last day, the number of gold medals is whittled down, as usual, by the inclusion of the "back stair" road up the Kenmore side of Amulree, which remains the *pièce de résistance* of the Scottish week, no research having elicited anything more trying. It is one of those hills which nobody has climbed until he is up it. To my mind, the danger point comes about a third of the way up at a left-hand bend of fair acuteness. A reef of solid rock constitutes the majority of the road surface at this point, and the twist reduces the pace to moderation. Then the back wheel gets on the reef, and in the resultant plunge the rider very possibly lets his engine conk out. If he keeps his engine going, he may either plunge off the track or let his back wheel lose its grip. So he has to wriggle through three perils almost simultaneously, and some will certainly fail. It is a case for wary path choosing at a crawl on bottom gear: the rider who wants to show off r.p.m. on such a hill will come to grief.

It must not be fancied that the seven official non-stop hills by any means exhaust the climbs of the trip: the whole route is freely littered with awkward places. The gist of the Scottish week is that it gives an engine very little rest: the route is too severe for those long trickles with the throttle closed down on a high gear. Incessant gear changes, incessant low gear work due to gradient or surface or corners, render the nominal 1,000 miles equivalent to 2,000 miles of average English going. In the A.C.U. trials we are accustomed to make up our week's mileage by a good deal of main road work between the wild patches. In Scotland they drive us hard nearly all the week.

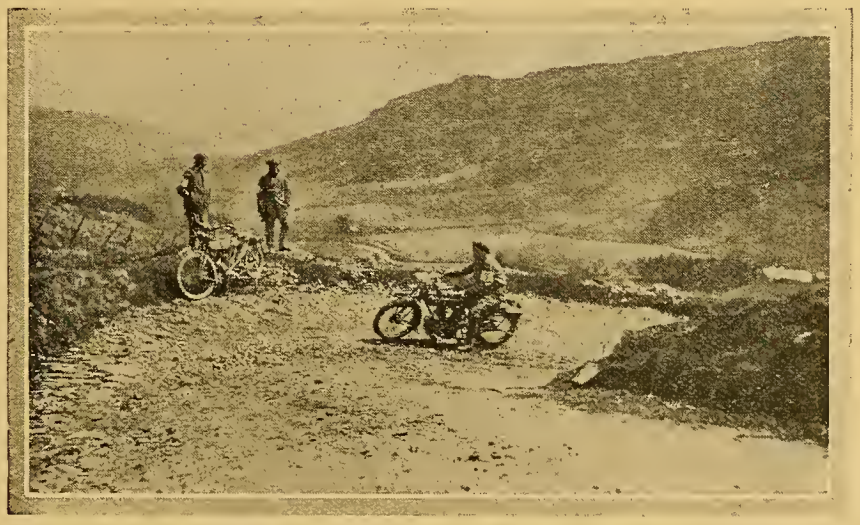
A Few Words of Advice.

Caution is advisable in corner work alike on the moor tracks and on those stretches which tempt one to catch up a few lost minutes. The character of the surface is always changing in the difficult pieces. Within a single mile of twisty road through foot hills and pines one may meet hard speed bits, soft mud, loose stone, deep ruts, and unexpected corners.

Plenty of tyre spares and a bulging repair kit are wise precautions, but if the rider fits a really stout back cover, the trip may be trouble free.

In some of the remoter districts petrol is almost unobtainable, unless the promoters of the trial manage to send a lorry full on ahead. It is, therefore, wise to carry enough for at least half the daily trip, and 100 m.p.g. consumptions are rarely recorded in such rough riding.

B. H. DAVIES.



The notorious hairpin on Amulree, one of the hills encountered by competitors on Monday last, the first day of the trials.

THE SCOTTISH TRIALS.

72 Competitors enter in this Week's Sporting Six Days' Trial; 50 started.

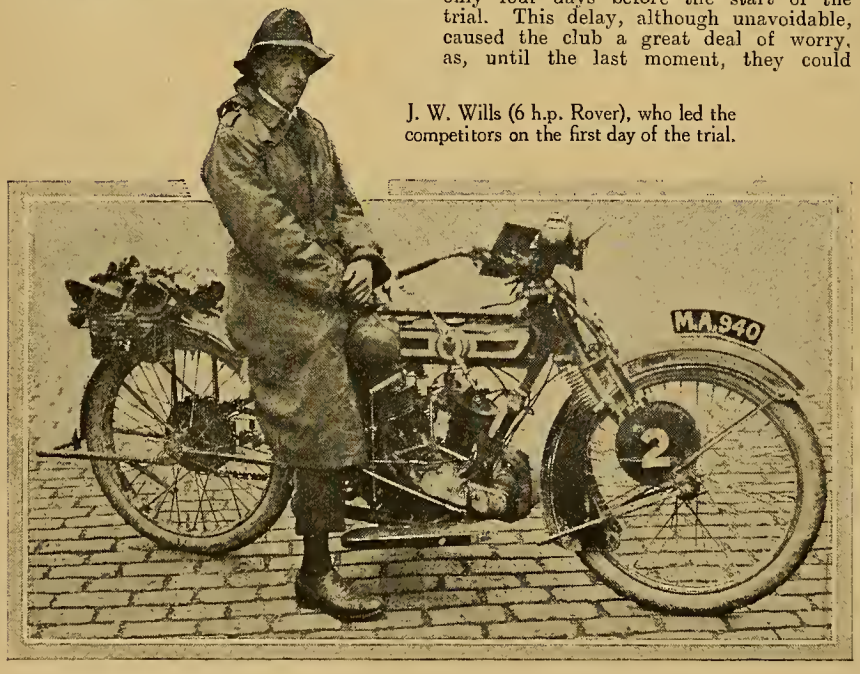
ALTHOUGH the Edinburgh M.C. did not expect a large trade entry for their first post-war Six Days' Trials, there is no doubt that the officials were disappointed when the dozen riders who had been entered were suddenly withdrawn in accordance with the decision of the Manufacturers' Union, to which we refer in a leaderette on the first page of this issue. The trial this year was organised more or less as a reunion after four blank years during which everyone concerned has been scattered all over the world, and the Scottish riders, who form the major portion of the private-owner element, and the officials of the Club were looking forward to meeting once again those trade experts who have so keenly appreciated the sporting nature of past trials and the treatment they have always received at the hands of the sporting Scotchmen. We know that every withdrawn trade rider—together with many who were not entered—was also disappointed, for this trial has always been a popular event, to be regarded as a strenuous but enjoyable holiday.

We think, however, that had longer notice been given, a representative trade entry might have been forthcoming. It was because it was not representative that it was withdrawn altogether. Unfortunately, the date of the trial was automatically fixed by conditions over which the organisers had no control. First, this week was the only convenient date when the many officials are on holiday. Secondly, it was utterly impossible to secure hotel accommodation in August.

Large Trade Entry Not Expected.

The decision of the Edinburgh M.C. to hold the trial was communicated to the Manufacturers' Union but three weeks before the event. Team entries were not expected, Campbell McGregor, the secretary, informed us, and a single competitor from each of the large manufacturers would have satisfied the club. This short notice, unfortunately, was not sufficient to enable the Union to arrange a meeting of manufacturers, who made their decision only four days before the start of the trial. This delay, although unavoidable, caused the club a great deal of worry, as, until the last moment, they could not estimate the number of entries, which made the catering negotiations somewhere difficult. In the meantime, a round dozen of trade riders were entered, and to have these withdrawn at the eleventh hour, as it were, was distinctly hard on them. However, the Scotchmen fully appreciate the difficulties under which manufacturers just now are working, and have taken the Union's decision in true sporting spirit. This year, they say, the trial will be an amateurs' and shamateurs' event, and the results will show how such owners can negotiate the Scottish hills on present-day machines.

Some of the officials of the Edinburgh M.C., the organisers of the trial: Messrs. W. Fraser, W. M. Smellie, R. R White, A. G. Ballantine, Campbell McGregor (centre), R. Dixson, J. Beaton, and Donald McKay (assistant secretary.)



J. W. Wills (6 h.p. Rover), who led the competitors on the first day of the trial.

Preparations.

EDINBURGH, SUNDAY MORNING.

"Pleasures are like poppies spread," said the immortal Bobby Burns, and Edinburgh this morning bore something of the spirit that inspired the lines. Saturday found Edinburgh festive till the small hours, but this morning the stately streets of Scotland's capital, always inspiring a sense of profound respectability on Sunday mornings, are enveloped also in an atmosphere suggestive of "the morning after." One or two of the members of the Edinburgh Club baptised themselves with glory at Lanark races yesterday, but this morning the officials of the great Scottish event, which starts to-morrow, bear expressions of languid boredom, and refuse to be harassed.

As a matter of fact Croall's garage is deadly dull, save for the usual frenzied *debut*, and the sudden withdrawal of the number of new riders are making their eleventh-hour preparations. A fair trade, it is pleasing to observe, accounts for only eleven gaps in the list of

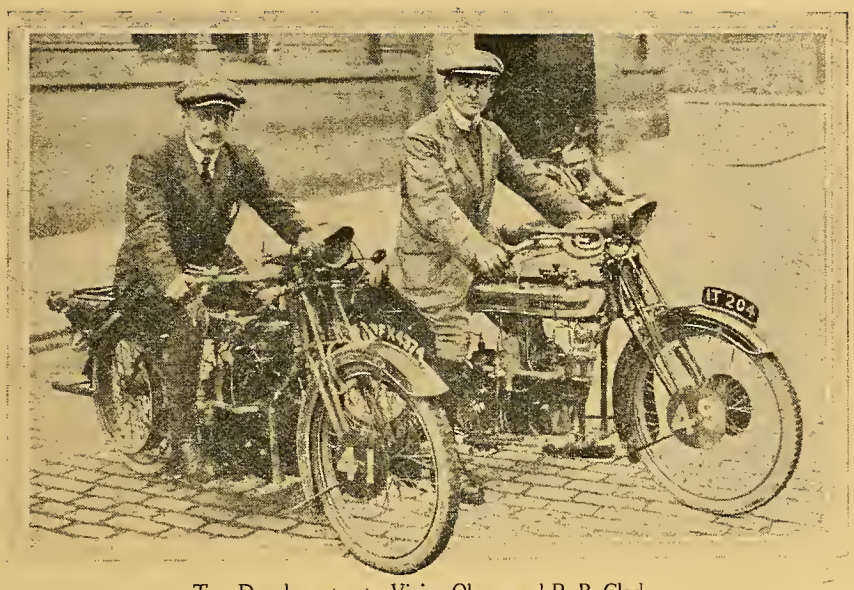
The Scottish Trials.

The Scottish Six Days' this year presents an aspect which, at any rate, is unique in its interest. The crack trade rider is ruled out, and this most sporting event is, for the first, and we hope for the last, time confined to the amateur and shamateur. Many of our readers will therefore view the event with special interest, the works-tuned mount being, for once, conspicuous by its absence.

The Machines.

The competing machines which are still assembling at Croalls presented very few features of special interest. George Wray, cheerfully optimistic in his profession of complete indifference as to the results of the whole event, is riding a 1914 Clyno, which is probably more business-like than it looks. The sole A.B.C. entry is equipped with a very neat Lucas lighting unit set, packed away in a tunnel, which is part of the gear unit, and E. W. Choldcroft's 4 A.J.S. is provided with a Low generator and Autoclipse head lamp—otherwise the lighting sets are of a most unpretentious order. Alan Hill's Morgan is one of the smartest little machines yet present, finished dark crimson, save for one bright blue bolt in the right wing, which, Hill asserts, is to remind him which way to turn on Applecross.

By the official programme, Newman's 3½ Sunbeam is entered as fitted with gears lower than standard, but, as a matter of fact, they are higher, the top being 4.6 and the two lower ratios in proportion. This rider anticipated carrying a lady passenger through the trial on his carrier, but has, happily, abandoned the idea. Baker's Scott is one of the most interesting and attractive machines present. It is fitted with disc wheels of his own making, and a special oiling system of unusal layout.



Two Douglas entrants, Vivian Olsson and R. B. Clark.

Mrs. Bell (6 A.J.S. sc.) is the only lady competitor, and G. C. Stead's A.C. is the only light car entry. We noticed that Carfrae had shed the chain cases of his Bradbury, while another Bradbury rider retired last night with stripped gears.

Judging from the machines, the mascot craze is coming to a dead end, and Brash, who carries a rabbit's foot as a mascot, is the only interesting exception. Macrae is carrying a small fishing rod lashed to the handle-bars of his Harley, with which, presumably, to while away idle moments *en route*.

The most harrowing and hair-raising reports keep dribbling through as regards the condition of the roads. The few good patches which existed in 1914 are now, it is said, as bad as the worst of the less frequented roads, being completely smashed up by timber haulage. Wednesday's route from Inverness to Beauly and Braemore encompasses a new hill which we are all learning to pronounce. It is spelt Aultnaharie, and correctly pronounced only as McGregor and his satellites pronounce it. It is on everybody's lips, in several translations, and some idea as to the ferocity of the gradient can be judged by the special clause in the rules: "In the event of 90% of the competitors starting that day failing on Aultnaharie Hill, failure on this hill will not disqualify a competitor from gaining a gold medal, but competitors who make a clean ascent will be awarded some form of recognition for their performance." Another observed hill may be substituted in the occurrence of many failures.

"Georgie Runciman" (Mrs. Bell), the only lady competitor.

From all accounts the hill has so far been climbed only by an A.C. light car, a 2¾ A.J.S., and a Douglas. It is said that the riders go round three sides of a cottage, and, on the third "leg," look down its chimney.

At Croall's Garage the Triumph, Douglas, and Sunbeam riders stand idly by their machines. Cool and soft-voiced officials proceed with the work of sealing. Wills, who will lead the competitors, anticipates a world of trouble. He has a hole in his crank case stuffed with solder.

A Blackburne and an A.B.C. have just ticked quietly into their places on the tan floor of the official garage, which, under ordinary conditions, is a horse repository.

By the time these notes appear in print three of the six days will have gone. The following are the courses for the last three days: THURSDAY, July 24th.—Inverness, Beauly, Marybank, Garve, Auchnasheen, Auchnashellach, Applecross (lunch) Jeantown, Auchnasheen, Garve, Inverness. FRIDAY. — Inverness, Drumnadrochit, Glendoe, Craggie Inn, Grantown (lunch), Cockbridge, Braemar, Bridge of Cally, Perth. SATURDAY. — Perth, Dalguise, Kenmore, Crieff, Falkirk, Linlithgow, Edinburgh.

The Entrants.

*J. Dudley (3½ Sunbeam)
J. W. Wills (6 Rover)
Claude Duncan (4 Douglas)
*Hugh Gibson (8 Clyno sc.)
*P. J. Enticknapp (4 Blackburne)
D. S. Milne (4¼ B.S.A.)
R. Spence (4¼ B.S.A.)
H. Macrae (7-9 Harley-Davidson sc.)
H. Alexander (8 Enfield sc.)
C. S. Burney (4 Blackburne)
F. J. Hutchison (4 Douglas sc.)
N. Black (4 Triumph)
J. Emerson (3 A.B.C.)
E. W. Choldcroft (4 A.J.S.)
W. Hoyland (4 Norton)
R. Hay-Will (6 A.J.S. sc.)
A. F. Selby (4 Blackburne)
G. Grinton (7 Harley-Davidson sc.)
"Georgie Runciman" (6 A.J.S. sc.)
R. B. Clark (4 Douglas)
*L. Newey (4¼ Ariel)
Duncan Bell (5-6 James sc.)
G. Wray (5-6 Clyno)
R. Carfrae (6 Bradbury sc.)
*J. L. Stocks (6-7 Ariel sc.)
H. Moir (3½ Sunbeam)
A. Downie (6 A.J.S. sc.)
D. Wright (3½ B.S.A.)
W. Deans (3½ Ariel)
*Frank Smith (8 Clyno sc.)
J. Robertson Brown (10 Henderson)
T. Rutherford (3½ Sunbeam)
D. S. Alexander (8 Enfield sc.)
G. C. Stead (10 A.C.)
*T. C. de la Hay (3½ Sunbeam)
W. Westwood (4 Triumph)
R. Hendry (5 Indian)
W. S. Jameson (2½ Diamond)
H. E. Fairley (4¼ B.S.A.)
B. Alan Hill (8 Morgan)
A. L. Downie (2¾ A.J.S.)
L. L. Sealey (4¼ B.S.A.)
Vivian Olsson (4 Douglas)
A. H. Alexander (4 Douglas sc.)
J. A. Newman (3½ Sunbeam)
J. R. Alexander (7-9 Indian sc.)
J. Shepherd (5-6 Campion)
*J. S. Holroyd (8 Blackburne sc.)
H. G. Cassie (4 Douglas)
E. R. Troward (——)
J. A. W. Beaton (8 Matchless sc.)
Jas. Beck (3½ Sunbeam)
*A. G. Cocks (2½ Clyno)
*A. F. Knight (8 Clyno sc.)
J. A. Jefferys (5-6 A.J.S.)
L. B. C. Cunningham (8 Morgan)
W. Young (4 Triumph)
P. Brady (3½ Douglas)
L. S. Fisher (3½ Norton)
D. Balloch (8 Matchless sc.)
J. Baker (3¾ Scott)
W. Strettell Miller (3½ P. and M.)
D. M. Brash (7-9 Harley-Davidson sc.)
E. J. Tunbridge (5-6 A.J.S. sc.)
A. Downie (5-6 Ariel)
Jas Balloch (6 Bradbury sc.)
*T. Peck (3½ Ariel)
G. Taylor (——)
W. C. Sutherland (4 Triumph)

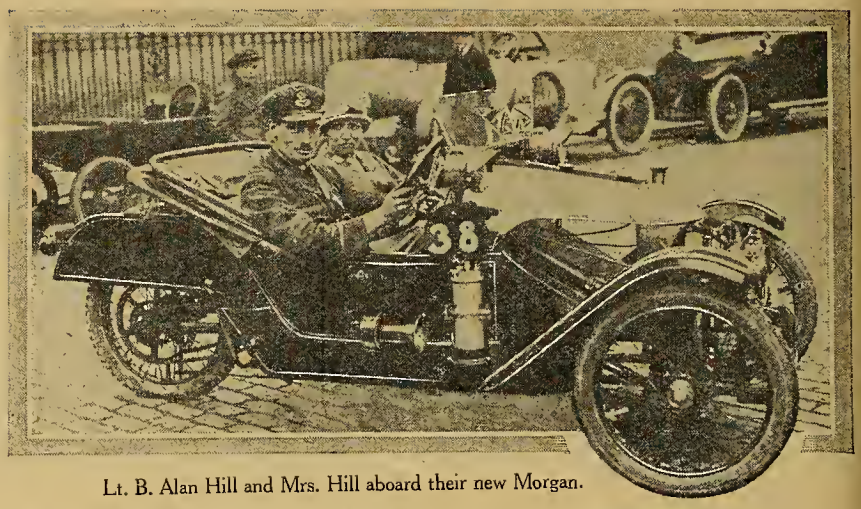
*Trade entrants withdrawn.

EDINBURGH, MONDAY.

As a strong contrast to the weather of yesterday, the sun shone brilliantly as, under perfect conditions, J. W. Wills (6 Rover) led the fifty competitors from Croall's Garage at nine o'clock this morning. In addition to the "trade" entrants, which were withdrawn, there were several other non-starters through various causes, but chiefly due to the non-delivery of new machines, several of which were held up by the railway strike. As the competitors went away in pairs and singly, disappointed entrants learnt from the newspapers that the strike had been settled. It lent a touch of irony that the settlement should come a few hours too late to benefit them, so far as riding in the trial is concerned.

Capt. C. S. Burney (4 Blackburne), L. S. Fisher (3½ Norton), D. Ballock (8 Matchless sc.), Robertson Brown (10 Henderson), T. Rutherford (3½ Sunbeam), and W. C. Sutherland (4 Triumph) all failed to face the starter. The greatest enthusiasm prevailed, and as the last man disappeared round Princes Street Gardens *The Motor Cycle* recorder of facts and failures mounted his Scott and followed, with the staff photographer on his Victory Matchless in pursuit.

A detailed description of the trial, with photographs, by our own representatives, will appear in the next issue of "The Motor Cycle."



Lt. B. Alan Hill and Mrs. Hill aboard their new Morgan.

Incidentally.

This year Alan Hill takes his wife as a passenger on his new red Morgan. In the 1914 trial he drove a Humberette with his mother as his companion.

Two Morgan entrants represent the runabout class and an A.C. is the only light car. Where was the Harding and Summers cycle car which competed in the 1913 and 1914 trials?

Newman did well to reconsider his intention to take his wife as a pillion passenger.

Georgie Runciman, who figured in the official programme is none other than Mrs. Bell—the only lady competitor this year.

It was hard to realise that five years had rolled by since the last Six Days' in Scotland when Lieut. McGregor was seen in mufti. The McGregor presents a fine figure in his kilts.

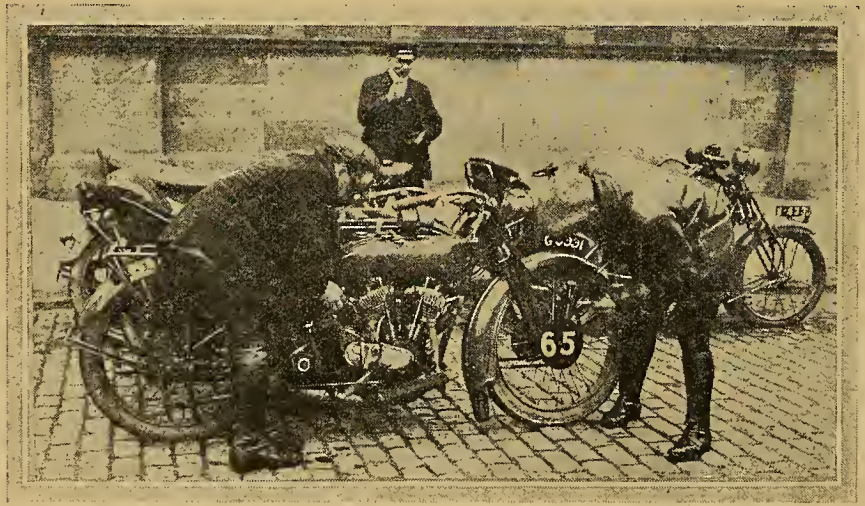
Will Harry Macrae succeed in getting his "bit of fishing"? He carries a fishing rod as part of his equipment, and intends to "blind" in places to steal the time out of his schedule.

Captain J. A. Jefferys, who is riding a 6 A.J.S. solo, is an Australian. It is his first competition, and he wishes to take back a "gold" when he returns to the Antipodes shortly.

The Clyno firm, with one of the most up-to-date machines on the market, is represented by one machine—an apparently much-worn 1914 model.

Although Army motor cycles were not allotted a place in the Peace Procession at Edinburgh last Saturday, they were doing a great deal of running about at speeds which would make the Edinburgh police look severe in normal times.

Aultnaharie is the "tit-bit" in this year's trial. To return to civilisation, it is necessary to climb it. Riders who fail to do this may have to wait a month for a ferry.



Finishing touches. The Brothers Brash take a final look round their Harley-Davidson

Midland Passenger Machine Trial.

Peace Day Event in Unfavourable Weather.

THE passenger machine trial organised by the Birmingham M.C.C. was arranged to take place on "Peace Day," and as the English climate usually justifies its reputation for changeability on public holidays the coincidence was unfortunate.

The meeting point was the Swan's Nest Hotel, Stratford-on-Avon, and, although the signs were by no means promising, the subsequent downpours were scarcely foretold.

Starting arrangements were in the hands of Mr. T. Silver, and everything was very smoothly carried out, the riders' own watches sealed, and the machines marshalled into order and started with the minimum of fuss. Starting was arranged at minute intervals, and competitors were not allowed to "warm up" their engines.

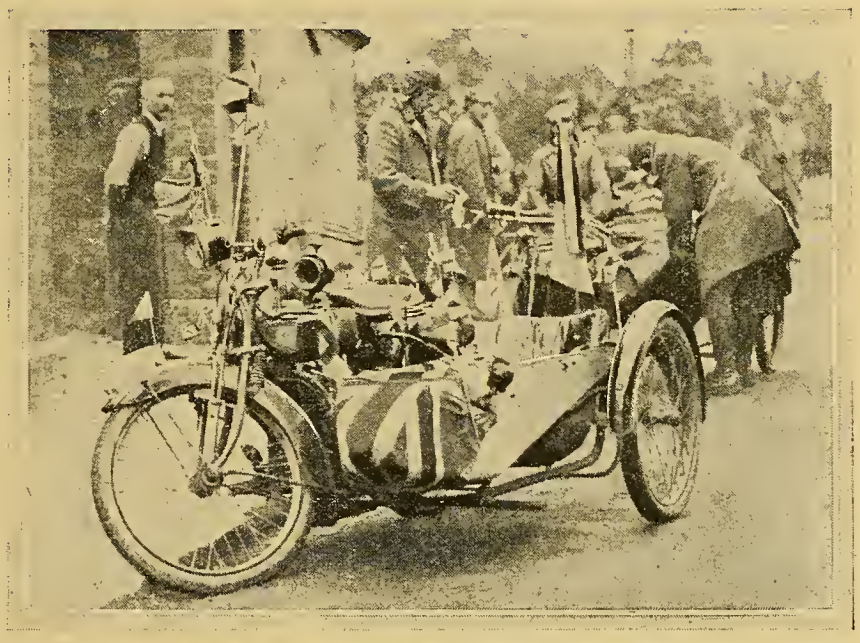
Only one competitor (on an American machine) had any difficulty in getting off. Most of the engines, indeed, responded to the first or second kick—probably the quickest in getting away was Kickham (Sunbeam), but there was really little to choose between the majority of starters.

The first test to be encountered was the stop and restart on Edge Hill; most of the machines performed well, and the greater part of the failures were, apparently, more the result of misunderstanding the instructions than inability of the engines and clutches to deal with a restart on this gradient.

Eveson (New Imperial sc.) and Birch (B.S.A. sc.) stopped before getting between the tapes. Dalby (Triumph sc.) evidently misjudged the stopping point but made a good restart, while Weaver (Harley-Davidson sc.), whose mount did not seem to be quite in the best of humours, ran back to the roadside, thus slightly baulking Kickham (Sunbeam sc.).

Descending Sunrising several competitors lost their way near Tysoe and by some means got on a round-about track and came up Tysoe again—Minton (Norton sc.) complained that he was quite familiar with Tysoe, having climbed it three times in his efforts to find the proper route!

Some bitter remarks were made about the blue-print tracing of the map supplied to competitors, but we think that the trouble was due to follow-my-leader tactics, and, as "no arrowing" was distinctly stated on the map, entrants would have done well to verify the route on the ordnance map. Beyond Chipping Camden, the rain began to fall, and, at Broadway, the roads were very slimy and bumpy.



A decorated James at the Midland Cup Trial on "Peace Day."

Several were disqualified for restarting their engines after the lunch stop at Cheltenham before the starter's signal, while the acceleration test on Sunrising largely decided the fate of many. Stretton Ward (Triumph sc.) and Benley (Morgan) made exceptional performances here.

By the time Edge Hill was reached on the homeward journey the entry was very considerably thinned, and rain fell in torrents during the last hour or so.

The brake test made here was something of a fiasco—indeed we cannot imagine any more impossible task than that of pulling up a machine in about two lengths after running more than half way down Edge in neutral, as the conditions required; indeed, it is probably fortunate for the lives of the riders that it was raining so heavily, for the locked back wheels which resulted from the sudden application of brakes simply skidded down the hill, whereas, had the road been dry, there appeared to be every chance of ripping off a cover, if nothing worse happened.

Most of the competitors who were left in the run flashed over the tapes at about 30 m.p.h., and on applying their brakes those who were able to stop at all overshot the mark by eighteen to thirty yards, while the others merely continued down the hill with locked wheels. This test could not be described as fair either to the machines and riders or safe to any of the general public who might be using the hill at the time.

No one amongst the eleven finishers succeeded in qualifying for either a cup or gold medal, but the team prize will probably go to the three New Imperial riders who finished.

Competitors in last Saturday's Midland Cup Trial discussing the course which they had lost. The group includes Minton (Norton), Vale (Douglas), Weaver (Harley-Davidson), and Kickham (Sunbeam).

HILL-CLIMB AT STILE COP.

Sutton Coldfield and Mid-Warwickshire A.C. Closed Competition.

H. Smethurst (3½ h.p. Norton) making a fast ascent of Stile Cop

STILE Cop is a safe hill, but hardly steep enough to test the capabilities of the modern motor cycle. The part of the hill used for the competition measures nearly threequarters of a mile in length (about 1,250 yards), and rises about 270 feet, giving an average gradient of 1 in 14, but the steeper portion near the top is 1 in 9. The hill is part of the road from Rugeley to Beaudesert, and is two miles from the former place. The surface was somewhat loose and very dusty until heavy rain began to fall; this commenced towards the end of the competition, and continued throughout the evening.

Considering that the hill-climb took place on "Peace Day," there was a good muster of competitors, and spectators were quite numerous. As usual, the smaller machines started first, and on this occasion some of the classes had to be combined owing to lack of entries.

Some excellent times were accomplished, though the record for the hill of forty-five seconds made in 1914 was not beaten. This was, however, made over a slightly shorter portion of the hill, so a fair comparison is not possible. It was often noticeable that the amateur riders were not so fast as their trade competitors, though many of them rode well. A lady was to have competed in Class 6, but, unfortunately, she met with an accident on her way to Stile Cop, and did not put in an appearance.

Amongst the small machines, the Levis was very prominent, as were the Norton and Triumph in the larger classes. The fastest time of the day was 49s. by J. Smith (3½ Triumph) (nearly 53 m.p.h.), but perhaps the most remarkable performance was made by G. Kuhn on a 2⅜ Levis, who came up in 51s. (51 m.p.h.). Other riders who completed the climb in less than 50s. were H. Petty (3½ Norton) and H. Taylor (8-10 Matchless), whose times were 49.6 and 49.4 respectively. The new 3 A.B.C. made its debut in a public hill-climb, the same machine that was used in our Staff Trial at Edge Hill being ridden by J. Emerson, and acquitted itself with credit, but Emerson told us that he was previously unacquainted with the hill and, expecting something much more severe, had geared the machine too low, viz., 6¾ to 1 on top. He ascended the hill in 56.4s. (nearly 46 m.p.h.) in Class 7, but perhaps his best performance was in the sidecar class, where he made fastest time, 78.6s. (over 33 m.p.h.) against a 4 Douglas, 106.2s., and an 8 Enfield, 88.8s.

Only one scooter presented itself for competition in Class 8, and this, a 2¾ h.p. Autoglider, ridden by C. R. Townsend, made an excellent ascent in 102.6 sec. Its formula figure was, however, low.

In comparison with the motor cycles, the cars which competed in Classes 14, 15, 16, and 17 seemed slow, L. Hands (25 h.p. Talbot) alone approaching the speed of the fastest motor cycles. His time was 54.4s. (47.6 m.p.h.). H. R. Godfrey (10 h.p. G.N.) came up alone in 75.2s. (34.4 m.p.h.).

The formula used was that long recommended by *The Motor Cycle*, viz., $\frac{W}{C \times t^2}$ but the results were not passed at the time of going to press.

FASTEST TIMES.

Classes 1 and 2.—W. A. Jacobs (1½ Singer), 65⅕s.
Class 3.—N. Hall (2½ O.K.), 75⅖s.
Class 4.—G. Kuhn (2⅜ Levis), 51s.
Classes 5 and 6.—J. Smith (3½ Triumph), 49s.
Class 7.—H. Taylor (8-10 Matchless), 49⅖s., and H. Petty (3½ Norton) 49⅘s.
Class 8.—C. R. Townsend (2¾ Autoglider), 102⅘s.
Classes 9, 10, and 11.—J. Emerson (3 A.B.C.), 78⅘s.

CARS.

Classes 14 and 15.—H. R. Godfrey (10 G.N.), 75⅕s.
Classes 16 and 17.—L. Hands (25 Talbot), 54⅖s.

A SPORTING SOCIAL RUN.

THE first social run of the Westmorland M.C.C. since August, 1914, took place on the 13th of July, 1919. Hostilities having ceased, many of the members have now been demobilised, with the result that about twenty-five members journeyed to Honister Pass. The climb was commenced at 3 p.m., and most of the machines reached the summit.

The star performance of the day was made by C. Whiteside (2¼ Velocette), who made the only clean ascent from the Buttermere side. A smile went round before the Velocette commenced the climb, but its magnificent performance surprised most of the members.

C. Whiteside (Velocette) on Honister Pass during the Westmorland M.C.C. sporting social run last week. Note the rough surface.

Bradford M.C. and L.C.C.

The above club is again resuming its activities, and has under consideration various competitions, including a speed trial, a hill-climb, and a reliability trial between Bradford and Edinburgh.

Carmarthen M.C. and C.C.C.

The Carmarthen Motor Cycle and Cycle Car Club are holding a climb at a well-known local hill on August Bank Holiday. Five classes will be decided on formula, and a special prize awarded for fastest time. The joint secretaries are Messrs. J. C. Evans and J. Jenkins, Nelson Hotel, Carmarthen.

Cumberland M.C.C.

Results of hill-climb at Warnell Fell :

Class I.—1, T. Stordy (2¾ A.J.S.)
Class II.—1, R. Drinkall (4 Triumph).
2, W. G. Harrison (4 Triumph).
Class III.—1, W. G. Harrison (4 Triumph).
2, R. Drinkall (4 Triumph).
Class IV.—1, R. Drinkall (4 Triumph sc.)
Fastest time of the day: H. Prescott (Harley-Davidson).

York and District M.C.

A reliability trial was held by the York and District Motor Club last week on a course over moors in North-east Yorkshire. The roads to Whitby were in fine condition, and the run was thoroughly enjoyed. A stopping and restarting test at Saltburn on a hairpin bend was unexpectedly introduced, but the results cannot yet be announced, owing to the check sheets being held up by the railway strike.

Ealing and District M.C.C.

At a re-inaugural meeting of this club, held in the Broadway Cinema, Ealing, many new ideas and suggestions were forthcoming. The social side of the club life was strongly advanced, and the suggestion of J. J. Hilyer, to form a limited company with the object of providing a country club house, was enthusiastically received. The club secretary is Mr. S. P. Lissant-Brown, "The Laurels," Ormiston Road, London, W.12.

N.M.C.F.U. Gymkhana (Birmingham).

The Birmingham branch of the N.M.C.F.U. is holding an open gymkhana on July 26th at the Red Lion Hotel sports ground, Knowle (on the main Birmingham-Warwick road). The six events (open to any motor cyclist) include slow race, obstacle race, ladies' driving contest, plug removing race, musical chairs, etc. The first event starts at three o'clock, and the proceedings will terminate in time for everyone to get home before lighting-up time. There will be two prizes in each event, entrance fees being one shilling. The secretary is Mr. F. Murray, Strathmore, Wharfdale Road, Acocks Green, Birmingham.

Future Events.

July 24.—N.M.C.F.U., Leeds. General Meeting, Green Dragon Hotel.
July 24.—Taunton and District M.C.C. Treasure Hunt.
JULY 25-26.—LIVERPOOL M.C. TWENTY-FOUR HOUR OPEN TRIAL.
July 26.—N.M.C.F.U. (Birmingham). Open Gymkhana.
JULY 26.—SUTTON COLDFIELD AND MID-WARWICKSHIRE A.C. LIGHTWEIGHT TRIAL FOR CALTHORPE CUP.
July 26.—Western M.C.C., Glasgow. Run to Lake of Monteith.
July 26.—N.M.C.F.U., Portsmouth. Run to Poole Park and New Forest.
July 26.—Public Schools M.C.C. Six Hours Night Reliability Run.
July 26.—N.M.C.F.U., Portsmouth. Run to Warsash.
July 26-27.—Wolverhampton M.C.C. Reliability Trial to Aberystwyth for Stevens Cup.
July 27.—Streatham and District M.C.C. Picnic Run to Ashdown Forest.
July 27.—Ilkeston and District M.C.C. Run to Malvern.
July 27.—Troedyrhiw and District M.C. Reliability Run
July 27.—N.M.C.F.U., Leeds. Run to Malton and Castle Howard.
July 27.—Woolwich, Plumstead, and District M.C. Vice-captain's Surprise Run.
July 27.—Birmingham M.C.C. Social Run and Picnic.
July 29.—Rochester, Chatham, and District M.C. Inter-club Meet with Woolwich and Streatham Clubs.
AUG 4.—YORK AND DISTRICT M.C. OPEN RELIABILITY TRIAL TO EDINBURGH AND BACK.
Aug. 4.—Carmarthen M.C. Hill-climb.
Aug. 10.—Birmingham M.C.C. Social Run to Monsal Dale.
AUG. 16.—S.E. COUNTIES INTER-CLUB TEAM TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL FOR THE PALMER CUP.
Aug. 16-17.—Wolverhampton M.C.C. Reliability Trial to Barmouth for the Eric Williams Shield.
Aug. 22-23.—Essex M.C. Annual Run Woodford to York and back.
AUG. 23.—BIRMINGHAM M.C.C. OPEN HILL-CLIMB.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 31.—Birmingham M.C.C. Social Run.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
Sept. 6.—Birmingham M.C.C. Reliability Trial for Sonster Cup.
SEPT. 15-20.—A.C.U. SIX DAYS' RELIABILITY TRIALS
Sept. 19.—Essex M.C. Gymkhana.

South Eastern Counties Inter-club Team Trials.

The competition for the Woolwich, Plumstead, and District M.C. Trophy will be held on August 16th, and is open to teams of six from any club. Any type of vehicle under A.C.U. regulations may be entered. Gold medals will be awarded to members of the winning team, and an additional medal to the competitor making the best performance outside the cup winners. Previous holders of the cup are: Brookdale Motor Club, 1912; Woolwich, Plumstead, and District M.C., 1913. Entries close on August 8th, and secretaries wishing to nominate teams should communicate with Mr. F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

Southport A.C.

The Southport Automobile Club held a meeting recently for the purpose of electing officials for the ensuing year. The club promises to become one of the largest in the North, and prospective members should note that the address of the honorary secretary *(pro tem.)*, Mr. Harry Dobson, is 3, York Avenue, Southport.

Wolverhampton M.C.C.

A reliability trial to Aberystwyth and back is being run by the Wolverhampton M.C.C. on Saturday next, returning the following day. The chief award is the Stevens Cup. No route cards will be issued, and timing will be by competitors' own sealed watches.

The start will be from West Park entrance, at 2.30. The trials secretary is Mr. J. E. Greenwood, 1, Stubbs Road, Wolverhampton.

North Cheshire M.C.C.

At the reliability run held last week, T. C. Lawton on a 4 h.p. Triumph arrived in nearest on time, thereby gaining the Mather cup. Oliver Jessop, also on a 4 h.p. Triumph, ran second.

A picnic on the river Dee (Chester) has been arranged for July 27th. The club will meet at the Trafford Arms Hotel, Alderley, at 2 p.m. All are cordially invited, and should communicate with the hon. sec., Mr. W. R. Eadington, London Road, Alderley Edge, Cheshire.

A Works Club.

The staff and employees of the Cosmos Engineering Co., Ltd., Bristol, have recently formed a club of fifty members, and ran off a very successful reliability trial, including a fast hill-climb on Wimley Hill. The President's challenge cup for reliability was won by G. Powlesland (3¾ Scott combination), the runner-up being J. Brownsey (7-9 Matchless combination).

The club has an excellent programme, and is affiliated to the A.C.U. The secretary is Mr. H. Smallwood, Cosmos Engineering Co., Ltd., Fishponds, Bristol.

Ealing and District M.C.C.

A social run from Kew Bridge to Ripley was attended by over forty members, and after tea a fault-finding competition was held, the machine being a 1919 5-6 h.p. Rover, lent by Mr. F. A. Longman. The following "faults" were arranged. 1. Paper between platinum points. 2. Plug points hammered together. 3. Cardboard between inlet valve and tappet. The winner was S. A. Lees, who eliminated the three faults in 3 min. 25 secs., the remaining competitors all exceeded the time limit without tracing the three faults.

All letters should be addressed to the Editor "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

PLEASE QUOTE PRICES.

Sir,—With reference to "Sussex's" letter in a recent issue, "Please Quote Prices," I might say I quite agree with him that all manufacturers should give prices in the advertisements of their goods, but perhaps he would like to know that some firms who advertise in your paper have *not even sufficient courtesy to reply* when one makes enquiries about their goods, and *sends stamped addressed envelope for a reply.*

I think it only fair to your readers that you should stipulate in your rules *re* advertisements that no advertisement can be inserted without the prices of such goods mentioned in the advertisement being quoted. It would save your readers much time, paper, and postage.

I hope you will be able to take this matter up strongly with manufacturers. H. F. BARTLETT.

BENZOLE.

Sir,—I notice in *The Motor Cycle* of June 19th a letter from the secretary of the A.A. and M.U. stating that the price of benzole is now 2s. 9d. per gallon. Motor cyclists are also continually being urged to use benzole as it is a home-produced product. Petrol can be obtained in Scotland at from 2s. 6d. to 3s. per gallon, so, while I agree that it is highly desirable to support home industries, it seems rather ridiculous to suppose that benzole can seriously compete with petrol when the present high prices are charged for it.

Benzole used alone makes the average engine run very dry and, from my experience, certainly does not give 15% extra mileage as stated in the above-mentioned letter. It certainly does prevent knocking, but I think it is generally agreed that good petrol is superior in almost every way. Let the National Benzole Association place benzole on the market at, say, 2s. per gallon, and then they would get support from the motoring public; but, while the present price is charged, I cannot see what advantage there is in using it. A.F.S.

Edinburgh.

FOUR-STROKE V. TWO-STROKE.

Sir,—Riders of two-stroke machines will hardly feel disposed to accept "R.N.'s" terse summing up of the pros and cons of two-strokes and four-strokes. In the first place, the oil consumption of two-strokes fitted with good drip feed lubrication systems (as most of the well-known makes are) is not bad, or, at any rate, not worse than that of equivalent four-strokes.

Secondly, the "consumption of plugs" of "average two-strokes" is *not* "absolutely abnormal." Possibly the number of types of plugs that can be depended upon to work satisfactorily under any conditions is more limited than in the case of four-strokes; but once the best type of plug has been found (merely a matter of a little experiment) any tested specimen of that type will stand up to its work quite as long as any four-stroke plug would.

Personally, I ask for a four-stroke every time, but not a 2½ h.p. four-stroke. In the small sizes the good two-stroke always more than holds its own. What has led to a certain amount of prejudice against the two-stroke is that some "cycle and gramophone" experts, whose capabilities of workmanship (not to mention design) did not rise to the manufacture of a four-stroke engine for their assembled motor cycle, considered the two-stroke an easy solution of the difficulty, especially as the cost of production was considerably lessened thereby. The old indictments of the two-stroke hold less and less every day. REVS.

Sir,—As a two-stroke enthusiast, I feel bound to reply to "R.N.'s" letter in *The Motor Cycle* of June 5th. A good two-stroke does not require decarbonising until after 1,000 miles. Owing to its simplicity, a two-stroke can be taken down and decarbonised in a far shorter time and with greater ease than a four-stroke.

In my opinion, a two-stroke scores over a four-stroke in every point except as regards maximum speed, fuel consumption, and mileage before decarbonisation is necessary. Its far superior hill-climbing capacity, much greater simplicity, smoother running (which results in less wear and tear for the transmission and tyres, and greater comfort for the rider), and lower cost more than make up for these disadvantages.

As regards overheating, "R.N." has ridden nine miles at an average of 31 m.p.h. on a 2½ h.p. four-stroke. A fortnight ago I rode from Woburn Sands to Dunstable (eleven and a half miles) in twenty minutes (an average of 34½ m.p.h.) on a 2½ h.p. Levis two-stroke. From Dunstable to St. Albans I kept up an average of over 30 m.p.h. There were no signs of overheating. D.B.C.

Newport Pagnell.

Sir,—In a recent issue there appears a letter over the initials of "R.N.," wherein the writer seeks to compare the merits and demerits of the four-stroke and the two-stroke motor cycle, and concludes by adding that the average person would pay £5 extra for a four-stroke.

Now, in reply to this letter, I should like to state that I have been a motor cyclist for a number of years, during which time I have ridden numerous makes, both four and two-strokes, and I am of the opinion that the choice depends upon the purpose for which one requires the machine.

With reference to "R.N.'s" analysis, I am prepared to take his statement, so far as four-strokes are concerned, as being correct, and will, therefore, only deal with the two-stroke.

	R.N.	Self.
Maximum speed	35-40.	38-42.
Reliability	Reliable.	Very reliable.
Fuel consumption	80-110.	100-120.
Oil consumption	Bad.	Good with B. & L. drip-feed.
Simplicity	Very simple.	Very simple.
Carbon deposit	Decarbonise every 600 miles.	Quite equal to a four-stroke. I have ridden my machine since 1915, and only had cylinder down once.
Starting	Easy to start.	Easy to start.
Overheating	Overheats very easily.	Does not overheat, in spite of severe tests. I have had no trouble in this respect.
Hill-climbing	Very good.	Very good.
Consumption of plugs	Abnormal.	No different to four-stroke. I have two plugs; one in use and one spare—both having been in use since 1915.

"R.N." also says that if one drive at over 25 m.p.h. any length of time the average two-stroke shows signs of tiredness, whereas his 2½ h.p. J.A.P. can do nine miles at 31 m.p.h. without distress. I might add I have done 38-42 m.p.h. for five miles without causing my engine any apparent distress, and, further, have ridden from Barrow, Lincolnshire, starting 4.30 p.m., stopping at Brigg for petrol, and arrived in Lincoln at 5.45 p.m., distance thirty-eight miles, returning the same evening.

With regard to the extra price for a four-stroke, I would not have one at any price having now tried a two-stroke, except it be a 6 or 8 h.p. twin for touring with sidecar.

I am not in the trade nor in any way connected with the makers of my machine, which is a Sun-Villiers.

EAST YORKS.

HUTCHINSON

"Yours very satisfied."

C . . . S . . . .

THIS is the strain in which all our customers testify their appreciation of Hutchinson's Tyres. It is an absolute certainty that, if you have not already done so, you will express your opinion in the same style when you have tried them.

Read what our correspondent says:

. . . . Edgbaston.

". . . . I fitted one of your covers 26 x 2½ to my back wheel on my combination, and I have pleasure to state that I have now covered

OVER 5,000 MILES

without having had any trouble whatever.

"I think that it is an exceptional performance when taking into account the bad condition of the roads to-day.

"I need hardly say that I don't expect a similar performance again, but I shall continue to use Hutchinson.

"Yours very satisfied,

"C . . . S . . . ."

"C. S." makes an error when he gives up hope of repeating this performance—by choosing the correct type of Hutchinson Tyre for your particular purpose you will be

SATISFIED ALWAYS.

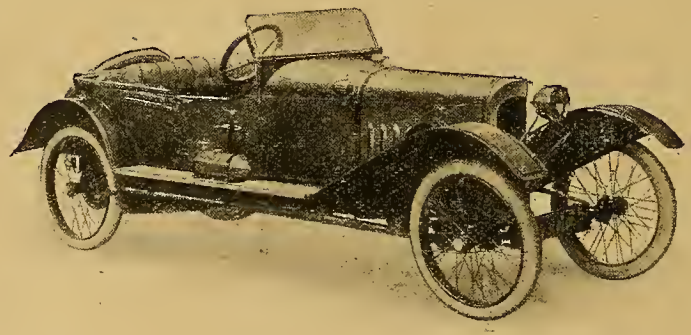
The G.N. Engine.



The G.N. Engine is an outstanding example of the vibrationless and successful air-cooled engine. It is, moreover, unique in its supreme accessibility. Its efficiency is shown by its hill-climbing successes and by its use for special purposes during the war, during which time several minor improvements were embodied.

Messrs. The G.N., Ltd.,
Etna Works, Albert Road,
HENDON, N.W.4.

A QUESTION.

Sir,—The answer to the Rev. J. M. Philpott is simple. Tickling the float gave a richer mixture, which the weak spark would fire. I had the same trouble in the Birmingham-Land's End trial. F.J.W.

MERCURY AS AN AID TO COOLING.

Sir,—I read with interest the letter of Major G. Madge, R.E., in *The Motor Cycle* of July 3rd. He suggests using mercury, cased in with copper or aluminium jackets, for cooling; the effect of mercury on aluminium is to form an oxide of aluminium, and on copper mercury forms an amalgam.

Mercury has little or no effect on cast iron. C.O.P.
Newcastle-on-Tyne.

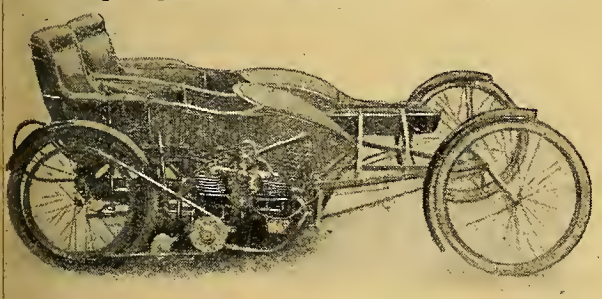
THE THEORY OF PETROL CARBURATION.

Sir,—I am no chemist, but a mere engineer, and would greatly appreciate it if your contributor on the above subject, Mr. H. J. Poole, would say if the values he calculates for the ratio of volumes of air to vapour for the various fuels are for an explosive mixture in each case or simply the air theoretically necessary for complete combustion.

Also, if he has the figures handy, could he state the density of the various vapours at N.T.P. in grams per litre or otherwise? ANGUS LOVE.

A SIMPLE CYCLE CAR.

Sir,—It may possibly be of interest to "W.A.M.," whose letter appeared on May 8th (and to other readers), to know that there is a cycle car, built by Breach of this town, on the lines he suggests and illustrates, already on the road. I enclose photograph of the machine. The engine shown



A lightweight cycle car fitted with a 2¾ h.p. flat twin engine.

is, as will be seen, a 2¾ h.p. air-cooled, fitted with three-speed gear and clutch. An extremely simple and ingenious differential is, I believe, being incorporated, which, it is claimed, will not add one ounce to the present weight, which cannot be more than that of a medium weight sidecar outfit.

Sidmouth. GARTHGOGO.

PILLION RIDING.

Sir,—I just want to endorse what "A Regular Flying Officer" said in *The Motor Cycle* of July 3rd *re* pillion riding.

I think it would be a great shame if pillion riding was prohibited, because it would mean disappointment for thousands of motorists who take their friends for a ride in the fresh air, and whose means will not allow them to sport a sidecar. If pillion riding has its dangers and is to be stopped, why not stop step riding on push bicycles? Surely it is as dangerous? In my opinion, there is no danger provided one is careful at cross roads and always prepared to stop. I have ridden over 1,000 miles with passenger on the back through towns and villages and everywhere, and never had a spill. In the accidents that have occurred how many can be proved that it was solely due to the passenger being on the back? I should like to hear what other motorists have to say *re* pillion riding. FAIR PLAY.

Sir,—I beg to disagree in every respect with "A Regular Flying Officer (Pilot)."

Motor cycle pillion riding is most dangerous, and acknowledged as such by those who indulge in this practice. I never give anyone a ride on my carrier if I can, in any way, get out of it. Every machine at various times gets into a tight corner, and the chances of escape are lessened if a passenger is on the back. The balance of the machine is totally upset, bigger swerves have to be taken, tramlines at acuter angles, the steering is slower, it is unresponsive to the brakes, and the driver's attention is constantly being taken (especially if the passenger is a new flapper).

On straight roads it may be safe enough, but at the slightest risk the chances of accident are, according to insurance companies, more than doubled. A. C. ROBBINS.

Sir,—The remarks of the general press, and even a portion of the motor cycle press, on pillion riding make me tired.

In spite of three years' active service as an aeroplane pilot—with some success—I had regarded myself as a normal every-day man, who gets "cold feet" at times, and overcomes the feeling when he can. Now, however, on reading a contemporary on pillion riding, I discover that I am nothing more nor less than a brave, dashing, fearless young hero, for have I not, since the age of fifteen, dauntlessly carried flappers, relations, broken down motorists, etc., galore for some thousands of miles without turning a hair, or even pausing to hesitate, in spite of the dread risk I was taking?

Do let us come down to commonsense. Pillion riding, with a novice steering, may be a trifle more risky than solo, but certainly not nearly so dangerous as the novice on a sidecar outfit, even though experienced in solo riding. I have never seen an accident due to pillion riding, though I have been with many in their first attempt; but I have seen—and been in—several with experienced drivers, due to the sidecar lifting when a sharper turn than anticipated was necessary, while with learners on sidecars accidents are legion. I have seen many due to the sidecar lifting, and one due to the driver forgetting existence of the sidecar, and trying to dodge through a 3ft. space in traffic! Yet no one runs down the sidecar as risky, so why try to interfere with the many thousands who find the carrier so useful and inexpensive? Let every man decide for himself as to whether anything he wishes to do is risky or not.

Luton. LIVE AND LET LIVE.

THE BIG FOUR.

Sir,—May we through the courtesy of your columns call attention to the misuse of the words "Big Four."

When some eight or ten years ago we first introduced the big single as a class apart from usual 500 c.c., we hit upon the term "Big Four" as a distinctive name for our particular engine. The term caught on, and, since then, "Big Four" has been understood to mean the *Norton* big single.

Now that we are no longer alone in the manufacture of this most useful size of engine, there is a tendency to designate all singles over 500 c.c. "big fours." This we consider not quite fair to us; "big four" *type* if you will, but there is only *one* "Big Four"—the Norton—and the term is one of our exclusive trade marks.

We wish to draw attention to this in order to avoid any misunderstanding or possible unpleasantness in the future.

NORTON MOTORS, LTD.

THE CHEAPEST MOTORING FOR TWO.

Sir,—Your contributor, "Car Driver," is rather sweeping in his comparisons between cycle cars and sidecar outfits.

He can know very little of cycle cars when he says that they "well lose in hill-climbing, petrol consumption, speed, first cost, taxation, and in difficulties of garaging." In only one particular is he correct, viz., taxation, and then only if his cycle car is a four-wheeler.

As a motor cyclist of five years' standing, I have only recently "discovered" the cycle car, and, when I look back on those "overalled, disreputable, up to one's eyes in dust or mud" days of motor cycling, I curse myself for a prejudiced ass.

What sidecar outfit can beat the G.N.'s performances at South Harting? Which one of equal h.p. can better its petrol consumption on the London-Edinburgh run? It is cheaper than a sidecar outfit just put on the market by exactly £17 10s., with exactly the same equipment; and, whereas on the one you could ride (as driver) 150 miles on a wet day and get out in the same state of cleanliness as you got in, on the other you would have to get yourself up like an arctic explorer or a sewer man.

Until I can get my G.N., I am content with my present "animated bathchair," despite its tendency to fall to pieces in detail and to bark my knuckles when the (so-called) starting handle slips, and wild horses would not drag me back to the best sidecar outfit ever dreamed of.

London. PRIVATE OWNER.

IN PRAISE OF THE HEAVY TWIN AS SOLO.

Sir,—Is not the pendulum swinging too much in favour of lightweights? I have ridden all sorts since the early Minerva days, and have never before experienced such road pleasures as with a recently purchased 8 h.p. Zenith. Its comparative silence—a purr instead of a chug-chug—its elasticity and acceleration, its hold of the road, and, above all, a charming sense of power in reserve for use on hills, and —should you care for that sort of diversion—dust-ups are pleasing points.

I have had its weight against me too, due to a short, which I could not diagnose. Pushing to a garage made one's forehead wet. Still, for the greater glory of its stride over lighter and less powerful mounts one is prepared to endure a good deal. The usual disclaimer. PA 4416.

Kingston-on-Thames.

A LESSON WANTED

Sir,—In a recent issue of the "Blue Un" a reader, John Scoble, says he takes himself, his wife, and two daughters, on his 3½ h.p. Sunbeam and sidecar; the machine being five years old. Again, I have sometimes read in your account of a test or trial, that the winner "managed his machine very cleverly."

Perhaps John Scoble, or some experienced rider, would be good enough, for the benefit of novices like myself, to give as accurate a lesson as possible how to get "all out" of a machine without damaging the bearings, etc.

For my part, I found a 3½ h.p. too low-powered to travel in comfort, without serious damage, such as loose bearings, and threatened seizure, loose fork head bearings, and even cracked cylinders (at the exhaust valve seat), and distortion of cylinder and piston, and I attempted only to take my wife—without any further passenger—less than twenty stone altogether, over average roads.

If these accounts are correct, what a bad driver I am, and what a lot I have to learn. I am perfectly serious in my wish to learn the best manner to drive a machine, say, over average roads, against a fifteen mile an hour wind, loaded up with rider, passenger, and luggage. Can the lesson be put in plain "figures," as it were? Can the amount of oil necessary, the *exact* gears, etc., be given?

One person travels further up a hill than another on the *same* scooter; how does he do it? I rush a hill—is this necessary or advisable?

My 3½ h.p. used to "konk"—why does Mr. Scoble's not do the same? TOP HEAVY.

HOT OR COLD INDUCTION?

Sir,—Our thanks are due to Mr. H. J. Poole for his clear and well reasoned showing of the need for heating paraffin carburetters, as based upon consideration of the vapour tension of petrol and paraffin.

May I, however, call attention to the prime importance of knowing the temperature involved when applying Mr. Poole's results to the conditions of the engine? It is very easy to be misled into the idea that if we start up an engine "all cold," say, at 16° Centigrade (about 60° Fahr.), that will be the temperature of the gas entering the cylinder, whereas, in point of fact, the temperature will be very much lower, except in the case of paraffin, which scarcely volatilises at all at this temperature. It is true enough that during the compression period in the cylinder the temperature may rise high enough to ensure theoretically complete volatilisation; but if the cylinder has been supplied with fuel that is only partly volatilised the time involved during compression is not enough to admit of complete conversion of liquid into gas, or it may be to admit of thorough mixing of air and gaseous fuel. The result is misfiring or failure to fire at all.

The case of benzole is not mentioned by Mr. Poole, and it is interesting because it comes between petrol and paraffin as regards volatility, and, as might be expected, does require induction heating in very cold weather, and is all the better for it at ordinary temperatures.

It would be of considerable interest to know the temperature of the gases in the induction pipe when No. 3 petrol is being used, for it appears to me to be highly probable that this would show, on Mr. Poole's results, the advisability of induction heating at cold or fairly cool atmospheric temperatures. One cannot help being impressed by the coldness of the induction pipe of the average engine, warmed though it generally is by conducted heat from the engine.

We know, as a fact, that it is much more difficult to get satisfactory starting in cold weather with the lower (less volatile) grades of petrol, and this can only, I think, be accounted for, with Mr. Poole's tables before us, on the assumption that the heat absorbed during evaporation so greatly reduces the temperature as to prevent anything like complete volatilisation.

I am sending you this note without any attempt to criticise Mr. Poole's observations, but as an attempt to show one of the limitations upon his results, which must be observed when it comes to the consideration of the less volatile fuels when used in cold weather.

What I want to emphasise is the great *amount* of heat which must be continually supplied to the fuel by some means or other to ensure complete conversion from the liquid to the gaseous state. J. H. LESTER.

ADVICE WANTED.

Sir,—I have been working all through the war, in conjunction with another lady, with a canteen of my own, and now that it is no longer required I am anxious to make use of it, and it struck me, if I could find a district in one of the Southern counties, which is much frequented by motor cyclists and motorists, that I might be of some service in providing general refreshments. Perhaps your readers would aid me by giving advice in this matter as to the locality where this might be required, as I am very anxious to start at once. A. M. HUME.

CHEAPER FUEL.

Sir,—I have been reading with no small interest recent articles which have appeared in the press on the qualities of benzole and other motor fuels; their cheapness and efficacy as compared with petrol itself, and I think that the following may be of interest to your many readers.

I am the first individual who ever succeeded in amalgamating petrol and paraffin. In August, 1916, I was granted a patent for a motor fuel which consisted of petrol and paraffin and other ingredients which, when properly blended, resulted in a perfectly homogeneous and harmonic substance capable of performing the best duties of pure petrol with less deteriorating effects on mechanism, and at a considerably lower cost. The fuel invented by me can be manufactured and sold much below the cost which you state is being charged for other petrol substitutes. The efficacy of my fuel is, I claim, unequalled. This patent has been eulogised and certified by the chairman and secretary of the Irish Automobile Club and other large users of petrol in this country, and I hold documentary proof of this fact. Owing, however, to the restrictions imposed on the use of the materials which were required for the manufacture of my patent by war conditions, I have been debarred till now from placing this important and revolutionising invention before the public.

Any of your readers who may require further particulars for the purpose of comparison with other advertised fuels will be gladly accommodated by applying to

A Journey Northward.

"I took myself by the metaphorical scruff of the neck last week-end, saying 'No, you *don't* go down south. Fresh fields and pastures new for you. This is the way, up the Finchley Road.' So that is how we were bubbling through Barnet at ten-thirty on a Sunday morning, 'admiring how the world was made' north of the Thames. . . . .

"Considering how very excellent (for these days) is the condition of the Great North Road, I wonder more motor cyclists don't use it. The day was a little overcast, it was true, and there was a westerly wind that would have ripped the teeth out of a power saw. . . . .

"Slipping along towards Baldock, I became aware of a slight singing noise that didn't oughter be there. It kept worrying me, though I peeped all over the machine, until I thought to glance behind me, when I saw a saffron skinned young Celestial—in fact a Chinese—mounted on a little —— I thought it was up to me to give the —— something to do, so we slipped along in nice style for ten or fifteen miles, respecting the ten-mile limits religiously, for the police coffers seem to stand in need of filling hereabouts. Wonderful how this little 'bus stuck to my tail, and I must say that Ah Sin was a devil on corners. The rain did not permit of our really hitting it up. . . .

"At Royston our ways parted, and I ran on alone over the Cambridgeshire flats, a raging typhoon of a wind trying to pick the machine up from under me, and jolly near succeeding. A lunch at a country pub near the town, and I slid into the clean streets of Cambridge. . . . The sun gleamed fitfully, but a gathering storm, looking very grim and grey to the south'ard warned me that I had better not linger. . . But this dodging storms is rather fun, and an appealing feature about the motor cycle.

"I evaded this one, and got back to Hatfield, where quite a few drivers were out. . . .

"The first notification I got that we had been a hundred and forty miles was that the big engine spat and coughed in an under-nourished manner near the Swiss Cottage." R. H. B.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Completing a Purchase.

Recently I viewed a motor cycle and also had a trial run. I deposited £1 on the machine with a view to purchase. Since then I have seen another machine, which I think of purchasing. How do I stand in regard to the first machine? Am I bound to purchase it, or simply lose my deposit?—F.W.Z.

Having paid a deposit on the machine, the vendor might lawfully insist upon you completing the purchase, but if you explain your inability to do so he might forego this. He will be justified in retaining your deposit.

B.S.A. Adjustments.

(1.) The clutch of my 1914 B.S.A. is too stiff, and will not give a proper free engine when out. How and where is this adjusted? (2.) The machine will not take full throttle and air, although it runs well on full air and half or threequarters throttle. (3.) The machine is fitted with a Best and Lloyd drip feed lubricator, and I cannot get this to work properly. I have had it out and cleaned it thoroughly, fitted a new washer to the plunger also, put new packing in the adjusting screw and pump rod, but still it goes down practically as soon as it is pulled up with the valve closed. (4.) Will you explain the working of this pump, as I do not understand the principle? (5.) Sometimes the oil fills up the glass, and does not get away. What is the cause? (6.) Are the B.S.A. valves interchangeable? (7.) What kind of bearings have the engine-shaft big end and gear box main shaft?—R.P.

(1.) A multiple-plate metal clutch needs thin oil to secure freedom. You will find the adjustment consists of a right and left-hand screwed sleeve on the clutch rod. (2.) Try varying the size of the jet by means of the adjusting screw between the throttle and air barrels on the top of the carburetter. (3.) You have apparently reassembled the oil pump of the drip feed wrongly, *i.e.*, with the spring above the washer, instead of below it. (4.) The pump is operated by depressing the plunger, which is returned by the spring beneath it, at the same time forcing oil through the drip feed valve. (5.) Probably the oil pipe is choked. If clear, make sure that the crank case release valve through the engine-shaft is working. (6.) The valves are interchangeable. (7.) The 1914 B.S.A. bearings are as follows: Engine main-shaft, ball; engine big end, plain. Gear box main shaft, ball (plain bearing in driven sprocket only operates on lower gears).

Timing 4 h.p. Douglas.

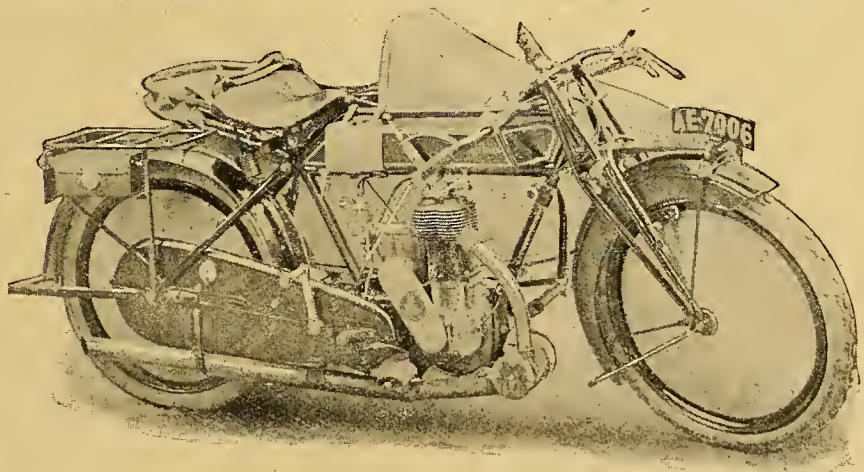
I have a 4 h.p. 1915 Douglas combination, and would be much obliged if you would answer the following questions. (1.) What is the correct timing for this machine, and should it be slightly advanced for speed work, solo? (2.) I use Castrol C oil, and I find my filter and sump covered with hard black ashes, and still there is plenty of oil in the sump—how is this? (3.) I find I cannot exceed 40 m.p.h., solo, with this machine. I have a 29 jet; would a larger jet improve the speed? (4.) I have a C.A.V. magneto, type 3U2, on this machine, and it has become loose on its base. Where are the screws situated which secure it, as I do not wish to disturb it unless absolutely necessary?—H.T.B.

(1.) In timing your 4 h.p. Douglas, rotate the engine until the piston is 8 mm. from the top of the compression stroke. Advance the ignition control fully and connect up the magneto drive when the contact breaker points are just about to separate. Fully advance the spark when travelling at speed. (2.) If the oil has been in the sump any length of time, it is advisable to clean it out. Reduce oil supply to front cylinder slightly. (3.) If the machine is not in very good tune, you will have difficulty in exceeding 40 m.p.h. Attend to above points, also grind in the exhaust valves, if pitted, adjust the tappets, decarbonise, and fit a slightly larger jet, say 31. (4.) The screws securing the magnets to the base-plate of the C.A.V. magneto are underneath—it is advisable to tighten these at once and to do this will necessitate removing the magneto from the engine.

Faulty Three-speed Hub.

I have a New Hudson combination, fitted with three-speed hub. When I get the engine running, putting in the clutch stops it immediately. The gears have not acted properly since I had them; the spindle which controls the gear has broken twice, and is at the present time broken. (1.) Is there any gear you can recommend, that I can have fitted? I must admit I am quite disappointed with hub gears. (2.) Will you give me your opinion about the Grado Multi gear advertised in your columns, and if you think it would be a suitable gear?—A.D.H.

The fact that your engine stops when you engage the clutch is possibly due to your attempting to start with the high gear in operation. As the gear seems completely out of adjustment, you should submit it to a competent repairer or to one of the firms who specialise on hub gear repairs. (1.) You could not fit any other gear without considerable structural alterations to your machine. (2.) In a fairly level district the Grado gear might suit your purpose.



A new Sunbeam owned by E. Kickham, the Bristo Sunbeam agent. A new type of spring fork is fitted to this model.

Speed Gear for Old Machine.

I have an old type Chater-Lea motor cycle frame, which has a round bottom bracket, and I find it difficult to purchase a two or three-speed gear box to fit it. (1.) Can I purchase a gear box to suit above frame? If so, what make? (2.) Will the Philipson pulley fit a 6 h.p. J.A.P. engine? (3.) Will above pulley act satisfactorily with sidecar and passenger, using above engine?—W.H.P.

(1.) The Bowden two-speed countershaft gear was made in a special model to suit the Chater-Lea type of bottom bracket. The makers' address is Messrs. Bowden Wire, Ltd., Victoria Road, Willesden Junction, London, N.W.10. (2.) The Philipson pulley would be quite suitable on a 6 h.p. J.A.P. engine. (3.) The pulley will be satisfactory for passenger work if you specified a heavy governor for this purpose when ordering.

Indian Carburetter.

I have a 5 h.p. Indian, and shall be glad to receive information as to the following. (1.) On opening the throttle the engine chokes, sometimes picking up again and at other times stopping, however slowly I open out. I have decarbonised, and there are no air-leaks; it starts on pilot jet, first kick. (2.) I should like to know how to adjust the level of the Indian carburetter; I see no other means than bending down the two arms which support the float.—G.T.

(1.) The difficulty you experience with your Indian carburetter is, apparently, due to the mixture being too rich when first opening on to the main jet. Try a further opening of the extra air inlet, or reduce the jet (fit a smaller one if necessary. (2.) The method you suggest is quite a practical way of varying the level.

Choice of a Gear.

(1.) I am overhauling a 1912 3½ h.p. fixed gear Rex, and should like to know something of the following gears: Mabon, N.S.U., and Philipson. Would they be satisfactory on my machine, and, as I believe them to be all of variable pulley action, is the belt in tension on all gears? Also what are their ratio limits? (2.) Is it a fact that Binks carburetters give *less* petrol consumption, also *less* speed and power? Would B. and B., Amac, or Senspray suit my engine better? (3.) With a good carburetter, what mileage should I get to the gallon, also what range of speed?—M.S.

(1.) Presuming that you intend your 3½ h.p. Rex for solo work, any of the gears will be satisfactory. The N.S.U. is a two-speed epicyclic gear with free engine, and will give ratios of 5 to 1 top, and 7½ to 1 low; the Mabon gear will involve more alteration in fitting, but gives a wider range, about 4½ down to 8 to 1. The belt is always in tension with this gear by virtue of the movement of the countershaft concentrically with the engine shaft, so tightening the belt on the lower gears. The Philipson pulley is automatically variable, with a range of 4½ to 6 to 1, and is a very flexible form of gearing. (2.) The Binks carburetter gives satisfactory petrol consumption, and may also be adjusted to give maximum power with very little sacrifice of economy. All the other carburetters you name are excellent, but varying results may be obtained from them according to the manner in which they are tuned and their suitability for your particular engine. When ordering a carburetter you should give dimensions of your engine to the makers. (3.) Solo, about 80-90 m.p.g., 8-45 m.p.h. on the level.

READERS' REPLIES.

Magneto Trouble.

I notice in *The Motor Cycle* of July 3rd that your correspondent "H.E.N." has trouble with his Dixie magneto. I have had some experience of this magneto on charging, etc., and motor cycles, and I think it possible that "H.E.N.'s" magneto is playing the same trick that I have suffered from in the past. This consists in sparking across from the (stationary) secondary winding on to the field magnets. It is a very elusive fault, but easy to cure by pressing or tapping the windings so that they stand as far away from the magnets as possible. If I remember rightly, this fault could be induced by careless erection of the magneto, and also, presumably, by damp or faulty insulation. If the magneto has a switch-wire terminal, as I think some patterns have, it would be worth while suspecting it as an alternative. The insulation is not always perfect, which allows the primary current to leak. Another failing from which I have suffered on Dixies is the platinum points not opening cleanly in one jump. Sometimes (when the mechanism is worn) they open about $\frac{1}{100}$in. or less, stay like that for a degree or two of rotation, and then open properly. This means that the primary current sparks across the points. Remedy, adjust points the $\frac{1}{100}$in. closer together.—W. WHATELY SMITH.

Misfiring.

Referring to the query from "F.J.W.," in the issue for July 3rd, relative to misfiring of his 8 h.p. Rex. Having ridden all models of this make, I think I can put him right. (1.) This is a common defect in 1914 twin models, which are fitted with U.H. magnetos, and is partly due to leakage of magnetism. In my case I was compelled to get a new magneto. (2.) If the carburetter is of the needle variable jet type, it may be due to the throttle control wire having stretched. (3.) The oil pipe should have a non-return valve fitted in the union at the base, which, if working properly and the sight feed dome and all joints are air-tight, enables the oil to drip automatically. The breather pipe, which should also have a non-return valve, must be kept wide open—in fact, better and cleaner crank cases result from fitting two of these.—L.V.B.

Questions for D.R.'s

I notice in your issue of 3rd inst., a reply from "D.R." to "A.W.G.M.'s" query about castor oil, and I should like to supplement his remarks in case it should be thought that the use of castor oil was generally approved by D.R.'s. I think most of us who gave the oil a careful trial will agree that its use is doubtful in a motor cycle engine. Much, of course, depends on the quality of the oil with which it is mixed, and, while the impression in some cases was that an improvement in the staying power of the engine had been effected, as a rule engines, I fancy, ran hotter where a large proportion of castor oil was used. Bearings almost invariably were found ultimately to have suffered. (Of course, material was very poor latterly.)

If "A.W.G.M." wants to try it, he will find a mixture of one part pure castor oil to from five to seven parts of good lubricating oil quite a high enough mixture—assuming that a mixture is effected. This will secure the required smell, but he will need a file with which to clean his crank case, etc.

As regards respirator tubing for grips, this also is open to objection. It retains the wet, and helps to keep the fingers cold. The canvas wears and the appearance is ragged. It necessitates removing the makers' grips, usually by putting a match to them, and it is rather thick for some hands. On greasy roads it cannot compare with a strip of old inner tube wrapped puttee-fashion round the grips.

These items were both regular D.R. ideas, and remind me of aeroplane plugs, 1914 footrests, cranked kick-starters to accommodate straight exhaust pipes, aeroplane elastic and rubber buffers in the forks, hub discs, etc., and the smile of the man with the old Bosch magneto. What times we had!—D.N.H.

RECOMMENDED ROUTES.

OXFORD TO WALLASEY.—J.H.W.

Oxford, Banbury, Warmington, Warwick, Kenilworth, Stonebridge, Coleshill, Lichfield, Armitage, Rugeley, Stone, Woore, Nantwich, Tarporley, Chester, Birkenhead, Wallasey.

YORK TO GUILDFORD.—E.D.C.R.

York, Tadcaster, Ferrybridge, Doncaster, Bawtry, Retford, Tuxford, Grantham, Stamford, Norman Cross, Alconbury, Eaton Socon, Biggleswade, Baldock, Hitchin, Luton, Dunstable, Tring, Chesham, Amersham, Slough, Windsor, Staines, Chertsey, Guildford.

NEWCASTLE TO PETERBOROUGH.—T.W.R.

Newcastle, Chester-le-Street, Nevilles Cross, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Colsterworth, Stamford, Wansford, Peterborough. Approximately 200 miles.

TAUNTON TO DUMFRIES.—T.M.

Taunton, Bridgwater, Highbridge, Redhill, Bristol, Stone, Gloucester, Tewkesbury, Worcester, Kidderminster, Bridgnorth, Hodnet, Whitchurch, Tarporley, Warrington, Ashton-in-Makerfield, Wigan, Preston, Garstang, Lancaster, Kendal, Penrith, Carlisle, Annan, Dumfries.

WORTH WAITING FOR.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles.

Proof!
Here it is—lots of it—proof of our oft-repeated claims for a Motor Cycle Service, satisfactory, personal, courteous, reliable!
Glance through these letters:—
"Your business method is most courteous and friendly, and we are very pleased and satisfied. It is the personal element that you put into the thing that makes dealing with you a pleasure."
"I am pleased to say that I have safely received machine and must say how pleased I am with it, and I am sure I have got a bargain. I thank you for the straightforward way you have dealt with me and I will do the same to you, and will always recommend your firm to my friends."
"In connection with the Combination which I recently purchased from you, I have now had it long enough and used it sufficiently to express an opinion on its value. I can only say that for the money value I gave for it I am quite satisfied and shall have no hesitation in recommending any of my friends to deal with you."
"I wish to record my great appreciation of the kind and courteous way in which you carried the business through, and I shall feel bound, if any friend of mine wishes to purchase a machine, to recommend them to Messrs. Laytons."
"The machine in question has been very satisfactory, and I shall always be pleased to recommend you to my friends."
Now don't you think we could help YOU? We KNOW we could!
Write us regarding A.B.C., Ariel, Blackburn, Enfield, Ivy, New Imperial, Norton, Sparkbrook, and Triumph Motor Cycles, and Hillman, Standard Singer, and Dawson Light Cars—We cordially invite enquiries.

EXCELSIOR, Peco 1916 2-stroke, 2¾h.p., Jardine 2-speed countershaft, hand clutch, all chain, perfect condition throughout; £45.—39, Clodeshall Rd., Saltley, Birmingham. [X6830

EXCELSIOR (American), latest model, 7-9h.p., dynamo lighting, 3-speed countershaft, coach sidecar, practically new; £155; good sidecar part exchange.—R., 5, Victoria Av., Streatham. [7882

1915 4½h.p. Coventry Excelsior Combination, Viceroy sidecar, 650×65 tyres, 3-speed, clutch, and kick, take 3 anywhere, stored 2 years, good order; £80, no offers.—Can be seen, 32, High St., Rusthall, Kent. [7750

AMERICAN Excelsior Combination, 7-9h.p., 3-speed, including lamps, horn, pillion, speedometer, hood, screen, spare tubes, tyres, chains, tools, etc., tip-top condition; what offers over £100.—Barber, 440, Fore St., Edmonton. [7311

5-6h.p. British Excelsior Combination, C.B. sidecar, new April, 1915, countershaft, 3 speeds, K.S., lamps, horn, speedometer, Amac, spares, tools, etc., mileage 3,500, splendid condition; best over £85.—13, Victoria St., Wolverton. [X7011

AMERICAN Excelsior Combination, 7-9h.p., 1916, 3-speed, clutch, kick start, Phœnix sidecar, tyres, and general condition as new, run 2,000 miles only, guaranteed perfect; £130.—Watson, 132, High St., Aldeburgh, Suffolk. [7365

1917 American Excelsior Combination, dynamo lighting, overhauled, re-enamelled and plated, new tyres all round, large sidecar, hood, screen, 2 lockers, spare tyre and chains; £140.—Ellis, 59, Hugh Rd., Stoke, Coventry. [X7131

Fafnir

FAFNIR 3½h.p. U.H. mag., B. and B. carburetter, 2-speed; ride away; £23.—Stokes, Burgfield Common, Berks. [7791

6-8h.p. Fafnir, w.c. engine, with clutch and gear box, and carburetter off cycle car; £25.—Reply, Box 2,358, c/o *The Motor Cycle*. [X6849

F.N.

F.N. 5-6h.p., perfect condition; £28.—150, Hermitage Rd., Finsbury Park. [7155

F.N. 4-cyl., any trial; £28/10.—Payne, 109, St. Leonard's Rd., Mortlake. [X6821

F.N. 4-cyl. 5-6h.p., 2-speed and free engine; 39 gns.—Nurton, 29, Montpelier Vale, Blackheath. [7131

F.N. 1914 Sportiog Model, fair condition, offers, any evening.—G. E. Childs, Parsonage Mill, Dorking. [7302

F.N., 4-cyl., Bosch, B. and B., dropped frame, overhauled, fast; best offer accepted.—58a, Tustin St., Old Kent Rd., S.E. [7475

F.N., 4-cyl., 1914, 5-6h.p., 2-speed, clutch, with wicker sidecar; offers over £55; Worcestershire.—Box 4,341, c/o *The Motor Cycle*. [X6903

F.N. 5-6h.p. Combination, coachbuilt, 2 speeds, lamps, Klaxon, splendid condition; £48.—65, Eccleston Rd., West Ealing. (Call after 5 p.m.) [7629

F.N., 4-cyl., 2-speed, clutch, kick start, semi T.T., large wide tank, low frame, re-bored, new pistons fitted; £69; worth £90.—633, Abbeydale Rd., Sheffield. [7345

F.N., 5-6h.p., 4-cyl., shalt drive, 2-speed gear, Bosch mag., 2 band brakes, 1919 B. and B. carburetter, lamps, tyres, and enamel as new, sound, and in tip-top order, starts walking; £58.—Sargeant, Silsey, Boston, Lincs. [7401

F.N., 4-cyl., fast, model combination, 2-speed, multi disc clutch, Bosch, shaft drive, kick starter, electric lighting, many improvements, special tools, semi T.T. bars, all in good condition; £70.—Lieut. Nicolas, Kippington Court, Sevenoaks. [7228

F.N. latest 5-6h.p model ever turned out by makers, complete, exceedingly smart combination, 4-cyl., waterproof Bosch, 2 speeds, multi-disc clutch, kick starter, enclosed shaft drive, dropped frame, lamps, speedometer; any severe trial; only 95 gns., worth 150 gns.; lightweight part exchange.—99, Shaftesbury Rd., Hammersmith. [7364

The "IVY" TWO STROKE

The Victorious Ivy

was introduced in

1908

was practically unbeaten in open competition for the three years

1911

1912

1913

winning over 200 medals, 5 cups, and 2 A.C.U. Certificates, **3rd in Junior T.T. (1913)**, and 1st Single Cylinder Home. In

1914

still victorious. Smallest two-stroke to survive T.T. Course, averaging over 30 m.p.h. "Motor Cycling" said, "The Best Performance of the two-strokes in Junior T.T." In

1915

competition suspended. The machines on the road winning golden opinions everywhere. And in

1916

1917

1918

our factory was solely devoted to war work. In

1919

manufacture resumed, unanimously voted the best two-stroke on the market.

MOTOR CYCLES FOR SALE.

Gamage.

3½h.p. Gamage, 3-speed, clutch, Bosch mag., speedometer, lamps, and generator and horn, running condition; 48 gns.—Box 4,359, c/o *The Motor Cycle*. [X7

Grandex.

2¾h.p. Grandex-Precision, B. and B. carburetter, magneto; unused last 4 years; perfect order; ride away; 29 gns.—Fowler, Stonham, Suffolk. [X69

Harley-Davidson.

HARLEY 7-9h.p. Khaki Combination, bought 191 £130, or exchange light car.—1, Kenlor Rd., Tooting. [76

ALLEN-BENNETT Motor Co.—1916 Harley-Davidson combination, beautiful condition; £145.—Royal Parade, London Rd., Croydon. [78

HARLEY 7-9h.p. Special Brooklands Model K, only one other in England, speed over 80 m.p.h. £110.—52a, Burghley Rd., near Tufnell Park Tube. [78

HARLEY-DAVIDSON, late 1917, combination, stored 1918, just had £20 overhaul, spare £135 cash.—Lt. Bayley, The Orchard, Eastcote, Middlesex. [75

HARLEY-DAVIDSON 1915 Electric Model, enamelled, condition as new; 110 gns.; sidecar required.—Broom, 77, Marylebone Lane (1st floor flat near Bond St. Tube, W.1. [73

1918 Harley-Davidson 7-9h.p. Combination, in excellent condition, lamps, spare chain, tools, etc., fast and powerful outfit; £160.—Williams, The Hollies, 118, High St., Connah's Quay, near Chester. [X68

HARLEY-DAVIDSON (1919 electric model), fitted 40 gn. sidecar, smartest turnout on the road, owner had delivery of car; no offers, £250.—Rogers, Carrisbrooke House, Smethwick, Birmingham. [X66

HARLEY-DAVIDSON Combination, 1917, standard mag. model, bulbous back sidecar, acetylene lamps, good Dunlop extra heavy tyres, done very little work; £130; trial here.—Hammond, Gammersgate, Middlebam, Yorks. [X70

HARLEY-DAVIDSON 2-speed 1914 Model, Mills Fulford sidecar, fully equipped, ready to ride away, very powerful, go anywhere; any trial given; can be inspected at any time; £135.—Arnold, High St., Gillingham, Dorset. [X67

1915 Sept. mag. Model 7-9h.p. Harley-Davidson Combination, head and sidecar lamps, hood, screen in splendid condition, re-enamelled, unused 2 years during war; 138 gns.—Ford, 132, Lillie Rd., Fulham, London, S.W. [71

HARLEY-DAVIDSON 7-9h.p. 1915 Combination, perfect condition, spare chains, speedometer, all accessories, very powerful, for sale 27th July, moving, no accommodation; £130; a bargain; go anywhere.—Blackburn, 2, Dudley Rd., Huddersfield. [X68

HARLEY-DAVIDSON Combination, late 1916, 3-speed, clutch hand and foot, electric light and horn, speedometer, luggage carrier, hood, screen, tyres perfect, looks like new, runs better; must be sold quick; 150 gns.—251, Rye Lane, Peckham, S.E. [X68

HARLEY-DAVIDSON Combination, 7-9h.p., 191 magneto model, hood, screen, speedometer, accelene lamps, luggage grid, spare valves, chain, tube etc., splendid condition, just overhauled; 110 gns., offers.—F., 28, Holmwood Gardens, Finchley. 'Phone: Finchley 1667. [77

HARLEY-DAVIDSON 7-9h.p., electrically equipped model, with special chassis for Harley-Davidson and body, complete with Easting wind screen, electric horn, tail, and sidecar lamps, electric horn, guaranteed brand new; delivery Saturday; best offer.—Bingham, 6, Elgin Mews South, Maida Vale. [78

1915 Harley-Davidson, 3-speed and kick start, with Swan sidecar, electric head, tail, and sidecar lights, new Clincher tyre on back, and Good year on sidecar wheels, new chains, speedometer; overhauled and greased 12 months ago, not run since; can be seen and tried any time; £125.—Mr. S. Keal, Moor Rd., Rushden. [X67

HARLEY-DAVIDSON, 1915, 7-9h.p., perfect mechanical condition, with 1917 double sprung Montgomery sidecar, wind screen, mudshields, Klaxon horn, Jones trip speedometer, clock, 2 P. and H. lamps, and Lucas rear light fed by small car generator, spare cover, tools accessories, and spare parts, special large luggage carrier and swag bag, stored 2 years; highest offer.—30, Dover ton Av., Streatham Hill, S.W.2. [73

Hazlewood.

1917 Hazlewood Combination, 6h.p., 3-speed, clutch, K.S., complete with tools and lamps 24, New Borough, Wimborne. [77

5-6h.p. Hazlewood and Sidecar, Jap engine, Bosch B. and B., 3-speed, kick start, nearly new; £1 —295, Whitehorse Rd., Croydon. [77

Henderson.

HENDERSON 1916 8-10h.p., 4-cyl., 2 speeds, clutch Cancelet sidecar, accessories; 150 gns.—5, Victo Av., Surbiton. [78

LANCASHIRE, Cheshire, North Wales, and Isle Man.—Enquiries for Henderson 4-cyl. invited Blake and Co., Official Dealers, Liverpool-Manchester [76

Tariffs.

AT present there is an *ad valorem* duty of 33⅓% on all motor vehicles brought into this country. The object of this duty is two-fold: to help pay for the war and to protect British trade. The latter is suffering from the effects of the titanic struggle of the last five years, from the difficulty of getting material, and from the disinclination to work, which is resultant from the past years of strenuous effort on the part of those who helped to win the war at home. The British motor cycle trade has not yet settled down to production, and until it has it would be obviously unfair to allow foreign countries, which have not suffered from the war as we have, to capture our home markets. Whether or not it is advisable to tax the importation on all foreign-made vehicles for all time is not for us to say, as this journal is not political. The question whether this 33⅓% duty should remain in force till 1920 has recently been discussed in Parliament, although Mr. Austen Chamberlain, in introducing the Finance Bill, proposed that the present prohibition on the importation of motor vehicles should come to an end in September next. After a long debate, however, it was decided that the existing tariff should continue till May 1st next year. Several points of view were argued. The free traders moved the amendment to abolish the tariff this year; others, to improve foreign exchange, sought to prohibit the importation of foreign-made motor vehicles altogether; while the tariff reformers thought that the tariff should remain. As matters stand now, the importation of motor cycles made abroad will be free in the spring of next year, unless the Board of Trade, as it has power to do, prohibits foreign-made motor cycles from entering the country; and before May next year the Chancellor of the Exchequer may have something to say regarding the matter. It is evident then that the position is not certain; and, at the conclusion of the recent debate on the subject in the House, Sir Donald Maclean said: "The issue is left in a very muddled condition." We entirely agree, and the sad part of it all is that the British manufacturer, who needs all the help and protection he can get until his house is in order, is left unable to formulate a definite plan of campaign until the Government decides what it is really going to do.

Scooters—Trials and Definitions.

THERE is no doubt that great interest will be taken in the open scooter trial which the Auto Cycle Union has decided to promote in October next. This will be the first official trial of the newest form of motor vehicle, and it will take place in the London district. Scooters have not figured in competition to any great extent so far. There were three in our Staff Trial on Edge Hill, and one put in an appearance at Stile Cop. Last week's trial for lightweights, which was to have included a class for scooters over a somewhat ambitious course, did not take place; and, in the opinion of many good judges, a scooter must be more powerful than is desirable, and be possessed of a change-speed gear.

Therefore, since scooters are beginning to make their appearance in competition, a limiting definition becomes desirable, and the A.C.U. proposes the following: A motor scooter is a motor cycle having: (*a*) A platform not more than six inches from the ground, the centre portion of which platform shall, for not less than twelve inches in length, be the uppermost portion of the frame; (*b*) an engine, the cylinder capacity of which shall not exceed 200 c.c.; (*c*) no pedals for propulsion; and (*d*) a maximum weight, not including fuel, oil, or water, of 60 lb.

A scooter, then, is limited in three ways: in construction, in engine size and consequently horse-power, and in weight. The question of fitting a saddle or not is left with the designer.

THE ITALIAN GRAND PRIX.

British Machine wins the Junior Race of Sixty-two Miles. Italian Flat Twin makes Fastest Lap Time.

FOR the second time a Douglas 2¾ h.p. machine won the 350 c.c. race in the recent Italian Grand Prix, while the fastest lap in the 500 c.c. class was also accomplished by a flat twin. The Douglas was ridden by Baj. Badino, who rode a similar machine in the last T.T., and, in addition to the Turin Municipality Trophy, is awarded the regularity prize by having a minimum difference of time between each lap.

The winner of the 500 c.c. class was Bordino, who rode a Motosacoche, and the regularity prize goes to Gianoglio on a Fongri, who also made the fastest lap time. The Fongri machine is an opposed twin of Italian manufacture, having a cubic capacity of 575 c.c. on the standard models; it has side-by-side valves placed on the top of the cylinders and operated by a single camshaft.

Several other new Italian machines were in the race, including the twin-cylindered Della Ferrera, with a 500 c.c. engine having cylinders 68 mm. bore and stroke, and the Bianchi, with a V twin of 60×88 mm.

The results are as follow :

500 c.c. Class.

1.	Bordino (Motosacoche)	1h. 6m. 50⅖s.
2.	Acerboni (Frera)	1h. 17m. 30⅖s.
3.	Gianoglio (Fongri)	1h. 21m. 53⅕s.

350 c.c. Class.

1.	Baj. Badino (Douglas)	1h. 27m. 1⅘s.
2.	Maffeis (Maffeis)	1h. 27m. 17⅖s.
3.	Bonasso (Douglas)	1h. 43m. 2⅖s.
4.	Antoniazzi (Douglas)	1h. 47m. 39s.

The Biella-Oropa Hill-climb.

Another Italian classic motor cycle event is the Biella-Oropa seven mile hill-climb, which was held recently between Biella (the Italian Manchester) and the convent at Oropa, a hill 3,870 feet above sea level, the length being seven miles. The results of the various classes were as follows :

Meldi (Borgo), who made fastest time of the day at the Biella-Oropa event.

Acerboni (Frera), winner of the 500 c.c. class, Biella-Oropa hill-climb.

350 c.c. Solo.

1.	Maffeis (Maffeis)	14m. 1s.
2.	Bonasso (Douglas)	16m. 37⅖s.
3.	Saino (Douglas)	18m. 57⅖s.
4.	Minetti (Douglas)	28m. 53⅖s.

Maffeis, winner of the 350 c.c. class at the Italian hill-climb

500 c.c. Solo.

1.	Acerboni (Frera)	13m. 0⅕s.
2.	Carughi (Frera)	14m. 39⅘s.
3.	*Della Ferrera (Della Ferrera) ...	16m. 32⅖s.
4.	Crosa (Triumph)	17m. 5s.

750 c.c. Solo.

1.	Meldi (Borgo)	12m. 12⅖s.
2.	Dogo (Della Ferrera)	14m. 40s.
3.	Berutto (Triumph)	16m. 56⅘s.

1,000 c.c. Sidecar.

1.	Merlo (Frera)	15m. 22⅕s.
2.	Galloni (Frera)	17m. 31⅖s.
3.	Cremona (Frera)	19m. 9s.

*Fell at start.

The best time of the day was made by Meldi (Borgo), in 12m. 12⅖s., which, however, does not beat his previous record (made in 1914) of 11m. 15⅖s.

Some New Machines.

The Maffeis machine, winner of the 350 c.c. class, has a J.A.P. V twin racing engine, with overhead valves, and a chain-cum-belt drive through an Albion two-speed gear. The engine dimensions are 60×60 mm. bore and stroke.

The Frera is a standard 3½ h.p. model, single-cylinder, 85×88 mm., side-by-side valves, and chain drive through countershaft three-speed gear.

The machine, however, which is most eagerly awaited by the buying public is the Fongri. This is a 4 h.p. flat twin following the lines of the Douglas engine, equipped with three-speed gear, enclosed chain transmission, hand-controlled clutch, and kick-starter. The frame and spring forks, however, are not in accordance with English ideas, since the former is constructed of bent tubes and the latter are the usual Italian pattern.

ITALIAN ROAD RACING.

In the report of the first important post-war road race in Italy which appeared in our issue of July 3rd the second man's time was stated to be 3h. 56m. for the course of 225 kilometres, but we are now advised from Rome that Tuccimei (Triumph) actually completed the distance in 3h. 45m., being thus only 9m. behind the winner.

OCCASIONAL COMMENTS

BY "IXION"

Profiteering by Amateurs.

THE riders who denounce rampant profiteering should not forget that it is by no means confined to agents and people in the trade. For example, I hear of a 1919 Morgan, which has already changed hands four times, and on each occasion at an increased price. Moreover, another private owner of a post-war Morgan unloaded his bargain at a profit of £55 after a fortnight's ownership. We cannot suspend the eternal laws of supply and demand.

Pillion Riding.

I AM perhaps a little biassed against pillion riding for two special reasons. The first is that I have seen some good friends seriously hurt by the practice. It is a horrid spectacle, for when balance is lost in an emergency, the driver loses control very suddenly and very completely. He is instantaneously overmastered by the misplaced centre of gravity, and cannot save himself, but is hurled helplessly across the road. His passenger is in even worse case, and usually hits the road hard with the back of his or her skull. Few people who have seen such smashes—and I have seen three at close quarters—would wish to continue the practice. My second bias arises from the fact that the flapper bracket is not, and never has been, my sole means of taking a companion on my runs. If I never enjoyed the use of a cycle car, sidecar, or light car, it is conceivable that I might face the risks of putting a companion in peril. Quite apart from this, frank bias, I should wish to see pillion riding prohibited. It is technically absurd. A doubly-laden two-wheeler handles quite nicely under normal circumstances; but its centre of gravity is hopelessly and dangerously misplaced, and the results are patent in any imbroglio. When the machine skids or bumps badly, or has to be twisted sharply in a tight corner, or braked abruptly, trouble looms up quickly; and the false balance may convert what should be nothing more than a minor anxiety into acute danger. Secondly, the pillion rider does not merely risk his own neck: machines so laden are peculiarly uncontrollable when balance is once lost, and an innocent motorist passing by may be burdened through life with the memory of having killed a fellow creature. On two occasions pillion riders have crashed almost immediately beneath my head lamp, and I have narrowly escaped running into them. In one of these incidents, the pair skidded on a greasy patch just ahead of me at ten miles an hour; in the other incident, they were scrapping at an illegal speed to overhaul my machine, and fell over just as they had passed me. To quote other examples, I know of such riders coming over on meeting a traction engine unexpectedly in narrow lanes, and upsetting whilst overtaking a motor char-à-banc on second-class roads. The solo rider usually retains some control of direction when a fall or collision of some kind has become inevitable. The pillion riders often lose control completely when things go wrong. These are substantial reasons in favour of the abolitionist case. I am just at the age when one suspects one's self of grandmotherly tendencies; but surely there is not one solitary word to be said in favour of flapper-bracketing except that it is uncommonly cheap while it lasts.

Wanted, a Waterproof Glove?

I LUNCHED the other day at a popular hotel on a favourite motoring road. The morning had been stormy, and numerous riders sought shelter and a meal. Their riding attire was grossly unsuitable in many cases, probably because the morning had opened with sunshine, and they had been caught napping. But I noticed particularly that there was not a single pair of waterproof gloves between the lot of us. Of course, this is a perennial problem. Prior to the war, I knew exactly two makes of gloves which would keep out a drencher. One was the Continental rubber type (of Hun manufacture, one imagines?). A good glove, dear to buy, not over warm in December, and apt to perish rapidly if oil attacked it. The other was the Asbestol, made of hide too thick for the delicate control of a motor cycle. If anybody knows of another, many readers will be interested.

The Fouling of Sight Feeds.

THE other week I described in exaggerated and quasi-humorous fashion the difficulties of watching the oil drip through the average sight feed glass. There are, of course, three main causes for this trouble. If the device leaks at any joint, oil is apt to film the outside of the glass, dust settles on the oil film, and periodic cleansing is the obvious remedy. Secondly, if a full charge is rushed through the glass by opening the drip and pushing down the handle of the force pump, the whole interior surface of the glass becomes oily, and perhaps capillary attraction encourages the fouling under certain conditions. Thirdly, and most common of all, the blow-back from the crank case spurts oil over the interior surface. A reader has cured the last tendency on several machines by enlarging the release valve which is intended to relieve the crank case compressions. This may be done by fitting a larger valve, or by adding a second standard valve. Alternatively, it might be possible to obviate the nuisance by fitting a very light check valve between the drip feed and the crank case, in which case the valve should be so light that the weight of a few drops of oil would open it. The consequences of a stuck check valve might become so serious that an effective crank case release valve is certainly preferable. The fact that many manufacturers ignore so simple a remedy indicates how carelessly some machines are designed, or perhaps that few people take drip feeds seriously.

THE IRISH END-TO-END TRIAL.

Motor Cycle Union of Ireland (Ulster Centre) holds Successful Two Days' Trial.

THE decision of the Ulster Centre of the M.C.U. of Ireland to make the End-to-end trial a two-day event was generally appreciated. The course is upwards of 500 miles, and to cover this distance without a rest, especially on Irish roads, is by no means a holiday.

Thirty-two riders entered for the event, including many competitors from England, and the spirit of *camaraderie* displayed by motor cyclists from the North and South of Ireland and from the sister island of Great Britain was a very pleasant feature of the competition.

The entries included the following:

W. J. Chambers (6 A.J.S. sc.)
T. J. Woods (4¼ B.S.A.)
T. V. Murphy (7 Matchless sc.)
Frank McDonagh (4¼ B.S.A.)
W. J. Lake (3¾ Scott).
Jas. Browne (2¾ Douglas).
Geoffrey Boyton (4 Douglas sc.)
D. O'Connor (4 Douglas sc.)
Tom Mallon (3½ Sunbeam).
Wm. Downling (3½ Rover).
Jas. Stewart (3½ Douglas).
T. C. de la Haye (3½ Sunbeam).
A. Carton (7-9 Indian sc.)
A. G. Cocks (2½ Clyno).
Thos. Hall (4¼ B.S.A. sc.)
Maj. A. H. Waters (2¼ Triumph).
F. A. Newell (2¾ Douglas).
R. S. Russell (2¾ Sunbeam).
Thos. Stewart (4 Douglas sc.)
Jack Healy (3½ Norton).
"Sou'-Wester" (3½ Douglas).
Jas. Boston (3½ B.S.A.)
J. Dias (3½ P. and M.)
W. Wilhelmij (8 Matchless).
W. B. Gibb (2½ Douglas).
F. Ball (2½ Douglas).
R. W. Moffatt (3½ Douglas).
E. Clarke (4 Douglas sc.)
T. R. Popham (6 Enfield sc.)
S. J. Redmond (7-9 Indian sc.)
M. J. Doyle (7-9 Indian sc.)
R. Jones (4¼ B.S.A.)

Only three competitors failed to start from Rock Island coastguard station on the first day of the trial. These were Lake, Redmond, and Wilhelmij. Although cold and dull, the weather was dry when the first competitor started off for the opposite end of Ireland. The route lay by the way of Kenmare and Killarney, where there was a breakfast stop of threequarters of an hour. By this time the weather had broken, and from Glengarriff the run was in a regular downpour. Gowlane, the test hill of the day, did not prove too severe for the majority of the competitors, including Maj. Waters on his Baby Triumph.

Between Killarney and Rathkeale the roads were very bad, and the trouble with straying horses, cows, and pigs, not to mention hens and other fowl, was considerable. At Abbeyfeale the weather cleared, and the remainder of the run to Dublin was under better conditions. The luncheon stop was at Cashel.

The following did not check in on time at Inchicore at the end of the first day:

Geoffrey Boyton (4 Douglas sc.)
D. O'Connor (4 Douglas sc.)
A. Carton (7-9 Indian sc.)
Jack Healy (3½ Norton).
Jas. Boston (3½ B.S.A.)
J. Dias (3½ P. and M.)
T. R. Popham (6 Enfield sc.)
M. J. Doyle (7-9 Indian sc.)

The Second Day.

The second stage of the trial began at 6.30 next morning, the route taking in Swords, Balbriggan, Drogheda, Dunleer, Castlebellingham, Dundalk, Newry, Banbridge, Moira, Crumlin, Larne to Fort William Park.

On Iscar Hill was held a flexibility test, the first section being a slow climb, the second fast, and the third a non-stop run to the top. Of the twenty competitors to reach the foot of the hill only six made a clean ascent. These included Chambers, de la Haye, Cocks, Gibb, and Moffatt.

The following competitors finished the run:

W. J. Chambers (6 A.J.S. sc.)
T. J. Woods (4¼ B.S.A.)
Tom Mallon (3½ Sunbeam).
Wm. Downling (3½ Rover).
T. C. de la Haye (3½ Sunbeam).
A. G. Cocks (2½ Clyno).
Jas. Stewart (3½ Douglas).
F. A. Newell (2¾ Douglas).
R. S. Russell (2¾ Sunbeam).
Maj. A. H. Waters (2¼ Triumph).
Thos. Stewart (4 Douglas sc.)
"Sou'-Wester" (3½ Douglas).
W. B. Gibb (2½ Douglas).
T. V. Murphy (7 Matchless sc.)
M. J. Doyle (7-9 Indian sc.)
R. Jones (4¼ B.S.A.)
Jas. Browne (2¾ Douglas).
Thos. Hall (4¼ B.S.A. sc.)
R. W. Moffatt (3½ Douglas).
Frank McDonagh (4¼ B.S.A.)
F. Ball (2¾ Douglas).

Results.

Although not yet confirmed by the committee, the following may be taken as the probable prize winners:

Palmer Trophy.—W. J. Chambers (6 A.J.S. sc.)
Second Prize.—T. W. Moffatt (3½ Douglas).
Third Prize.—W. B. Gibb (2¾ Douglas).
Fourth Prize.—De la Haye (3½ Sunbeam).
Team Prize.—Douglas team (No. 1): Moffatt, Ball, and Gibb.

Scene at the finish of the Irish End-to-end trial last week. Eight Douglas riders between them secured the team prize, the Lindsey special prize, two cups, and four silver medals.

Automobile Association General Meeting.

THE fourteenth annual general meeting of the Automobile Association and Motor Union was held on the 23rd inst. at the Savoy Hotel, London.

In moving the adoption of the annual report, the president, Mr. W. Joynson-Hicks, M.P., reminded members that this was the first report after the conclusion of the great war, and would foreshadow the future expansion of the Association's activities.

He went on to say that nearly the whole of the patrols were on the road again, and, in addition, the road telephone system was being greatly extended; also the special mechanical first-aid sidecar outfits would be made increasingly available.

Membership was going up by leaps and bounds, the record week in their history being one during last month, when 1,753 new members were elected. Every hope could be entertained of attaining a six figure membership by the end of the year, and to keep this membership it was realised that value for money must be given.

The question of home-produced fuel was receiving great attention, and a special sub-section had been formed to encourage the production of benzole at the gasworks throughout the country.

The Ways and Communications Bill, now before the House of Lords, had also been watched with attention, and he believed that, when the Bill went through, the road organisations and users would not find that they had been ignored.

The report was unanimously accepted, and Mr. McWhirter, chairman of the Finance Committee, thereupon moved the adoption of the accounts. The balance-sheet and report for the past financial year showed a surplus of income of £7,420, which compares with the previous year of £24,374, the additional activities roughly representing in cost the difference between these two amounts.

SOME USEFUL HINTS TO COMPETITION RIDERS.

THERE is no doubt that many clubs could obtain very useful lessons from the cheery sportsmen associated with the Edinburgh M.C. Campbell McGregor, the secretary, who organised the Scottish Six Days', leaves nothing to chance, and instructions to officials are always clearly set forth in a four-page leaflet as are the duties of observers from start to finish. In addition, McGregor gives each competitor a letter setting forth his "fourteen points," and the phraseology of these illustrates the spirit of the trial which makes the Scottish event so enjoyable. These are as follow:

Read before Destroying.

All judges and observers act in an honorary capacity. You can help them by

1. Remembering that when an official asks you to remove your machine to a certain place, he is not doing so for practice.

2. Remembering that checkers' watches do not always agree—we know that as well as you do.

3. Remembering clerical errors sometimes arise, and when the mistake is ours it will be rectified.

4. Remembering that this year there will be an official investigation of all complaints—an "O.C. Complaints," who will have his instructions from the judges. If the fault is ours, we rectify it; if the fault is yours, we do not. You will have a right, of course, to insist on seeing the judges, but, if the case is adversely reported on, we think you will be wasting the judges' time by insisting on seeing them. The judges do not mind wasting their time, but they would hate to think that they were wasting yours.

5. By remembering that before you can put in a complaint, you must fill up a form. We will give you as many forms as you wish.

6. By remembering that if you are baulked on a hill, the failure does not count against you if you can restart. Your complaint is of no avail unless you produce evidence. We like to know the names of these baulkers (they exist in every trial), and they will start last.

7. By remembering that we do our best as regards arrowing. That's all!

8. By remembering that if you are not ready to start at the appointed hour, you are late. You may curse the hotel porter, but please do not curse us!

9. By remembering that this is a sporting event. The rules will be adhered to. If there has been a direct contravention of the rules, such as failing on a hill, not even your silkiest tones will help you.

10. By remembering that our organisation can quite easily cope with any irrelevant or unnecessary complaints.

11. By remembering that we have no desire unjustly to do you in for your gold medal. If you win it, good and well. If you lose it—well, the fault is yours.

12. By remembering that you are only one per cent. of the total competitors. The other ninety and nine are entitled to consideration. They will have ours. Give them yours also.

13. By remembering that each check stands by itself.

14. By remembering that it is easier to check the cards when you run to the time stated on your card, and try and keep the card legible.

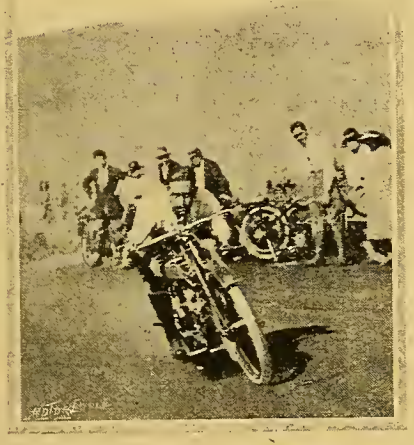
HILL-CLIMBING IN SOUTH AFRICA.

PARTICULARS are just to hand of a successful hill-climbing contest organised by the Natal Motor Cycle Club on May 31st. The Inchanga Bank Hill-climb for the Shimwell Trophy attracted a good entry, and it is encouraging to note that in the solo classes none other than British machines were entered.

The Inchanga Bank is about 30 miles from Durban on the Durban-Maritzburg Road; it rises 700 feet in 1,800 yards and has six bad corners.

The sidecar class was won by Dales (Harley-Davidson) in 1 min. 52 secs.

On formula, the solo class proved a scoop for the 2¾ h.p. Douglas, riders



F. A. R. Zurchar (2¾ h.p. Douglas) winning the Shimwell Trophy at the recent Natal hill-climb.

of this mount taking first, third, fourth, fifth, and sixth prizes. The second place and fastest time went to a big four Norton.

The formula positions and times were as follows:

		M.	S.
1.	F. A. R. Zurchar (2¾ Douglas) Shimwell Trophy.	1	46⅘
2.	A. Morcom (4 Norton) ... ... Morcom Trophy.	1	56⅘
3.	C. Dowse (2¾ Douglas)	1	56
4.	A. J. S. Ford (2¾ Douglas) ...	1	54
5.	P. Riequeburg (2¾ Douglas) ...	1	54
6.	T. Handley (2¾ Douglas) ...	1	58
7.	R. Shuzor (Rudge)	1	47⅘
8.	Young (Triumph)	1	41
9.	Harris (Triumph)	1	43⅕
10.	Kenion (Rudge)	1	50

Twenty started and fifteen finished. There were numerous tumbles on one particularly bad corner. The winning Douglas is a well-known mount several years old which has been successful in many past events, and continues to give excellent service.

CO-OPERATION IN OVERSEAS TRADE.

FOR several years we have advocated that British manufacturers appoint direct representatives abroad, and more than once have suggested that a practicable scheme might be arranged by which several firms with non-competing goods could co-operate. We now learn with pleasure that a number of Midland accessory manufacturers have combined to form the Associated British Manufacturers' Syndicate, with the idea of developing trade in Canada and North America. These firms include the Sphinx Manufacturing Co., Powell and Hanmer, Terrys of Redditch, Accles and Pollock, Benton and Stone, Ltd., Abingdon-Ecco, Ltd., W. and A. Bates, Rotherham and Sons, and the makers of the Amac carburetter.

Capt. S. A. Rowlandson, late R.A.S.C., has been appointed to the important position of general manager, and will shortly sail for Canada, where wholesale depots will be opened in some of the leading cities, such as Montreal, Toronto, Detroit, and possibly Vancouver.

Capt. Rowlandson is well known in the motor cycle world, and before the war was seen in all the important competitions on a Rudge motor cycle. We recently had the pleasure of a chat with him, and learned that he is as keen as ever about motor cycles and their future prospects. He intends to take a machine with him to Canada.

READERS' ROAD REPORTS

THE following report of road conditions in the North of England and Scotland forwarded by readers will doubtless be of interest to other motor cyclists:

Southport to Preston: Good.

Preston to Carnforth: Excellent.

Carnforth, *via* Kendal and Shap, to Penrith: Good.

Penrith to Carlisle: Excellent.

Carlisle, *via* Langholm, to Hawick: Good.

Galashiels to Edinburgh: Excellent.

Hawick, *via* Selkirk, to Galashiels: Good.

Stirling to Crieff, *via* Dunblane: Good.

Dunblane *via* Amulree Hotel, to Dunkeld: Good, except near Amulree, this being rather rough.

Edinburgh to Stirling: Excellent, except through Linlithgow and Falkirk; very bumpy.

Dunkeld, *via* Pitlochry, to Killiecrankie: Excellent.

Killiecrankie to Kingussie: Poor; very bad, loose stones Blair Atholl to Dalwhinnie.

Kingussie to Inverness: Fair.

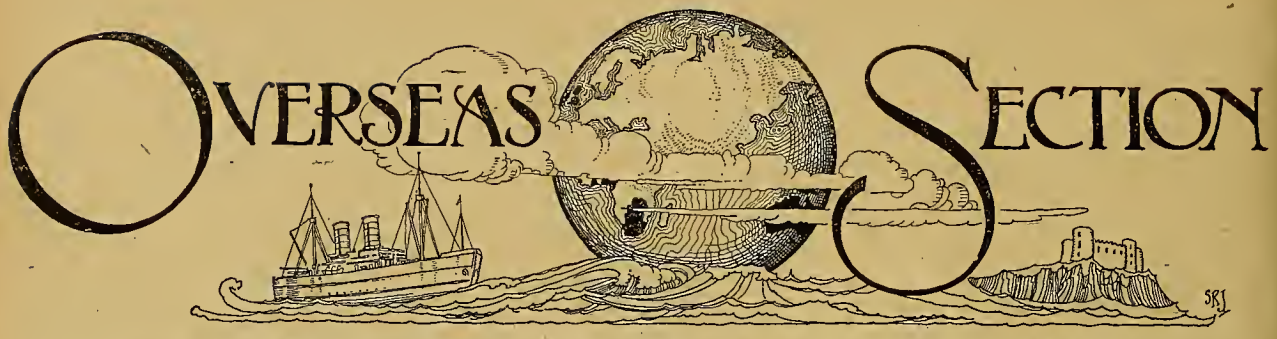
Inverness to John-o'-Groat's, *via* Dingwall, Bonar Bridge, Helmsdale, and Wick: Very good, except for five-mile stretch near Bonar Bridge spoilt by timber-hauling.

John-o'-Groat's to Thurso: Very good.

Thurso, *via* Forsinard, to Helmsdale: Bad; many stretches of loose and sharp stones.

Inverness to Fort William, *via* Fort Augustus: Fair, with several bad stretches of about five miles each, these being bumpy through timber-hauling.

Crianlarich, *via* Tarbet, to Dumbarton: Fair; bumpy in places.



A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Luggage Grids.

ONE of the greatest difficulties in sidecar touring lies in finding a suitably-sprung position for the necessary luggage, and particularly does this apply to the Overseas sidecarist, as, in addition to the personal equipment of himself and his passenger, it is generally necessary for him to carry something in the way of a tiffin basket, etc. Moreover, he is likely to encounter far rougher going than the tourist in the Old Country, so that his luggage grid, whatever form it may take, is of little use unless it be effectively sprung.

The most obvious position for the luggage grid is to attach it protruding from the back of the sidecar body, but this method presents difficulties, particularly if heavy burdens, including a tin of petrol, are to be carried. The sidecar springing, unless very much on the stiff side, will not stand the additional load, so placed that it obtains considerable leverage on the springs, and at all events the comfort of the passenger is likely to be upset by the limitation of the springing being reached when bad jolts are encountered. In other words, if heavy loads are to be carried on the grid, the springing of the body must be designed for that purpose, in which case it is probably too rigid for comfort when no additional load is carried.

We would further point out that serious accidents have occurred owing to the overloading of grids attached to sidecar bodies, the springing of which was never intended for that purpose. The additional weight at the back throws undue strain on the front points of attachment of the body, particularly during rapid acceleration, and should the front connections give way the body is apt to turn completely over in a backward direction, pivoting on its spring shackles, and the passenger meeting the ground head-first and in a most unenviable position.

It is, all things considered, unwise to attach grids to sidecar bodies that were never intended for that purpose, for though the danger of serious accident may be remote, it is very doubtful whether the springs will stand the strain, and the arrangement seldom proves satisfactory.

In the case of one or two luxurious outfits, grids attached to the body are provided, and endlessly useful they prove, but we have found very few sidecar manufacturers at all anxious to fall in with a request to equip their standard models in this way. In the case of medium weight outfits, some system of adjustable springing might be arrived at, the act of unfolding the grid bringing into action simultaneously some form of supplementary spring to take up the additional load, but even this suggests complications.

One would imagine a tiny Pacific island to be the last place in which to find motor cycles and keen motor cyclists. But in the island of Suva, of the Fijian group, there is quite a live little club. The photograph sent to us by Mr. H. Lanyon shows with their owners an Ariel, Rudge, American Excelsior, and three Harley-Davidsons.

❀ ❀ ❀

Independently-sprung Luggage Grids.

A GOOD many experiments have been tried with luggage grids having their own independent springing systems, which are attached to the rigid chassis; but here again we are up against difficulties. It is difficult to design a system of springing of this kind having a sufficient range of movement. Even if the range be sufficient, the rebound is generally so rapid that the luggage thus mounted receives a worse jolting and shaking than if it were on a rigid carrier. For a spring carrier of this kind to work well under a dead weight friction springing is necessary to damp out the rebound, all of which means additional expense and weight.

These facts point to the further desirability of springing the sidecar wheel, in which case a good grid, sufficient for all requirements, could be attached to the chassis in the obvious way.

Some sidecars are provided with a box or boot behind the upholstered backrest of the seat, and such provision is highly desirable for the Overseas vehicle. In fact, the Overseas rider is grateful for any additional carrying room the ingenuity of the manufacturer can provide.

A Selection of Letters from Readers scattered all over the World.

Current Prices in India.

"A BOMBAY RIDER," a Douglas enthusiast, writes: "You may be interested to know how things are developing in Bombay. The only new British machines to reach us so far have been W.D. Triumphs, six of which arrived last month, and were snapped up immediately, although the price was fairly stiff, being £120. I examined one carefully, and although I am not a lover of the 'single,' could not help admiring this beautiful specimen of its class—a sturdy Britisher all through. I consider (and so do many others here) that the one thing required to make the Triumph perfect is a decent system of lubrication, instead of a crude hand pump, as at present. A drip feed preferably, with a dome-shaped indicator on the tank (like the New Hudson and Norton) would be a great improvement. With a hand pump even experienced riders sometimes have a sneaky feeling that the lubrication is being neglected.

"American machines—Indians and Harley-Davidsons—are expected this month. The agents for the latter tell me that we shall not see the Harley-Davidson flat twin this year, as the production is not sufficient to meet the demand in America. Another machine we are all dying to see is the A.B.C. Personally, I am patiently waiting for my old pal the 2¾ h.p. Douglas.

"Wishing you the best of luck."

The Motor Cycle and Japanese Competition.

LT. E. C. HILL, writing from Lahore, India, prophesies that the Japanese will soon be competitors in the motor cycle field. "With further reference to two or three letters published in *The Motor Cycle*, dated January 23rd, referring to the inflated prices of motor cycles, I wonder if any of your readers at home, and manufacturers, too, have considered the lot of the motor cyclists abroad? The prices asked for 1919 machines are almost impossible, and are only possible to the favoured who have made good on the war. Before the war I was resident in Malaya, and then paid £70 for a solo 3½ h.p. James new (fixed engine and gear). To-day, in India, this is the average price *for a second-hand machine*, and added to this hardship it is very difficult to obtain spares, and when obtainable the prices are such as to make one disgusted with motor cycling. There are thousands out here who would indulge in motor cycling, but that it is beyond a joke—the second-hand machine is too expensive to buy, and the spares required for such are indeed numerous, and, when obtainable, make you think twice before buying them. If this, then, is the case with second-hand machines, what is the lot of the new? Nobody wants them; they are beyond the reach of thousands of likely riders. In the principal cities one can count the number of new machines to be seen in six months on one hand. 'The Buyers' Guide,' published in the issue referred to above, is disheartening. From the figures published, the new machine is going to cost nothing less than £100 for a 3½ h.p. solo. We know that labour, fuel, and material have all gone up, but do not forget that those abroad have *got* to pay freight, insurance, and increased rates due to shortage of tonnage, etc., in addition to the make-hay-while-the-sun-shines-at-home prices.

"In conclusion, I may add that American machines are pretty plentiful out here, and possibly we shall not be very long before the enterprising Japanese step into the breach, as they appear to have done in most lines. Motor cycle manufacturers at home are cutting their own throats by neglecting Overseas trade in this manner. The firm that first establishes itself out here with a good machine at a fair price would beat all comers. There are new fields of enterprise, too, of which India may be considered the hub, and what could be better than an established motor cycle business to compete with it?"

The M.C.C. of South Australia.

MR. ALFRED MOYLE, writing from West Australia, says: "The Motor Cycle Club of South Australia intends next season to carry out a programme of events that will keep the possibilities of the motor cycle well before the public, as, in spite of the splendid work they have performed at the Front, motors are still spoken of as a nuisance by a certain section.

"About three years ago we discovered a fine racing track, about three miles long, on a beach known as Sellick's, where, with a suitable tide, after a competition of forty events, with inevitable trial runs, the surface is still perfect. This hardness of surface is accounted for by the sand (about 6in. deep) having for its bed a layer of pebbles, which has an effect similar to concrete. At low tide there is width enough to race three cars abreast.

"Our best times on this track up to date are (electrically timed): Half-mile solo, E. Ferguson (8 h.p. Indian), 20⅘s.; passenger, E. Ferguson (8 h.p. Indian sc.), 22⅘s.; one mile, solo, E. Ferguson (8 h.p. Indian), 38⅘s.; passenger, E. Ferguson (8 h.p. Indian sc.), 45⅘s. The standard touring model passenger one mile is held by A. Smith (Excelsior sc.), 49⅘s. All flying starts.

"This beach is thirty-five miles South of Adelaide, so much of the day is taken up by travelling to and from the scene of action. For our long distance events of 100 and 200 miles, which we hold once a year, we have to travel 138 miles by road, or fifty miles by steamer and twenty miles by road. We are obliged to travel these long distances because the councils who control the roads near Adelaide will not grant us permission for their use, and this permission must be received before we are allowed to break the speed limits which are arranged in all districts.

"We recently held our annual 100 and 200 miles race at Winlaton, Yorke's Peninsula. The 200 miles was run by C. W. A. Korner (Powerplus Indian) in 3h. 50m. 9s., E. C. Wagener (Harley-Davidson) being second in 4h. 12m. 9s. The 100 miles was won by A. Smith (Excelsior sc.) in 2h. 16m. 12⅘s., C. C. Souter (Harley-Davidson sc.) being second in 2h. 24m. 28⅘s.

"It will be noted that all these wins are on American machines, the reason being that American machines are at present all we have to choose from, the British machines still in use being too old for competition work; but we are anxiously looking forward to the time when our Triumphs, J.A.P.'s, Precisions, or other British brands shall appear and show what can be done after four years' experience of war work.

"As far as Colonial models are required here in South Australia, I am certain that if a special heavy model, with high clearance, were put on the market it would be turned down by our riders, because the locally built machines are practically on the same lines as the Triumph, with perhaps larger tyres (2½in.) and Chater-Lea or Druid forks; and if more clearance and the number of so-called improvements advocated for a Colonial model are required we should have had them in our locally built machines long ago."

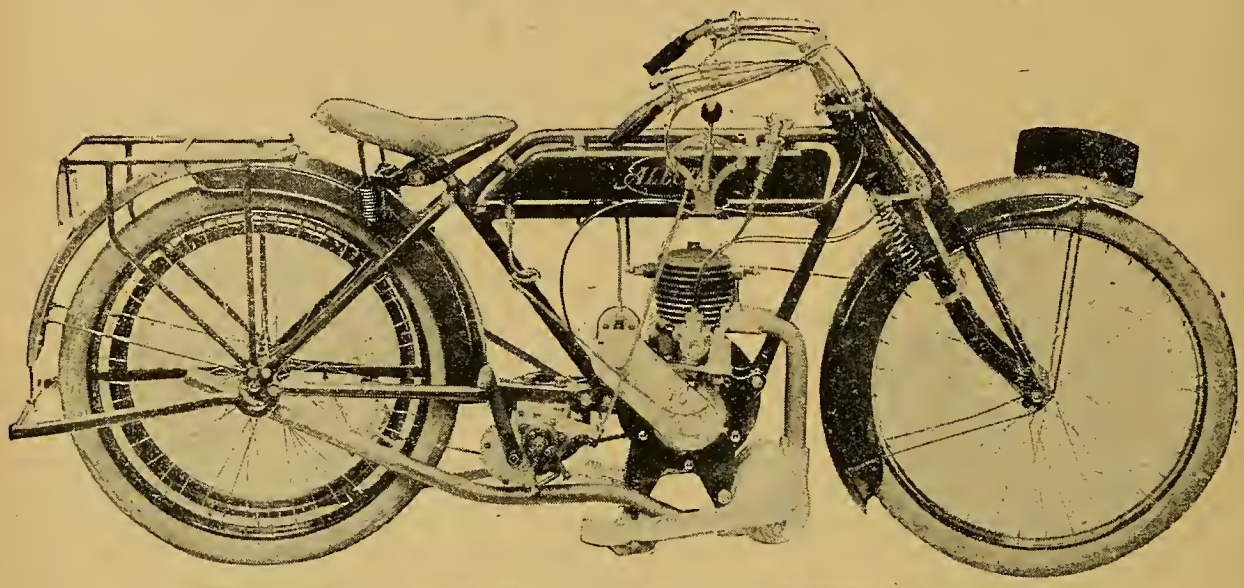
A Home-made Three-wheeler.

D. S. RAMSAY, writing from Middelburg, South Africa, says: "I have been a reader of *The Motor Cycle* for some years now, and look forward to its arrival like a child does to a new toy. Formerly, I had a single-cylinder Indian (single speed), which I ran solo until I got married. Then I made a sidecar, and, although the machine pulled the sidecar all right, I did not like the sidecar idea, so I put on my thinking cap, and a three-wheeler containing the Indian parts is the result.

"The car is composed of the motor cycle with the front wheel and forks, and the handle-bars taken off. A frame was made in the shape of a triangle, and clamped on the machine at the sidecar lugs. The front axle is sprung, no springs being fitted at the back as it is my intention to put a spring frame 7-9 Indian in place of the old machine. As no English ash was obtainable in this out of the way place, common deal was used for the frame and stayed up aeroplane fashion to stand the strain. Steering at present is direct, but I am only wanting a chance of getting a cable, then I shall fit up bobbin and cable steering. The 4 h.p. engine, geared 5¼ to 1, pulls wonderfully for its size, but I am sure the makers would not recognise the engine now—some experiments with the cams, timing, and one thing and another, have knocked a good few more revs. out of the old engine. I have been running the machine five weeks now over very rough roads. I have never bumped the crank case against anything yet, but when I tell you that my wife, myself, and a baby two months old ride in the car you will understand that the construction is quite sound. Being the first car with three wheels seen in Middelburg, it is a great attraction."

A MEDIUM WEIGHT TWO-STROKE.

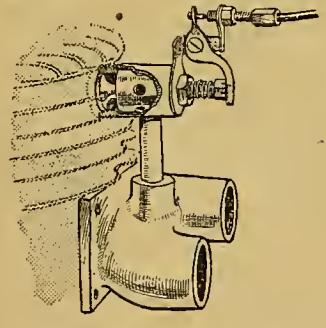
The Alecto—Another New Two-stroke in the 350 c.c. Class.



The latest two-stroke to be introduced, the Alecto, which has a 76 × 76 mm. engine nominally rated as 3½ h.p.

A NEWCOMER in the motor cycle world is the 3½ h.p. Alecto, quite an interesting mount, the engine of which is manufactured by the makers of the machine, Messrs. Cashmore Brothers, Hildreth Road, Balham, London, S.W.

The engine possesses several novel features, and is constructed on the three-port system. There is a spacious transfer port, in which there is a plug 1½in. in



The compression release, which passes the gas into the twin exhaust pipes.

diameter, and when this plug is removed it allows easy access to the ports for cleaning. The exhaust port has a twin outlet, each outlet being 1¼in. in diameter, and it exhausts into a silencer 5in. in diameter and 9in. long, three times the capacity of the cylinder, the exhaust finally passing into the air through a long tail pipe 1½in. in diameter. The release valve exhausts directly into the twin exhaust pipe union, and when the compression is released there is complete absence of sound. This does away with one of the most objectionable features of many two-stroke engines.

The cylinder itself is provided with deep fins, so that the cooling should be quite efficient, and it is composed of cast iron in accordance with A.I.D. specification. The crankshaft is made of 62 ton tensile steel, and the connecting rods are made of the same material, while the flywheel is a mild steel stamping. The piston is of an aluminium alloy, known as Magnalium, and possesses two rings, a compression ring and a scraper ring.

Ball Bearing Mainshaft.

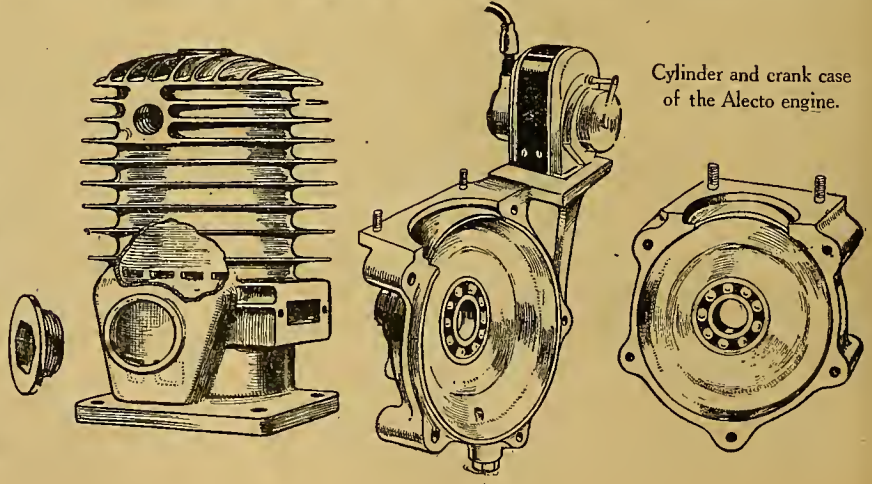
Turning to the crank case, the size of the ball bearings is extremely noticeable. These are of the double row Skefko pattern, and the crankshaft journals also run in white metal bearings in bronze housings, which enables the crank case compression to be retained. It is also interesting to note that the connecting rod big end bearing is of the split variety, and is white metal lined, not a very usual feature in motor cycle construction.

The metric system is employed throughout in the dimensions of the engine parts.

Another noteworthy feature of the Alecto is the substantial cradle, which is used for supporting not only the engine, but also the silencer and footboards. So far as the rest of the machine is concerned, the frame illustrated is not the final model, which will be provided with a straight top tube and an oil tank carried under the saddle. The machine is fitted with a Brooks saddle and a Juckes two-speed gear and kick starter; the final model will be equipped with Brampton forks.

It is interesting to find that at last the two-stroke engine is attracting designers who are willing to incorporate the results of the latest researches in construction, and to get away from the tendency to copy one or two successful and conventional designs.

The Alecto motor bicycle is one of great promise, and we look forward with much pleasure to some experience with it on the road.



Cylinder and crank case of the Alecto engine.

The Essex Motor Club Open Speed Trials.

A Well-attended Meeting. Arrangements Marred by Showers.

J. R. Pattinson, 4¼ B.S.A. sidecar, who won first prize in Event XVI.

THE best supported event since trials were restarted was the Essex Motor Club's speed test run off at Southend on Wednesday, last week, with the help of the Southend and District Automobile Club. Numerous well-known motorists took part in the organisation. The stewards were Major A. M. Low, R.A., Mr. S. G. Cummings, and Mr. R. J. Wilson. Mr. A. G. Reynolds, lately recovered from a dangerous illness, was, we are glad to say, able to act as one of the judges. Messrs. A. V. Ebblewhite and T. D. Dutton were the timekeepers, while Major Loughborough, R.G.A., the brother of the secretary of the A.C.U., occupied the post of timekeepers' auditor, and assisted by Mr. S. C. Westall and Sgt.-Maj. Summer, R.G.A., undertook the laying of the field telephone, which proved far more reliable than these instruments usually are during motor cycle events. The hon. sec. of the meeting was Mr. Harold Fuller.

Altogether there were 237 motor cycle and ninety car entries, and prizes to the value of £200 were offered. The Essex Motor Club put forward strenuous efforts to run the tests with clocklike precision. They started punctually to time at 2 p.m., and so sandwiched in the car with the motor cycle events that the competitors in the latter had plenty of time to return to the starting point to be ready to take part in the next event. But the weather entirely upset the programme. A strong westerly breeze blew down the course in favour of the competitors, but rain fell just after the start, lightly at first, and then in torrents. In a few moments the course was unsuitable for solo motor cycles, so the car classes were run off, and thereafter some confusion and a good deal of delay followed. Later the weather cleared up, but to the spectator the event developed into an intermittent and meaningless procession of motor vehicles, as no classes, were announced and few times were published.

Many Well-known Competitors.

The competitors' numbers were ineffective, and, being mostly illegible, were a source of much trouble to the timekeepers' helpers at the finish. Barker (Henderson) had a spill early in the afternoon, but was able to continue to compete in other events.

The motor cycle events were run in classes, and the results were based on the times made over the kilometre course, but the car events, which included several vehicles in which this journal is interested, were run on handicap.

Among the competitors we were pleased to see Major Jack Woodhouse, D.S.O., who did such magnificent work in the war, Sgt. Milner, the inseparables W. A. Jacobs and J. P. Le Grand, and that fine old sportsman F. W. Applebee. E. J. Bass, lately returned from Germany, was clerk of the course.

The results of the motor cycle events were as follows:

EVENT I.

STANDARD TOURING MACHINES, 250 c.c.—First prize, gold medal; second prize, silver medal.

	Time, sec.	Speed, m.p.h.
1. F. Thorpe, 2¾ Douglas (standing start)	46⅘	= 47.82
2. A. Milner, 2¾ Diamond (standing start)	47⅖	= 47.21
3. G. McIntosh, 2¼ Singer (standing start)	49⅜	= 45.11

EVENT II.

TOURING CARS, 1,100 c.c.—First prize, bronze medal.

1. W. D. Hawkes, 10 G.N. standard (scr.)	56	= 39.96
2. R. O. Lowe, 8 A.V. Monocar (4s. start)	56⅘	= 39.41

EVENT IV.

STANDARD TOURING MACHINES, 1,000 c.c.—First prize, gold medal; second, silver; third, bronze.

1. B. Houlding, 7 Harley-Davidson	36⅖	= 61.48
2. H. Petty, 3½ Norton	37⅜	= 59.51
3. S. Marks, 7 Harley-Davidson	37⅘	= 59.20

EVENT V.

STANDARD TOURING MACHINES, 250 c.c.—First prize, silver medal.

1. J. V. Prestwich, 2¾ Diamond-Jap	57	= 39.25
2. W. A. Jacobs, 1½ Singer	65⅘	= 33.79

A. Milner (2¾ shaft-chain-drive Diamond), J. V. Prestwich (2¾ Diamond-Jap), and A. E. Wills (2¾ Douglas) about to start in Event XXI., the 350 c.c. solo race.

EVENT VI.

CYCLE CAR HANDICAP.—First prize, silver medal.

	Time, sec.	Speed, m.p.h.
1. E. B. Ware, 8 Morgan (2½s. start)	53⅘	= 41.59
2. W. D. Hawkes, 8 Morgan (2½s. start)	55	= 40.68

EVENT VII.

STANDARD TOURING MACHINES, 500 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. H. Le Vack, 3½ Edmund-M.A.G.	47	= 47.61
2. A. Milner, 2¾ Diamond	47⅘	= 47.21
3. F. G. Plnck, 3½ Primus	48	= 46.62

EVENT VIII.

ANY SIDECAR MACHINE, 1,000 C.C.—First prize, silver medal; second prize, bronze medal.

1. B. Houlding, 7 Harley-Davidson	41½	= 54.31

EVENT IX.

TOURING CARS, 1,500 C.C. (MEMBERS).—First prize, silver medal; second prize, bronze medal.

1. R. O. Lowe, 8 A.V. Monocar (6s. start)	48⅘	= 45.85
2. W. D. Hawkes, 10 G.N. st'nd'rd (2s. st.)	54⅘	= 40.99

EVENT X.

STANDARD TOURING MACHINES, 750 C.C.—First prize, gold medal; second prize, silver medal.

1. L. A. Cushman, 6 Zenith	50½	= 44.58
2. F. Thorpe, 4 Douglas	58⅘	= 38.06

EVENT XI.

ANY SOLO MACHINE, 350 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. E. Kickham, 2¾ Douglas	37½	= 60.16
2. G. McIntosh, 2½ Singer	42⅘	= 52.77
3. A. Milner, 2¾ Diamond / R. C. Watkins, 2¾ Douglas	43⅘	= 51.80

EVENT XII.

CARS OF ANY DESCRIPTION, 1,000 C.C.—First prize, gold medal (presented by Mr. S. G. Cummings); second prize, gold medal; third prize, silver medal.

1. F. M. Avey, 5 A.V. Monocar (11s. start)	54⅘	= 40.99
2. W. L. Harris, 8 Marlborough (9½s. start)	54⅘	= 41.13
3. Capt Nash, 10 G.N. (scratch)	45	= 49.73

EVENT XIV.

STANDARD TOURING MACHINES, 1,000 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. Capt. G. Watkins, 8 Henderson	42⅘	= 52.77
2. L. A. Cushman, 6 Zenith	48⅘	= 46.05

EVENT XV.

CYCLE CAR HANDICAP (OPEN).—First prize, silver medal; second prize, bronze medal.

1. W. D. Hawkes, 8 Morgan (2½s. start)	53½	= 42.07
2. E. B. Ware, 8 Morgan (2½s. start)	54½	= 41.29
3. E. Longden, 8 Morgan (2½s. start)	56⅘	= 39.85

EVENT XVI.

TOURING SIDECAR MACHINES, 750 C.C.—First prize, bronze medal.

1. J. R. Pattinson, 4½ B.S.A.	64⅘	= 34.86

EVENT XVII.

ANY SOLO MACHINE, 500 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. J. W. Draper, 3½ Triumph	36⅘	= 61.13
2. A. H. Beach, 3½ Norton	37½	= 60.16
3. E. Kickham, 2¾ Douglas / Lt. G. A. Vandervell, 3½ Norton	38	= 58.88

EVENT XIX.

TOURING SIDECAR MACHINES, 1,000 C.C.—First prize, silver medal; second prize, bronze medal.

	Time, sec.	Speed, m.p.h.
1. W. J. Barker, 8 Henderson	53	= 42.22
2. H. Dobson, 8 Zenith	56	= 39.96
3. H. Stewart, 6 Enfield	56⅘	= 38.82

EVENT XX.

ANY SOLO MACHINE, UNLIMITED.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. Capt. O. Baldwin, 8 Matchless	32	= 69.92
2. H. R. Harveyson, 7 Indian / E. Remington, 8 N.U.T.	32⅘	= 69.07

EVENT XXI.

ANY SOLO MACHINE, 350 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. F. Kickham, 2¾ Douglas	43⅘	= 51.33
2. A. Milner, 2¾ Diamond	47½	= 47.42
3. R. C. Watkins, 2¾ Douglas	47⅘	= 47.21

EVENT XXII.

MOTOR SCOOTERS.—Special award, value £2 10s.; second prize, bronze medal.

1. H. H. Burrows, 1½ A.B.C. Skootamota	121⅘	= 18.5
2. C. Keddie, 1½ A.B.C. Skootamota	138	= 16.21

EVENT XXIV.

ANY SOLO MACHINE, 500 C.C.—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. E. Kickham, 2¾ Douglas	43	= 52.04
2. A. H. Beach, 3½ Norton	44½	= 50.51
3. J. W. Draper, 3½ Triumph	44⅘	= 50.10

EVENT XXV.

STANDARD TOURING MACHINES, 250 C.C.—First prize, silver medal.

1. W. A. Jacobs, 1½ Singer	45	= 49.73
2. J. V. Prestwich, 2¾ Diamond-Jap	49½	= 44.93

EVENT XXVI.

ANY SOLO MACHINE, 750 C.C.—First prize, silver medal second prize, bronze medal.

1. J. W. Draper, 3½ Triumph	43	= 52.04

EVENT XXVIII.

ANY SIDECAR MACHINE, 750 C.C.—First prize, silver medal; second prize, bronze medal.

1. Capt. Charlesworth, 5 Zenith	44	= 50.86

EVENT XXIX.

ANY SOLO MACHINE, 1,000 C.C. (Standing Start).—First prize, gold medal; second prize, silver medal; third prize, bronze medal.

1. Capt. O. Baldwin, 8 Matchless	40½	= 54.84
2. A. J. Winstanley, 8 Zenith	41	= 54.58
3. H. R. Harveyson, 7 Indian	41½	= 54.31

EVENT XXX.

CARS OF ANY DESCRIPTION, 1,500 C.C.—Special prize, value 5 guineas, presented by the Southend and District A.C.; second prize, gold medal; third prize, silver medal.

1. H. G. Severn, 5 A.V. Monocar (11s. st.)	41⅘	= 53.72
2. F. M. Avey, 5 A.V. Monocar (11s. start)	42	= 53.23

EVENT XXXI.

ANY SOLO MACHINE, 750 C.C.—First prize, silver medal; second prize, bronze medal.

1. Capt. Charlesworth, 5 Zenith	37½	= 60.47
2. Major J. Woodhouse, D.S.O., 3½ Norton	39	= 57.35
3. H. Petty, 3½ Norton	39⅘	= 56.50

EVENT XXXII.

ANY SOLO MACHINE, UNLIMITED.—First prize, silver cup presented by Mr. H. H. Burrows; second prize, gold medal; third prize, silver medal; fourth prize, bronze medal.

	Time, sec.	Speed, m.p.h.
1. Capt. O. Baldwin, 8 Matchless	42⅘	= 52.77
2. E. C. Baragwanath, 8 Zenith	42⅘	= 52.29
3. Capt. Watson, 8 Henderson	43⅘	= 51.33
4. Maj. J. Woodhouse, D.S.O., 3½ Norton	44⅘	= 50.18

EVENT XXXIV.

TOURING SIDECAR MACHINES, 1,000 C.C.—First prize, silver medal; second prize, bronze medal.

1. B. Houlding, 7 Harley-Davidson	39	= 57.35
2. F. R. Hardinge, 7 Indian	48⅘	= 46.24
3. H. Stewart, 6 Enfield	48½	= 45.85

EVENT XXXVII.

ANY SOLO MACHINE, 1,000 C.C.—Special prize, value 5 guineas, presented by Messrs. Godfreys, Ltd.; second prize, gold medal; third prize, silver medal; fourth prize, bronze medal.

1. E. Remington, 8 N.U.T.	31⅘	= 70.81
2. Capt. O. Baldwin, 8 Matchless	32	= 69.92
3. E. Baragwanath, 8 Zenith	34⅘	= 64.68
4. S. F. Garrett, 7 Indian	35	= 63.9

EVENT XXXVIII.

TOURING SIDECAR MACHINES, 750 C.C. (Flying Start).—First prize, silver medal; second prize, bronze medal.

1. Capt. Charlesworth, 5 Zenith	44½	= 50.51
2. J. R. Pattison, 4½ B.S.A.	52⅘	= 42.71

EVENT XXXIX.

ANY SIDECAR MACHINE, 500 C.C. (Standing Start).—First prize, silver medal.

1. F. W. Applebee, 4½ B.S.A.	78⅘	= 28.53

EVENT XLI.

STANDARD TOURING MACHINES, 750 C.C.—First prize gold medal; second prize, silver medal.

1. H. Petty, 3½ Norton / R. Charlesworth, 5 Zenith	38	= 58.88
3. J. Boxall, 5 Indian	43⅘	= 51.09

EVENT XLIII.

STANDARD TOURING MACHINES, 500 C.C.—First prize gold medal; second prize, silver medal; third prize bronze medal.

1. H. Petty, 3½ Norton	41⅘	= 54.05
2. A. Milner, 2¾ Diamond	42⅘	= 52.77
3. L. G. Brown, 3½ Rover	43	= 52.01

EVENTS XLIV AND XLVI.

ANY SIDECAR MACHINE, 1,000 C.C.—First prize, silver medal; second prize, bronze medal.

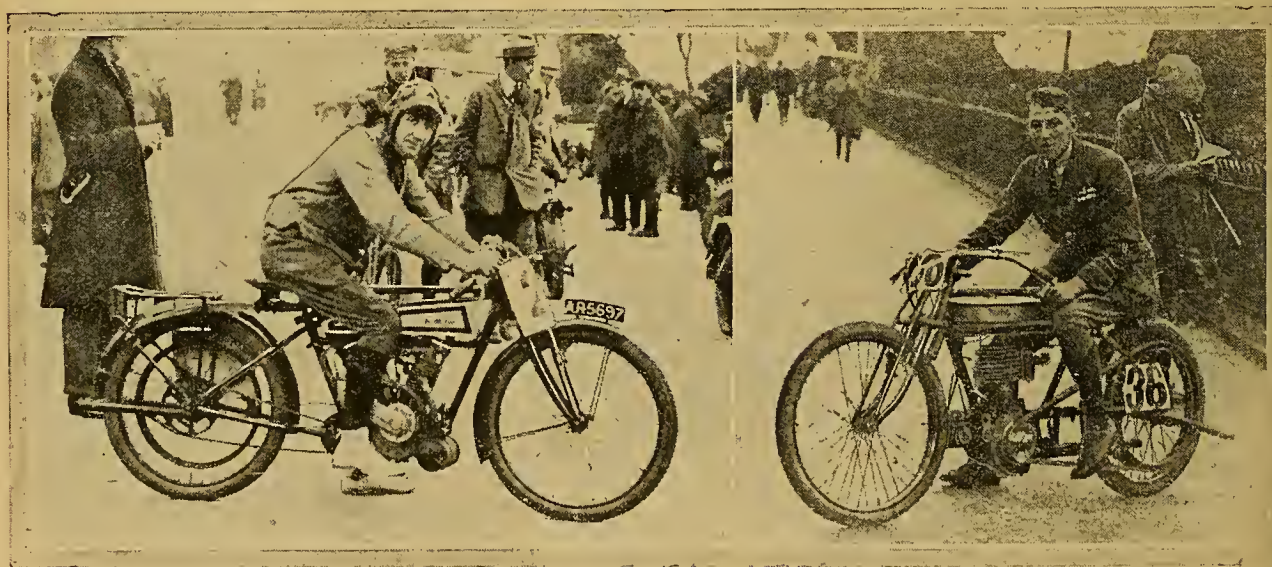
1. W. J. Barker, 8 Henderson	58	= 38.51

EVENT XLV.

STANDARD TOURING MACHINES, 350 C.C.—First prize gold medal; second prize, silver medal.

1. G. J. McIntosh, 2½ Singer	42½	= 53.03
2. J. V. Prestwich, 2¾ Diamond-Jap	44	= 50.86
3. Miss V. Wyatt, 2¾ Douglas	49⅘	= 45.11

For the Palmer Cup a silver rose bowl, value £30 was presented by the Palmer Tyre, Ltd., to the winner of the largest number of motor cycle events. There were three ties: Capt. Charlesworth, 5 Zenith, 3 wins; E. Kickham, 2¾ Douglas, 3 wins; and Capt. Baldwin 8 Matchless, 3 wins.



H. Le Vack (3½ Edmund-M.A.G.), first in Event VII., and Major J. Woodhouse, D.S.O., M.C. (3½ Norton), second in Event XXXI

Scottish Six Days Reliability Trials

Incidents Day by Day. Severity of Road and Weather Conditions account for Many Withdrawals.

In last week's issue illustrations were published of competitors and their machines, together with details of the route.

PERTH, MONDAY.

WE left Edinburgh this morning under ideal weather conditions, and the run to the first check at Stirling was without incident—save that, if facts were obtainable, it might stand out as the greatest blind in history. Dead straight, dead hard main roads the whole of the way—pot-holes? Yes, assuredly, but for the most part the road was tarred, and the occasional moth-eaten patches did not prevent a high average.

Lunch was at Crieff, not at Aberfeldy as the official programme would lead one to believe, and on the way one or two things happened. We came across Wills, busily shedding the last remaining relic of the chain case of his 6 Rover, and complaining of an elusive rattle. On arriving at the lunch control, we were told that Spence had fallen out, and was getting a new wheel axle turned up for his 4¼ B.S.A. It was said that he intended to continue, but we have not seen him since. We also heard that Hugh Gibson and Frank Smith, not to be deprived of at least seeing some of the fun of this classic event, had turned up on a new Clyno.

Amulree.

Somewhere between Crieff and Amulree, J. Shepherd (6 Campion) fell out for good, owing, it is said, to magneto transmission troubles. Not a murmur of tyre troubles yet.

We were on the famous hill in good time to obtain a seat. A very fair show of spectators were present, the weather being glorious.

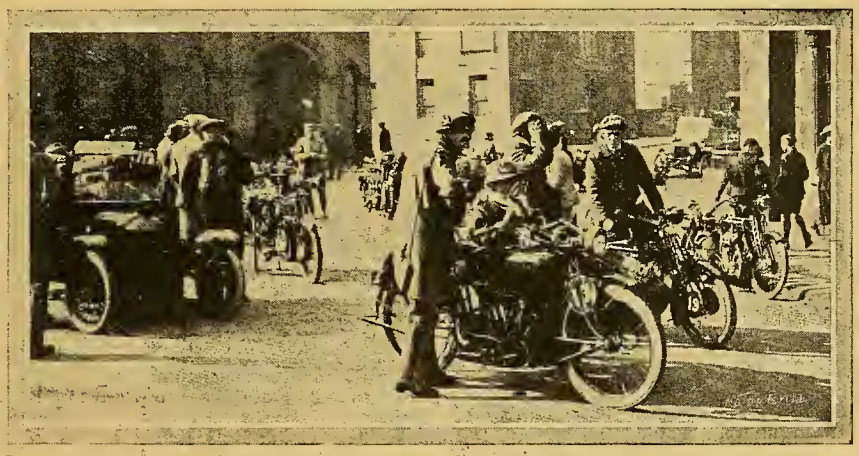
Wills, dead on time, came up behind us and made a clean ascent, though he found that the removal of the chain case had not removed his rattle which is worrying him.

The first bit of excitement was caused by Cunningham's Morgan. At the sound of his exhaust, the spectators stood clear. He stormed the first bend in fine style, but the second was too much for him. He slowly, but surely, came to a stop. Newman, who was directly following, rode skilfully round on his 3½ Sunbeam, and was cheered by the onlookers. H. Alexander (8 Enfield) failed, and. when finally Cunningham restarted and got away, he did so at the expense of his clutch, and was compelled to retire.

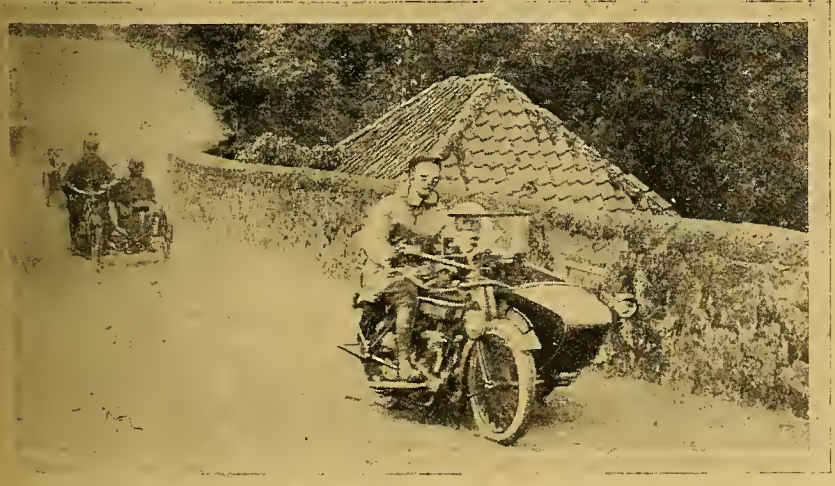
Beck (3½ Sunbeam) struck his footrests with a crash at the first corner, but managed to ricochet out of it. On the second corner he ran into the loose sand, charged the bank, and, of course, failed.

J. R. Alexander on his 7-9 Indian outfit made an excellent ascent, and Hutchison (4 Douglas sc.) negotiated both corners well, then, for some reason, konked out within five yards of the finish of the hill.

Douglas Alexander (8 Enfield sc.) came up much too fast, skidded round the first corner, and stopped on the second owing to his sidecar lifting. G. C. Stead (10 A.C.), the only light car entry, took the corners in fine style and climbed well. H. Hendry (5 Indian) stopped. A. L. Downie (2¾ A.J.S.) skidded badly on the first corner, but managed to recover. By means of repeated clutch slip he successfully negotiated the second, and proceeded up the hill in fits and starts, the engine alternatively racing and konking. His ascent, however, was clean.



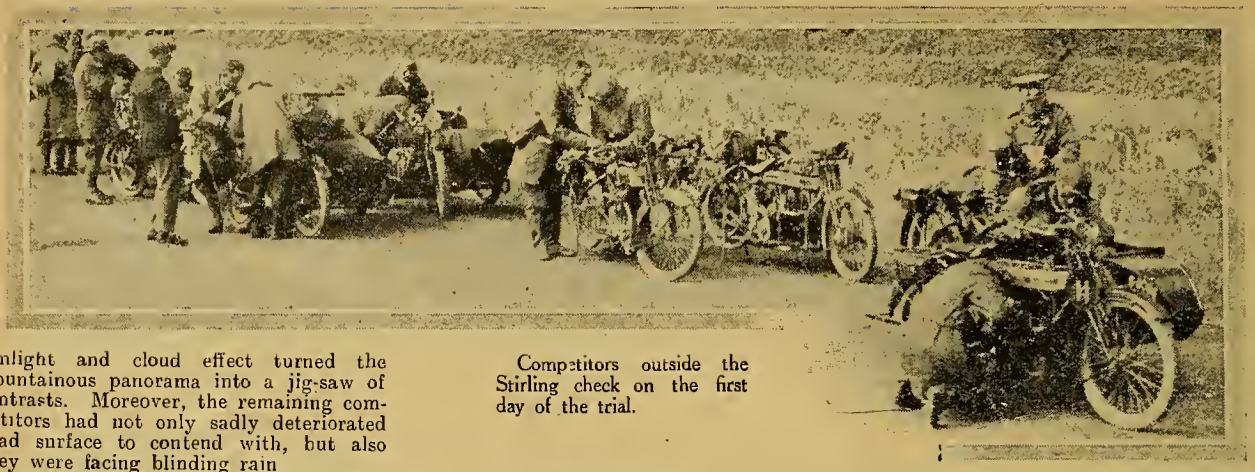
At the start from Croall's Garage, Edinburgh. J. Alexander (7-9 h.p. Indian sidecar), J. Shepherd (5-6 h.p. Campion), and a Morgan



D. S. Alexander (8 h.p. Enfield sidecar) and F. J. Hutchison (4 h.p. Douglas sidecar) passing through Falkirk.

Competitors Handicapped by Storm.

The glorious weather was now interrupted by one of those unexpected deluges reminiscent of every Scottish Six Days up to date. Fair spectators, clad in summer cottons, looked round hopelessly for shelter, and decided there was nothing for it but to go through with the business. The rain came down in torrents for perhaps fifteen minutes, but it was rather more refreshing than otherwise, and the



Competitors outside the Stirling check on the first day of the trial.

sunlight and cloud effect turned the mountainous panorama into a jig-saw of contrasts. Moreover, the remaining competitors had not only sadly deteriorated road surface to contend with, but also they were facing blinding rain

Duncan (4 h.p. Douglas) made a clever climb, and Olsson (4 h.p. Douglas) kicked and skidded his way round. The storm now became almost blinding, and Fairley (4¼ h.p. B.S.A.) took the second corner too fast, failed, and could not restart. Alan Hill, on his crimson Morgan, made a fine climb, as also did Macrae (Harley-Davidson sc.) and George Wray on his old Clyno. Baker, whose Scott is the smartest machine in the trial, came up with a regular T.T. roar, but, unfortunately, the rocks at the first corner jolted his throttle closed. He started with an immense reserve, and climbed easily, and similarly Fisher's Norton went up with power in hand.

Mrs. Bell made one of the cleanest and smartest climbs of the day, and was enthusiastically cheered, as she deserved to be. W. Young (4 h.p. Triumph) failed in no remarkable manner.

Grinton (7 h.p. Harley-Davidson sc.), Selby (4 h.p. Blackburne), and Miller (3½ h.p. P. and M.) took the hill by storm, and Tunbridge (6 h.p. A.J.S. sc.) and Downie (6 h.p. Ariel sc.), running neck and neck, forthwith made slow, cautious, and skilful ascents; the A.B.C. also climbed with ample reserve of power.

The condition of Amulree was about the same as usual, and, as usual, the short, steep, but unobserved rise beyond the hill, caused many forcible remarks.

On to Perth.

The weather now cleared, and the play of sunlight and cloud effect tempted one to dally on the hill-tops. The descent was a veritable nightmare, and we are tempted to think there will be many failures here on the return, owing to the appalling combination of loose sand and bedrocks that comprise the road.

We now kept to the rear, prepared to cheer up the cripples, but mile after mile was reeled off without a glimpse of a stranded roadfarer. Here and there we were shunted on to by-roads of appalling surface, but still no tyre troubles—those will come later. A good average was easily held to Perth, about eleven miles outside which city we found Miller repairing his rear tyre. A pointed stone had punched a hole clean through cover and tube.

MARKS LOST ON TIME.—Hendry, 21.

MARKS LOST ON AMULREE.—H. Alexander, 1; F. J. Hutchison, 1; J. Beck, 1; Cunningham, 1; D. S. Alexander, 1; H. Hendry, 1; D. Wright, 1; W. Young, -; Baker, 1.

SECOND DAY.

INVERNESS, TUESDAY.

Driving mist, stinging rain, diagonal draining gutters looming unexpectedly from the chaos of rocks and fog, unending miles of wet, shifting sand, of deep, slimy mud, of half wild mountain sheep minus decision of purpose or the strength of character to carry their intentions into effect; add to that house-side gradients and roads, which appear to have been designed by a tipsy corkscrew manufacturer, and one has a dim impression of to-day's riding. Those who have been associated with the trial from the first say they do not recall a day when weather and road conditions combined with such unity to annihilate the prospective gold medallist. Now and then we emerged below the clouds to catch glimpses of majestic salmon rivers or of deep, rich glens between the mountains—mere glimpses to help one to realise what the ride might have been. We have bumped and jolted and skidded for endless miles through rain we could not face, or peered anxiously through drifting highland mists in search of the next protruding rock or deeply washed water gulley calculated to break our frames, and for once the sidecarists were better able to stick the pace than the solo mounts. Immediately one attempted an acceleration one plunged into a sea of water or slime, rising suddenly from out of the mist, and immediately proceeded to give an excellent representation of a frog on a buttered plate.

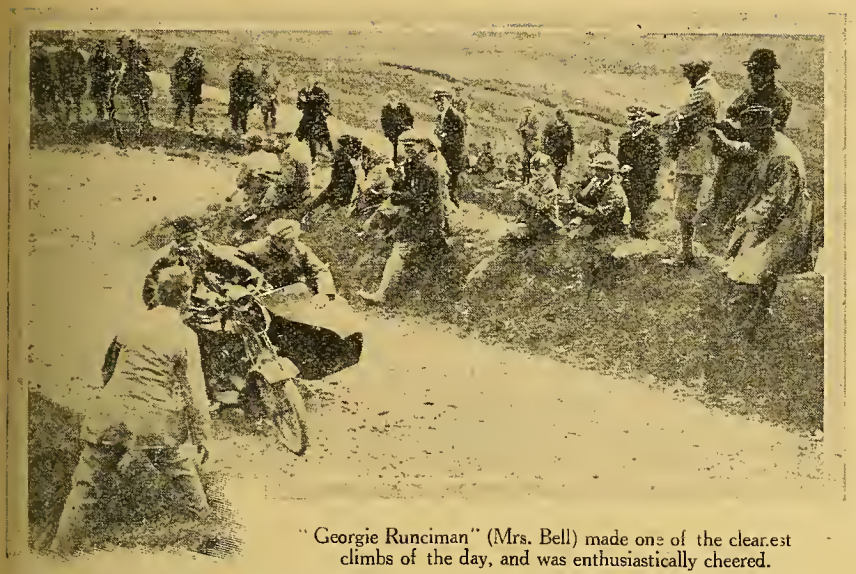
Anyway, here we are, with the bagpipes wailing without—waiting for the tail end of the dripping officials to come in with their clammy wet papers.

The Devil's Elbow.

Last night Alan Hill and Harry Macrae protested, and both protests were accepted. They had fallen, it seems, into the common error of imagining that "extra time" was allowed over and above schedule time, instead of included therein. Quite a number of green cards have gone out for to-night, but the tribunal results are not yet obtainable. The Devil's Elbow was in bad shape, and after that there followed, as one rider put it, "forty miles of concentrated hill!"

But to deal with the hill. Harry Macrae (7-9 h.p. Harley-Davidson sc.)

Douglas Alexander (8 h.p. Enfield sidecar) ascended Amulree at so high a speed that he collided with the bank on the second bend, nearly baulking Westwood (4 h.p. Triumph).



"Georgie Runciman" (Mrs. Bell) made one of the cleanest climbs of the day, and was enthusiastically cheered.

climbed well, and changed into middle directly after the second bend. Capt. Hay-Will (6 h.p. A.J.S. sc.) was badly baulked, and forced into the heather on the extreme left of the second bend. He kept up a good speed in spite of jolts, regained his grip, and recovered well, making an excellent performance. W. Young (4 h.p. Triumph) fell at the first corner, and the succeeding ten miles were too much for him. He checked in at Inverness very late. Downie (6 h.p. A.J.S. sc.) changed too late, and all but got into difficulties. Hill took the climb on his Morgan fast, with superb judgment. The Scott, the Norton, and the A.B.C. all made light work of the corners, and changed up immediately after the second bend. Wills (6 h.p. Rover), Milne (4¼ h.p. B.S.A.), Jameson (2½ h.p. Diamond), and Olsson (4 h.p. Douglas) all made excellent climbs, but, undoubtedly, the thrill of the morning was put up by Fairley (4¼ h.p. B.S.A.), who was behind time, and stormed the first corner at tremendous speed. Thereafter he skidded broadside about ten yards, turned a complete circle, and fell.

Competitors not mentioned all got up successfully.

Cockbridge Ladder.

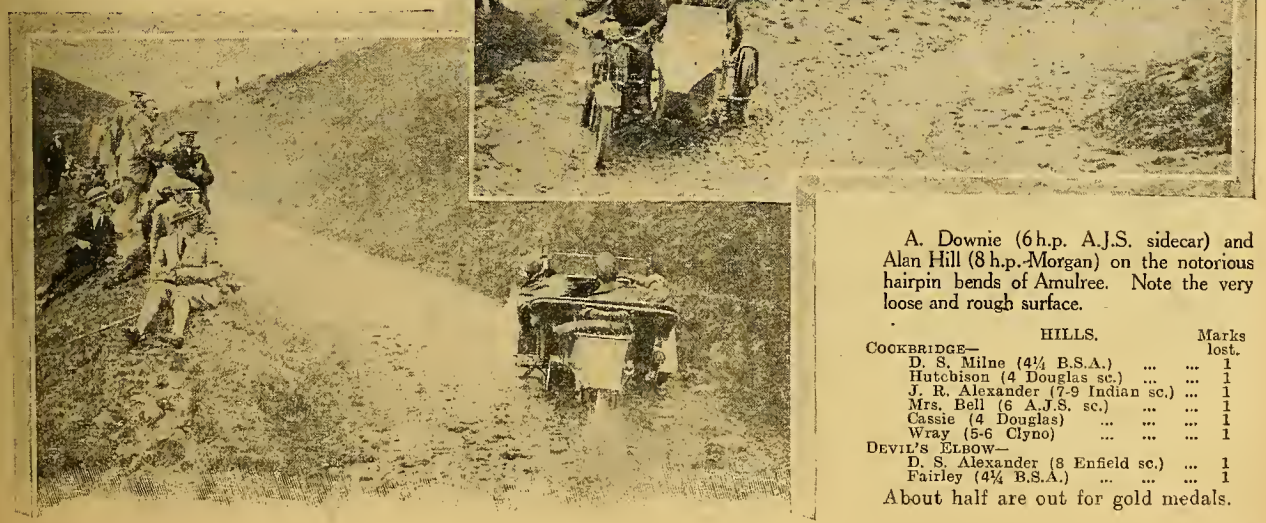
Lunch was at Braemar, and the second observed hill of the day was Cockbridge Ladder. The surface consists of wet yellow mud on solid bedrock. The first corner is easy, the second is a right angle on a gradient of about 1 in 3 with the road sloping the wrong way, then after about half a mile of stiff collar work there comes a second right angle, succeeded by miles of middle gear jolting, skidding, and grinding, so that skill alone did not suffice to assure clean ascents.

It was raining heavily when the first little batch of solo riders came along, but all got up well. Mrs. Bell (6 h.p. A.J.S. sc.) was the first sidecarist to arrive, and failed from wheel spin, baulking Moir (3½ h.p. Sunbeam), who rode round cleverly and made a very clean ascent. The driving mist now became a deluge. Miller (3½ h.p. P. and M.) rode up well, and Downie (5-6 h.p. Ariel) made a good climb in spite of wheel spin. George Wray (5-6 h.p. Clyno sc.) was apparently overgeared. He tackled the steeper side to get out of the slime, konked, and ran backwards, all but ejecting his passenger.

Milne (4¼ h.p. B.S.A.) failed from belt slip due to the wet, which was hard luck, as he was riding well. Carfrae (6 h.p. Bradbury sc.) muddled his gear at the bottom, but came up well. Macrae (7-9 h.p. Harley-Davidson sc.) made a good climb, and A. H. Alexander (4 h.p. Douglas sc.) kept going in spite of wheel spin.

The surface was now awful, the churning wheels cutting deeply into the mud, so that the gradient consisted of scores of wheel ruts, each one filled with a rivulet of trickling water. J. R. Alexander (7-9 h.p. Indian sc.) failed from wheel spin, but is, we understand, protesting, while D. S. Alexander (8 h.p. Enfield sc.) made a good climb. A. H. Alexander was baulked by Hutchison (4 h.p. Douglas sc.), but rode well, while Hutchison asserts that his failure was caused by an effort to avoid baulking Alexander.

TIME.	Marks lost.
J. Baker (3¾ Scott)	3
Hutchison (4 Douglas sc.)	6
Tunbridge (5-6 A.J.S. sc.)	7
Carfrae (6 Bradbury sc.)	9
Wray (5-6 Clyno)	15
Jameson (2½ Diamond)	22
A. Downie (5-6 Ariel)	25
H. Alexander (8 Enfield sc.)	29
Claud Duncan (4 Douglas)	83
Hendry (5 Indian) retired.	



A. Downie (6 h.p. A.J.S. sidecar) and Alan Hill (8 h.p. Morgan) on the notorious hairpin bends of Amulree. Note the very loose and rough surface.

About half are out for gold medals.

Scottish Six Days Reliability Trials.—

THIRD DAY.

INVERNESS, WEDNESDAY.

To-day has reduced the number of potential gold medallists to the merest smattering. The weather has been fine for the most part in the valleys, but practically all day we have been riding in the clouds through banks of driving mist over roads treacherous with wet clay, boulders, and shingle. The old hands among the competitors are unanimous in the opinion that this is the most difficult trial that has yet taken place.

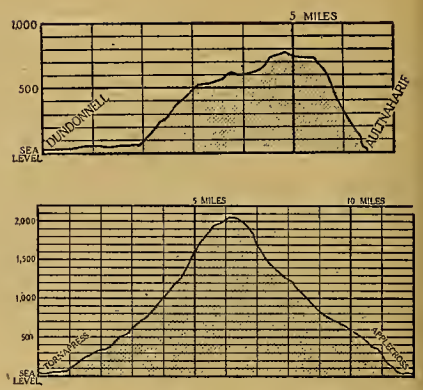
In 1914 solo competitors were allowed ten minutes' and passenger machines fifteen minutes' latitude of schedule time; this year all alike are allowed but four minutes. Added to this is the abnormal condition of road surfaces—factors which reduce the event to one prolonged T.T. Mrs. Bell and others are complaining of over-fatigue, and the number of starters to-morrow will depend largely upon the hearing of to-day's protest.

Nine miles out of Inverness a whole bunch missed an arrow and went nine or ten miles out of their way. Two did the thirty-five miles over freak hills and freak surfaces in the time allowed for the thirty-mile check, and a massed protest of the others is pending. The attempt to rectify the error over the appalling roads led to numerous mishaps, including Emerson (3 A.B.C.), who broke his frame and retired towards the end of the day. J. R. Alexander (7-9 Indian sc.) had a day of punctures, but, taking great risks, lost no marks on time over two-thirds of the journey when the tread came clean off his rear tyre, and he has now joined the ever-growing band of "tail-enders," for whom a bronze is the only possible award. Hutchison (4 Douglas sc.), after a clever climb of Aultnaharie, broke his sidecar chassis and retired. George Wray (5-6 Clyno sc.) broke a coupling on the outward journey when travelling at speed, and experienced a bad smash mounting an eight-foot bank and colliding with a telegraph pole. Luckily, neither he nor his passenger suffered injuries. Macrae (7-9 Harley sc.) also broke a sidecar connection and retired. Twelve different competitors have had more or less serious falls during the day, and tyre troubles have been unending.

We descended Aultnaharie through driving mist, took lunch at the foot, where there was just room to stack the machines at the loch margin, and later ascended.

The Ascent of Aultnaharie.

Nearly everyone was out of petrol and a motor boat was despatched for a fresh supply. The hill is about one and a half miles long, the gradient varying from 1 in 2.8. The surface consists of jagged rocks, boulders, sand, and shingle. The first three solos came up successfully. Macrae (7-9 Indian sc.), the first sidecarist rider, failed, as also did the surviving Morgan, both unable to obtain wheel grip. Hill's gold medal, therefore, is gone, which is hard lines, as he has a good machine, and drives it magnificently. The A.C. also failed. A. H. Alexander (4 Douglas sc.) made a superb ascent, and D. S. Alexander (8 Enfield sc.) passed us nearing the summit at high speed. J. R. Alexander (7-9 Indian sc.) made a marvellous climb, but H. Alexander (8 Enfield sc.) failed on the first corner, overheated owing to wheel spin, and was compelled to shed his passenger. J. Beck (3½ Sunbeam) went over the edge, rolling with his machine for twenty or thirty feet. Downie took the corner well without his passenger performing acrobatic feats Emerson (3 A.B.C.) purred up comfortably, but broke his chain midway. Moir (3½ Sunbeam) crashed among the rocks, Miller (3½ P. and M.), Wills (6 Rover), and Selby (4 Blackburne) all climbed skilfully. There were sixteen failures on the hill.



Wednesday's and Thursday's test hills. Contours of Aultnaharie and Applecross Hills taken from the Contour Road Book of Scotland.

MARKS LOST AFTER TO-DAY'S APPEALS.

	Marks lost.
Jeffreys (6 A.J.S.)	1
Stead (10 A.C.)	1
Hill (8 Morgan)	1
Bell (5-6 James sc.)	1
Moir (3½ Sunbeam)	1
Beck (3½ Sunbeam)	2
Baker (3¾ Scott)	4
Mrs. Bell (6 A.J.S. sc.)	11
Downie (5-6 Ariel)	34
Tunbridge (6 A.J.S. sc.)	43
J. R. Alexander (7-9 Indian sc.)	78
H. Alexander (8 Enfield sc.)	86
Duncan (4 Douglas)	167
Milne (4¼ B.S.A.)	225

RETIRED.

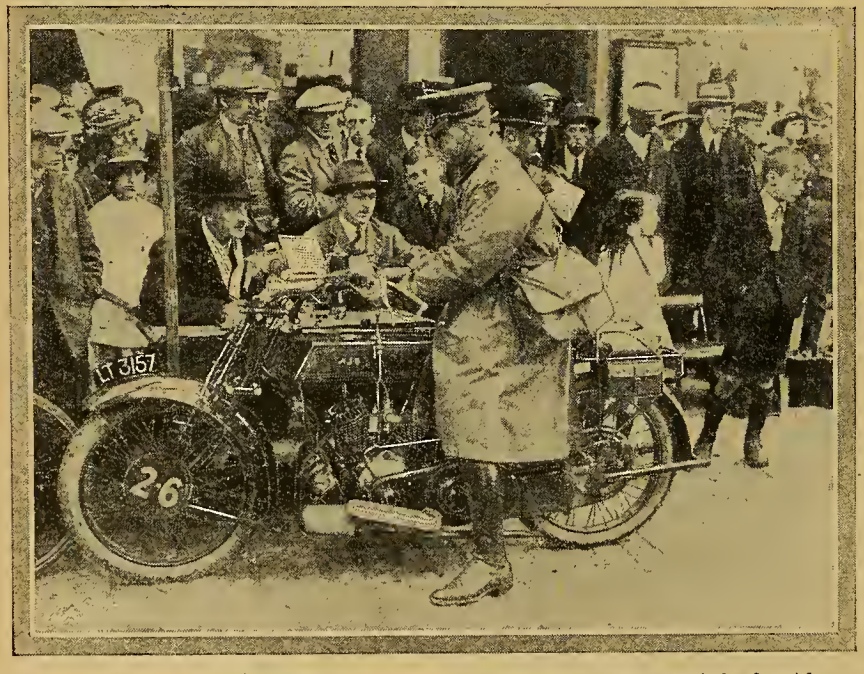
Spence (4¼ B.S.A.)
Macrae (7-9 Harley sc.)
Cunningham (8 Morgan).
Wright (3½ B.S.A.)
Hendry (5 Indian).
Hoyland (4 Norton).
Wray (5-6 Clyno).
Carfrae (5-6 Bradbury sc.)
Young (4 Triumph)
Emerson (3 A.B.C.)
Shepherd (5-6 Campion).
Hutchison (4 Douglas sc.)

Despite the gruelling, eighteen competitors still have clean sheets.

FOURTH DAY.

INVERNESS, THURSDAY.

The most remarkable news item of to-day is that it has not rained. We seem to have been ricochetting over mountain tracks, through drifting cloud banks, since trials began, but to-day brought a glorious relief in the way of almost uninterrupted sunshine, good roads, and an entire lack of exciting wayside incidents. J. R. Alexander's appalling luck as regards the tyres of his Indian held out. D. S. Alexander (8 Enfield sc.) broke a wheel spindle and retired. Moir (3½ Sunbeam) also has retired owing to tyre troubles. Applecross was, of course, the event of the ride. We ourselves rode out just ahead of the competitors, and made the long trying ascent with a following breeze in a stagnant atmosphere, the sun seeming to concentrate his rays on the hard-worked engine, yet the new 3½ Douglas, which we were now riding, took the interminable gradient with the greatest ease. We were, however,



His first trial. Captain Jeffreys (6 h.p. A.J.S.), who had heard so much of the Scottish Trials, although he had not competed in any event before, elected to make a tour of Scotland under the auspices of the Edinburgh M.C.

Scottish Six Days' Reliability Trials.—

glad to be mounted on a spring frame machine.

Halfway up we found McGregor making a restart, owing to the petrol having fallen to the back of his tank.

The Alexander Ford (he is driving with some of the lesser officials, and endless baggage in the tonneau) deserves a special award, as it has covered the entire route and climbed every hill so far, excepting Aultnaharie. Alluding to officials, we feel that special comment should be made concerning the kindly treatment that has been shown by the judges; no reasonable protest has been turned down, none have been refused a hearing. A sporting event conducted by sportsmen is a true description of the Scottish Six Days.

Ye gods! What a gruelling they are giving us, perched on a pinnacle commanding the three hairpins, the scene that lay below was in itself worthy of the ascent.

Overlooking the island-studded rock-dotted loch, with range after range of rugged indigo fading into the distance, the highest peaks were cloud wreathed, some indeed still carrying snow, and a fairy-like effect of light and shade played on the whole scene.

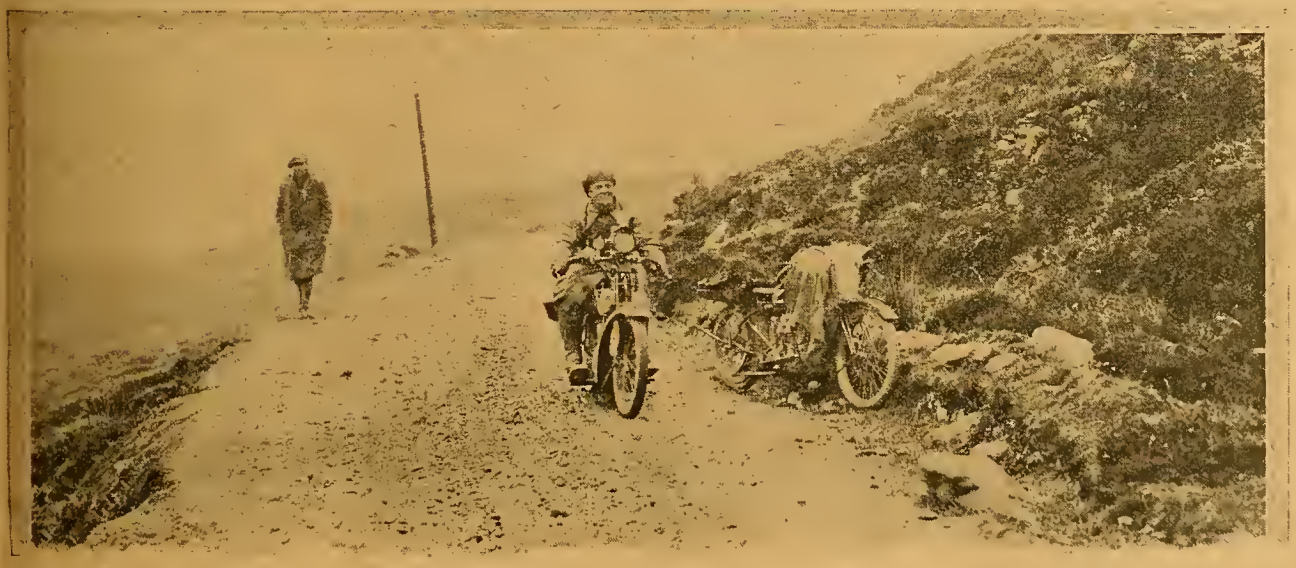
Newman (3½ Sunbeam) and Black (4 Triumph) went up in their usual good form. The last named, after 50,000 miles riding in France, is qualifying for the next T.T., and his reckless dash is paralleled only by his fine judgment. Stretton Miller (5½ P. and M.) is a superb reliability rider. This being only his third competition, he is a probable gold medallist, and this will make his third premier award. The Morgan climbed well: a cascade of shingle flying from the rear wheel, steam issuing with volcanic vigour from the radiator, it was certainly a fearsome machine, and the flying stones were dangerous to approach.

Baker (3¾ h.p. Scott), whose gear seems to grip with dog-clutch fierceness, took the first corners O.K., but over-ran, and crashed into the ditch at the second; he also had "got steam up."

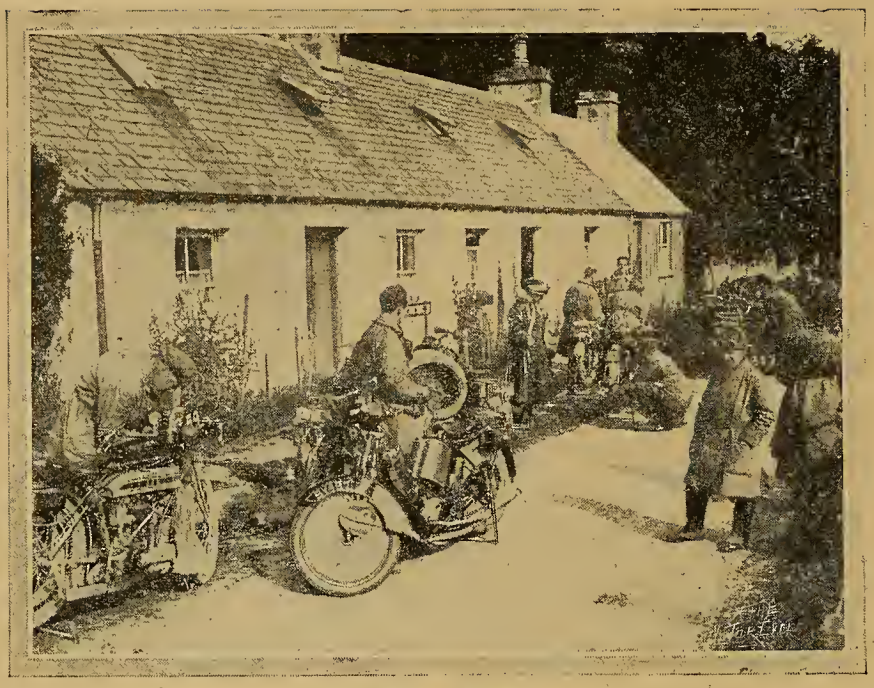
R. B. Clarke (4 h.p. Douglas) on Aultnaharie. Observe the slippery surface of the hill.

A. H. Alexander (4 Douglas sc.) hit the wall at the bottom corner with his sidecar wheel, otherwise he made a fine ascent. He, with Mrs. Alexander as a very plucky and skilful passenger, is piloting his little mount with an able hand. The pluck of the lady passengers and of the sole lady competitor is really inspiring. If Mrs. Bell (6 A.J.S. sc.) gets her bronze medal she will have triumphed over conditions which have tried out all but the topmost cream of the male competitors. Brash (7-9 Harley sc.) climbed well, and it may be added that this very able rider accomplished the impossible later in the day by changing the rear cover of his Harley-Davidson between checks in twelve minutes. The A.C. climbed with vim, and the Blackburne, as usual, was remarkable for its effortless ascent. Duncan (4 Douglas) was stopped on an easy part of the gradient by a boulder, the size of a man's two fists, jamming in his front forks.

It is rather remarkable that, with the exception of two failures, neither of which was due to lack of power, the competitors climbed the famous hill without effort, thanks mainly to the weather. We partook of an excellent outdoor lunch at the loch margin at Applecross, amidst scenery certainly hard to beat, returning by the same route. For romantic grandeur and absolute loneliness to-day's and yesterday's routes beat everything one reads of. Miles and veritable leagues with never a sign of human habitation! For hours one sees



E. W. Choldcroft (4 h.p. A.J.S.) at the summit of Aultnaharie, agreed to be the most severe climb



A halt outside Garve.

only a shepherd or a wandering tribe of half-wild gipsies. There is nothing but rock and heather, crags and clouds, and many of the competitors were quite distressed by the utter loneliness of the riding. The roads are made of splintered boulders, covered with earth and left for the rabbits to tread in.

All the schools are liberated to see the competitors, the children lined up, and encouraged to cheer us on our way. Bonny Scotland is the land of unparalleled scenery, unparalleled whisky, and the worst roads that the ingenuity and cussedness of a man sporting a sporran (in war-time) could devise.

The question of the evening is: "Who killed the blue Persian cat?"

Marks lost to-day:

Duncan (4 Douglas)	60
J. R. Alexander (7-9 Indian sc.) ...	46
E. J. Tunbridge (6 A.J.S. sc.) ...	8

Hutchison (4 Douglas sc.) got home yesterday by strapping up his broken chassis with dog collars. It is reported that it took him two hours to make friends with sufficient dogs to enable him to complete the repair.

The Diamond, which was running magnificently, experienced a broken valve and seven punctures yesterday; the previous day it ran out of petrol, ran some miles on paraffin, during which it was compelled to tackle a test-hill, with the result of a red-hot engine.

Thanks to the Vacuum man, who, of his own account yesterday, drove his car over the appalling route to Aultnaharie, Jameson, the Diamond rider, and several other competitors were helped out of oil shortage difficulties, which otherwise might have compelled abandonment of the trial.

FIFTH DAY.

INVERNESS, FRIDAY.

Leaving Inverness at eight o'clock—all that was left of us—we followed the Caledonian Canal and Loch Ness to Fort Augustus, the weather being perfect, and, therefore, the glorious mountain scenery at its best. Thence we climbed Glendoe, the test hill of the day, and away over good roads for the most part to Grantown, where an excellent lunch was provided at the Grant Arms Hotel. The quality of the meal and the reasonable charge made for it were both an appreciable relief after the tip top prices and rock bottom returns we have experienced at Inverness.

From Grantown onward the route was the same as traversed on Tuesday (Tomintoul, Cockbridge, Braemar, and Perth), save that, though the road remains the worst in the entire route, we were spared the discomfort and difficulties experienced on the northward journey.

In Glendoe the road winds along the course of the Glen, the verdant, pretty scenery being quite a contrast after the lonely grandeur of the mountain tops which have characterised the last few days. The observed portion of the hill is about four miles in length, undulating, but chiefly hard collar work, euding with two bad hairpins on a gradient of about 1 in 4,

J. R. Alexander (7-9 h.p. Indian sidecar) had a very useful passenger. On the slippery surface of Aultnaharie she provided the necessary extra weight to cause road adhesion of the back wheel.

In the glens between the rain storms. Vivian Olsson (4 h.p. Douglas) near Contin, and Mrs. Bell (6 h.p. A.J.S. sidecar) nearing Inverness, after four days' hard riding.

and a surface of deep dust intermingled with stones. In spite of a late start and belt troubles *en route* we managed to arrive well ahead of the competitors, and took our seat overlooking the hairpins, accompanied by Donald McKay (the assistant secretary) and others.

Westwood, on his Triumph, was the first to arrive, and made his usual steady climb. He is one of the few surviving veterans who have competed in every Scottish Six Days' Trial, and his riding and timekeeping are superb. Choldcroft (4 A.J.S.) wobbled somewhat, but kept going. He has made an excellent performance so far. Grinton (7-9 Harley-Davidson sc.) went up very fast, as also did Alan Hill, stones and steam shooting in all directions from the Morgan wheels and radiator. Mrs. Bell (6 A.J.S. sc.) experienced considerable front wheel banking, but got up all right. She deserves a gold, whatever she is awarded, and all the lady passengers deserve awards of some sort. Most of them, it is to be feared, are pretty near the end of their tether. Duncan Bell (5-6 James sc.) made a steady climb. We noticed a squashed petrol tin jammed under his sidecar body; perhaps it had arrived there by accident, but it must have relieved the springs of considerable strain on the rough portions of the road. The P. and M. and the Blackburne knocked slightly, the first hill on which they have shown such symptons, but, while the P. and M. got out easily, the Blackburne, to our complete surprise, all but failed. Baker's Scott was missing fire; he slipped his gear on the first corner, but, safely round, the gear gripped suddenly, and he konked out. He has since experienced considerable magneto trouble and retired.

Yorkshire's representatives. J. Baker (3¾ h.p. Scott) and W. Strettell Miller (3½ h.p. P. and M.) near Contin.

The A.C. light car failed from clutch slip. A. H. Alexander's Douglas was missing fire owing to contact-breaker troubles, and, unfortunately, konked out, thus depriving him of his probable gold. J. R. Alexander's (7-9 Indian sc.) was also missing fire, and again his high gear ratios proved his undoing.

As soon as Beck (3½ Sunbeam) appeared all the spectators got up the bank, but on this occasion he stuck to the road, though riding much faster than was necessary. Newman's Sunbeam probably made the star performance, though Jeffreys, riding the big A.J.S. solo, also did well. This Australian officer is to be congratulated on his success; he entered the trial with no knowledge of such things, and merely as a means of seeing Scotland. A. L. Downie has put up a good show on his little 2¾ A.J.S., and his brother, A. F. Downie (6 A.J.S. sc.) is one of the star performers of the trial. E. J. Tunbridge (6 A.J.S. sc.) konked out, and all those unnamed made clean ascents.

On the execrable roads succeeding Grantown, on which it was noticeable that many machines were misfiring, owing to the awful gruelling they have undergone, the first really regrettable accident occurred. Deans (3½ Ariel), who had a clean sheet hitherto, fell, and was run into by Grinton (7-9 Harley-Davidson). Deans's shoulder was slightly injured, while his Ariel was badly crumpled. The rear wheel of the Harley was buckled, but Grinton is continuing.

Duncan Bell (5-6 h.p. James sidecar) on Glendoe.

Alan Hill got his first puncture at Corgaff, and averaged 27 m.p.h. for nine miles over the most appalling portion of the whole route. The most exciting sprint of the whole trial was put up yesterday by D. Alexander (8 Enfield sc.), who did 39¼ miles over truly atrocious roads in one hour!

THE LAST DAY.

EDINBURGH, SATURDAY.

Midway in the week we would have prophesied that the first-class awards this year would be counted on the fingers of one hand; but, since then, glorious weather has favoured us, and, during such brief spells enjoyed in the Highlands, the most impossible hills became possible and the roughest tracks moderately rideable. As the trial nears its end, we have learnt how to make up the time over boulder-strewn and shifting surfaces. We have learnt to ignore our machines and our native instincts of self-preservation and to blind all out down steep gradients.

To-day's "pimple" was Kenmore on the north side of Amulree. When we descended this hill on Monday, it appeared a far more perilous gradient than Amulree itself, which we had just mounted, for the difficulties of Kenmore are enhanced by the jagged outcrops of rock which form slanting steps, as it were, at the worst hairpins. The gradient is, of course, terrific, but experience gained during the trial, combined with the fact that the road was at its best, were factors which prevented the hill from claiming its toll from the probable gold medal winners.

We had a glorious "blind" to the foot of the hill, and on the way we noticed that the rear wheel of one of the sidecars, which was badly buckled when the competitors checked in yesterday evening, had mysteriously straightened itself during the night. Selby (4 Blackburne) experienced an aggravating piece of bad luck. On the way out, he broke a chain link. His spares had gone astray, and

G. Grinton (7-9 h.p. Harley-Davidson) near Muir of Ord. Observe that the sidecar is fitted on the right side of the motor cycle in the American fashion.

he was riding the Blackburne without spares of any kind, so was compelled to retire. He had a clean sheet thereto, though we noticed yesterday that his engine had suddenly developed a mysterious overheating. Douglas Alexander (8 Enfield sc.) again had chain trouble, and once more put up some marvellous stunts.

On the hill, Black's Triumph exhibited its usual reserve of power, Hill (8 Morgan) came up very fast and took the second

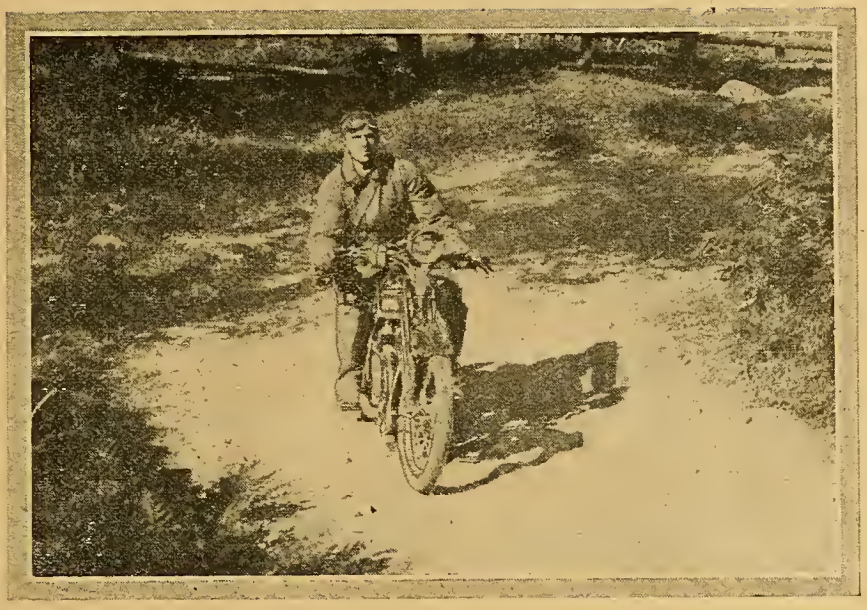
D. S. Milne (4½ h.p. B.S.A.) passing through the gateway on Glendoe.

Scottish Six Days' Reliability Trials.—

hairpin on two wheels in real Gordon-Bennett style, Tunbridge (6 A.J.S. sc.) failed on the first hairpin, and A. L. Downie (2¾ A.J.S.) is reported by the observer to have failed, thus losing his first mark. Downie, however, protests that his ascent was clean, and his protest

From rugged heights to peaceful valleys—the scenery is always changing in the course of the Scottish Trials.

was eventually upheld. Douglas Alexander (8 Enfield sc.) broke both engine chains within five yards of the end of the observed stretch, and all other competitors made clean ascents, thus bringing to an end the last of the difficulties of what has probably been the most strenuous British six-day trial on record.



J. A. Newman (3½ h.p. Sunbeam) on Kenmore.

Impressions.

Aultnaharie ridden cold was undoubtedly the worst hill of the trial, and, consequently, claimed the most victims, though Glendoe and Amulree also took their toll. Amulree is the first hill of the trial, and a good many competitors invariably fail through stage fright.

Thursday was the most strenuous day, the roads on both sides of Cockbridge being terrible at any time, and near upon impossible in driving mist and rain such as we encountered.

Wednesday also will live long in the memory of many of the riders, vile weather adding no little to the endless desolation of the route and the natural difficulties of the moorland tracks.

The special award has gone to trade rider A. F. Downie, who has put up an excellent performance on his A.J.S. sidecar. The solo riding gold medallists have run so close together in the uniform excellence of their performances that it is impossible to set down one as better than another. A. L. Downie (2¾ A.J.S.) probably overcame the greatest difficulties, as he had no power to play with, and climbed the various precipices only by delicate fingering of his clutch.

The lunch check at Grantown on the fifth day of the trial.

AULTNAHARIE—The most severe hill of the Scottish Trials.

J. W. Wills (5-6 h.p. Rover-Jap), who started first and rode well, winning a gold medal.

Of the new riders, J. W. Wills (5-6 Rover-Jap) rode well. He is given to "stunting," but is cautious where caution is needed. Experience will teach him to cut out the theatricals. Black's (4 Triumph) particular temperament is better adapted to the T.T. than a Scottish Six Days, but he is blessed with excellent judgment. Capt. W. Strettell Miller has a good head, and rode throughout in the most praiseworthy manner. G. H. Cassie (4 Douglas) takes his hairpins too fast, but, being a Highlander, he probably likes that sort of thing. Fairley (4¼ B.S.A.) is only nineteen years of age, and had not ridden a B.S.A. till the day before the trial, so his performance reflects credit both upon its makers and himself.

Of the silver medallists, Hill's (8 Morgan) judgment and the pluck of Mrs. Hill, his passenger, deserve special comment, while Mrs. Bell (A.J.S.) has, of course, put up a wonderful performance. A. H. Alexander (4 Douglas sc.) lost his gold medal only by his contact points working loose at the top of Glendoe, but he has achieved his purpose, in that he has proved the 4 h.p. Douglas as capable as a sidecar machine of climbing the worst hills in Scotland under the most strenuous conditions. Milne (4¼ B.S.A.) also is a steady rider. Among the third-class awards, Claude Duncan (4 Douglas) was "priceless." Eight punctures a day have been his average, and his gold and silver medals gone, leaving him with two hours to play with at every check; he instituted a system of tea parties and fishing expeditions, which were a source of endless merriment to the tale-end officials. The organisation and arrowing have been perfect, and the true sporting spirit of the event in every way upheld. McGregor, in his Ford, has covered the entire route and climbed every hill with the competitors—a most praiseworthy performance.

The pictures of the Scottish Trials are by "The Motor Cycle" photographer. Copies of prints published may be obtained from our Photographic Department, 20, Tudor Street, E.C. Half plate prints, 1/6 unmounted; whole plate, 2/6 unmounted, postage extra.

Incidentally.

The Motor Cycle representative rode one of the new 3½ h.p. spring frame Douglases. He covered the entire route, and observed every competitor on every hill—a feat which would probably have been impossible, owing to fatigue, on a rigid frame machine.

Every wheel of Downie's A.J.S. outfit is perfect, no side shake, and no broken spokes—the only time he has experienced such immunity in a Scottish Six Days'. He puts it down to larger wheels and tyres.

The lesson of the Scottish Six Days': "Go canny with unknown hairpins."

Macrae got his bit of fishing. Two fine trout on Friday and one on Saturday.

One competitor uncertain of the route eventually found a dead cat in the middle of the road and further on a dead rabbit. He was then sure he was right. Curiously enough McGregor's Ford was the only vehicle that preceded him.

There were sixteen failures on Aultnaharie, on Amulree only twelve.

A competitor, after a day of tyre troubles, went into a shop to buy a collar, and when questioned as to the size demanded 26 × 2½.

Emerson was a late starter, and midway on a mountain road ran out of petrol. A sporting car driver, thinking it was a race, rushed up to him, and insisted on instantly filling his tank, refusing payment, and urging him on in pursuit of the others.

Baker's Scott simply bristled with gadgets, which are the subjects of patents.

Claude Duncan (4 h.p. Douglas) ascending Kenmore.

A. Downie (6 A.J.S. sc.)

THIRD-CLASS AWARDS.

Claude Duncan (4 Douglas)
D. S. Alexander (8 Enfield sc.)
E. J. Tunbridge (6 A.J.S. sc.)

Summary.

To summarise the results, the solo machines are in the majority where gold medals are concerned on account of their larger entry, but the proportion of awards is very little higher than in the sidecar class.

This year's starters included twenty-nine solos, eighteen sidecars, two Morgans, and one light car. Of the solo machines nine secured gold medals, one special award, four silver medals, one bronze medal, and fourteen retired.

The sidecars secured two gold medals, one special award, four silver and two bronze medals, and eight retired. One Morgan obtained a silver medal, as did the only light car in the trial.

Retirements in the solo class represented nearly 50% of the starters, while in the sidecar class the proportion was a little over 55%.

Only those who have driven a sidecar through a Scottish Trial can appreciate the difficulties to be overcome, and the latter results, therefore, compare very favourably.

J. A. Newman (3½ h.p. Sunbeam) near Glendoe. He obtained a first-class award.

The withdrawal of the trade entries appeared to be a somewhat risky experiment, as most of the manufacturers were represented in the trials by sporting amateurs, and it must be a source of great satisfaction to most makers that these entrants have succeeded in riding to victory in a trial which is the most severe of any Six Days event to be organised. Road and climatic conditions added to the severity of the gradients made the winning of an award an achievement of which to be proud, and we congratulate the competitors, especially those who are newcomers to the competition field, upon their performances.

There can be no doubt that if the makers would now interview the competitors who rode their machines—especially those who were compelled to retire—some very valuable lessons could be learned.

There were no single-cylinder sidecar machines in this year's trial. In 1914 there were several, but Applecross proved their Waterloo. Hugh Gibson still retains the honour of being the only single-cylinder exponent to take a single-cylinder sidecar machine over Applecross in a Scottish Trial. This was in 1913, when he drove a 4 h.p. Bradbury.

Overheard at the Trials.

"What was yhond went up like yhond?"

"A Ford."

"It wa'na Ford. It were a wee Indian."

English Competitor: "What is the going like between B and A? Is it as bad as reported?"

Old Scot Competitor: "It's no easy mon, but—well, it's a *road*."

"Spring frames for next year's Six Days."

CLUB NEWS.

A Motor Cycle Club for Cardiff.

Motor cyclists residing in and near Cardiff who are interested in the formation of a motor cycling club for that district, are requested to communicate with Mr. R. B. Williams, Gowerton, Sully, near Cardiff.

Reading and District M.C. and L.C.C.

Reading and district motor cyclists and lightcarists are reorganising the local club, and the hon. secretary *(pro tem.)*, Mr. T. L. Morley, 40, King's Road, Reading, would be glad to hear from any prospective members in the locality.

Birmingham M.C.C.

Owing to the action of the Traders' Union withdrawing its support of open events until the English Six Days, the B.M.C.C. has been compelled to make the hill-climb of August 23rd a closed event.

Ilkeston and District M.C.C.

A sixty-five minutes' non-stop trial run was arranged by the Ilkeston and District M.C.C. last week, and three awards were made to the competitors doing the whole course nearest to schedule time.

1. (Gold medal.)—G. A. Calder (4¼ Campion sc.). 65m. 5s.
2. (Silver medal.)—F. Trueman (3½ Premier sc.). 65m. 10s.
3. (Silver medal.)—F. Johnson (3½ Rudge). 66m. 5s.

Abersychan and District M.C.C.

Twenty riders competed in the slow hill-climb recently held. There were two classes, solo and sidecar, the former being won by H. Plaister (2¾ Juno-Villiers), with E. Woolley (4¼ B.S.A.) second, while the first and second places in the sidecar class were gained respectively by W. H. Oliver and F. William, both riding 4¼ B.S.A. sidecars.

Newcastle and District M.C.

A week-end "go-as-you-please" run to Keswick is being arranged for the August Bank Holiday by the Newcastle and District Motor Club. A non-stop section from Keswick to Kirkstone will be incorporated, and also a 20 m.p.h. hill-climb on the return journey. Competition work in the North is being greatly hampered by scarcity of new machines.

N.M.C.F.U. (Leeds).

The run organised recently by the N.M.C.F.U. (Leeds) for the benefit of limbless soldiers still remaining in the local military hospitals was quite a success, despite the weather, and about seventy were taken out to Harrogate and Knaresborough. The intention is to repeat the outing next month for the benefit of those who could not be taken on the first occasion.

A SIMPLE RUNABOUT.

J.A.P. Engine, 85.5×85 mm., 976 c.c. Friction Drive. Chain Transmission.

BUILT on original lines, and of comparatively small dimensions, the 8 h.p. Richardson has several interesting features, particularly in connection with the body and framework.

Although the track and wheelbase are only 3ft. 10in. and 6ft. 9in. respectively, and the total weight is under 6 cwt., the vehicle is reasonably roomy for the normal pair of occupants, and has an excellent turn of speed where gradients are concerned, as we learned on a recent trial run in the hilly districts round Sheffield.

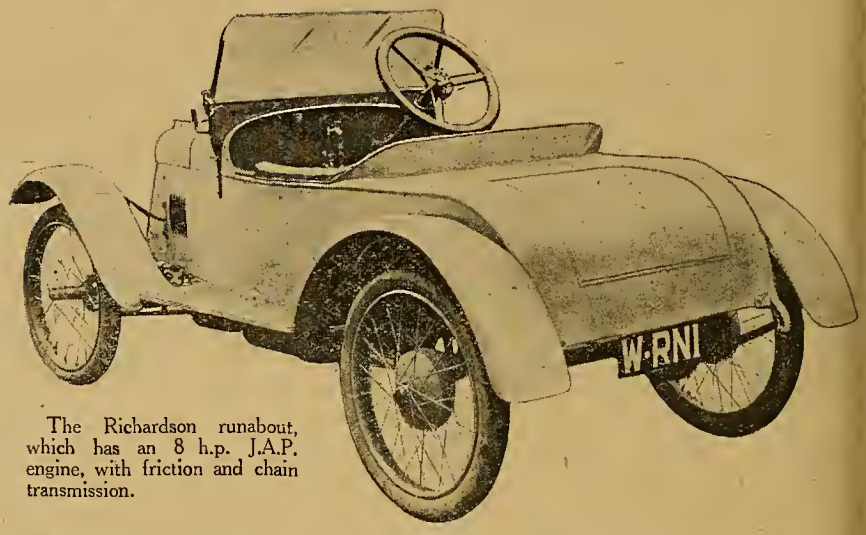
The engine is an air-cooled J.A.P. V type twin-cylinder with a bore and stroke of 85.5 and 85 mm. respectively (976 c.c.) and side-by-side valves. It is supported by four cradle plates across the frame, and, immediately in front of the crank case, the magneto is mounted on a small platform and driven by enclosed bevel wheels from the valve timing gear.

The carburetter is an Amac, controlled by air and throttle levers in the centre of the steering wheel, and gravity-fed from a petrol tank of 4½ gallons capacity housed immediately under the dashboard cowling. Lubrication is by semi-automatic pump and sight drip-feed from an oil tank under the bonnet and next to the petrol tank.

The Transmission Described.

Transmission from the engine to the rear wheels is taken through a friction gear located under the seat. Immediately behind the engine is a large fabric-type universal joint connected to a shaft which rotates the driving friction wheel at its rear extremity. In front of this disc, the shaft is supported by a self-aligning ball bearing in a hinged cross bracket, which, on being moved by the clutch pedal, causes the shaft to move forward and brings the driving disc out of engagement with the driven friction disc mounted on a cross shaft immediately behind it. The forward movement of the driving disc and shaft is taken up by the universal joint behind the engine.

The driven disc, when alterations of gear ratios are required, is moved on its keyways on the cross shaft by a fork engaging with a collar on the friction wheel and connected by a right-angle lever and links to the gear control lever on the right-hand side of the body. Adjustable stops are provided for controlling the maximum movement of both the clutch and brake controls, the former having a special heel pedal to allow of extra pressure being exerted between the two friction discs on abnormally steep hills.

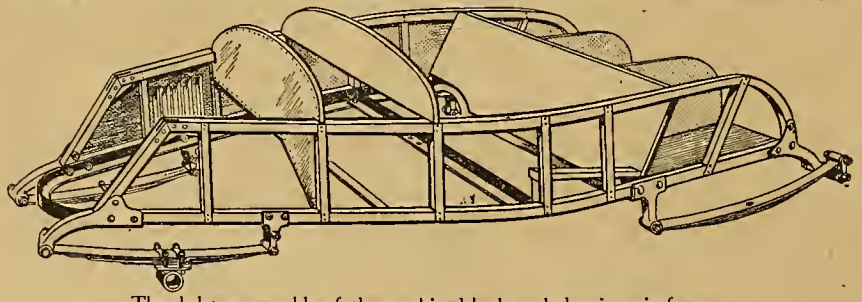


The Richardson runabout, which has an 8 h.p. J.A.P. engine, with friction and chain transmission.

The friction wheels are 13in. in diameter, and four speeds and reverse are provided, the top gear ratio being 4 to 1. A ⅜in. roller chain transmits the drive from the driven disc cross-shaft to a sprocket on the back axle, which has no differential and is supported in large ball bearings mounted in sleeves above the rear underslung springs.

Front view of the Richardson runabout.

Some original features are shown in the construction of the framework and body. The frame proper consists of a length of angle steel, bent in the form of a V, with the rounded corner at the front. On this angle steel construction is assembled the ash framework of the body, as shown in the sketch, and it is built permanently in position in order that the wood and angle steel shall reinforce each other and form one complete unit. By this method it has been possible to produce a light, but strong and flexible, frame, while, at the same time, the accessibility of the engine and transmission is not seriously interfered with, since the framework of the body is built comparatively low to enable the driver and passenger to step over it into their seats. The body is strengthened laterally by metal cross pieces between the angle steel side members and by wooden cross members under the dashboard cowling, while the ash side frames of the body and rear locker are covered by three-ply wood.



The skeleton assembly of the combined body and chassis main frame.

Novel Bodywork.

This built-up combination of chassis and body goes far to eliminate innumerable loose parts and fixing bolts such as are usually found, while the absence of doors likewise makes for lightness, rigidity, and freedom from rattle.

Semi-elliptic springs are fitted fore and aft, the front springs being bolted at an angle on the tubular axle in line with the converging side members of the frame, while the rear springs are of the underslung type.

With a lightweight vehicle of this description the direct steering gear fitted to the Richardson should be satisfactory. Spring clips are employed at the front of the body to enable the dummy radiator and bonnet roof to be detached when attending to the engine. An internal expanding brake is mounted in the hub of each rear wheel, one brake being operated by the hand brake lever and the other by a pedal.

The price of the runabout is provisionally fixed at £175 by the manufacturers, Messrs. C. E. Richardson and Co., Ltd., Finbat Works, Aizlewood Road, Sheffield, and arrangements are being made for deliveries to begin within the next few weeks.

N.E.A.A.

The Motor Cycle Board of the North-Eastern Automobile Association is making arrangements for holding a gymkhana near Newcastle during August.

York-Edinburgh-York Trial.

It has been decided to award a silver cup to all successful competitors (rather than the customary gold medals) in the York and District Motor Club's open trial to Edinburgh and back.

Surplus Motor Cycles from France.

A shipload of motor material from France is on its way to Newcastle-upon-Tyne, when it will be sold by auction by Messrs. Cooper, auctioneers, at the Aircraft Acceptance Park, Town Moor, on July 30th. The consignment includes sixty-eight motor waggons or cars, and a number of motor cycles and pedal cycles.

Sidecars as Taxis.

Our Paris correspondent writes: "Some months ago, when taxi drivers became smitten with the prevalent mania for making excessive profits, permission was given to owners of sidecars to ply for hire. It was thought that Paris would be over-run with public sidecars, but none appeared, and we had forgotten all about them until one was put on the streets a few days ago. This is a Triumph machine driven by its owner. The sidecar is equipped with hood and screen. The lack of enterprise on the part of sidecar owners is very curious, for there ought to be plenty doing amongst that large class of business men who would be glad to use these machines for getting about rapidly, and probably cheaply, for the sidecar owner can well afford to cut his taxi rival, who has become a modern knight of the road. There is quite a large number of English sidecars driven by French owners in Paris. There have never been so many on the streets. The fine work done by these little vehicles during the war has made them very popular amongst the French, and the great majority of those in use are not reformed military machines, but are brand new."

From "The Gazette."

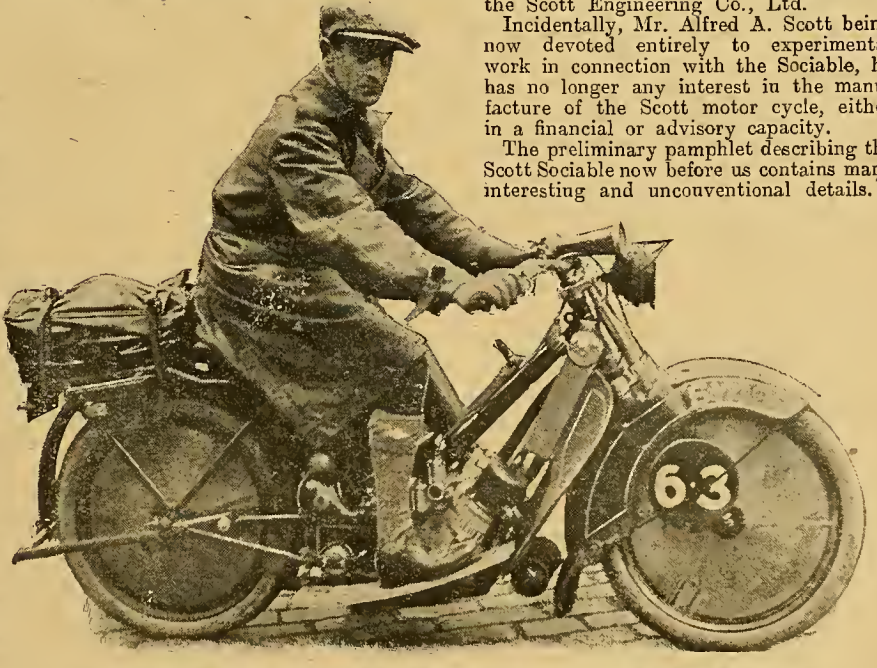
Maj. Brev. Lt.-Col. A. E. Davidson, D.S.O., R.E., was mentioned in Sir Douglas Haig's last despatch. Col. Davidson is a vice-president of the Auto Cycle Union.

Motor Cycles in Canada.

A correspondent from Vancouver writes: "I have just bought a 1912 model Triumph for £21, and it runs like a charm. There should be a good sale for English motor cycles over here. There is a 1919 model B.S.A. and sidecar coming soon, which is the first since the war started, I think."

Motorclub Zuid Holland.

During the mobilisation of the Dutch Army, the Belgian sportsman, Count J. du Monceau de Bergeudal, promised a cup for a long distance competition through Holland. About twenty-five motorists took part in this match, over a distance of 622 miles, which had to be covered at an average speed of 21 m.p.h. for lightweights, and 24 m.p.h. for heavy machines. The competitors, who mostly used American machines, were started from The Hague.



A smart Scott ridden by J. Baker in last week's Scottish Trials. This machine has a specia lubricating system by which the flow of oil to the two cylinders is separately controlled.

Special Features.

INCIDENTS OF THE SCOTTISH TRIALS.
A SIMPLE RUNABOUT.
SOUTHEND SPEED TRIALS.

Flying Ground Wanted.

An airman reader of *The Motor Cycle* wishes to obtain the use of a ground near Coventry conforming to Air Ministry requirements, as follows: To be at least 300 yards square, reasonably good surface, and free from obstructions in the vicinity, such as large trees, etc.

The Scott Sociable.

During the war period three experimental models of the Scott Sociable have been made and tested, and a new company, the Scott Autocar Co., Ltd., Clayton Road, Lidget Green, Bradford, has been formed to manufacture the completed machine. This company has no interest in the Scott motor cycle, which will continue to be produced at Saltaire, by the Scott Motor Cycle Co., Ltd., which, with an issued capital of £80,000, has taken over the business of the Scott Engineering Co., Ltd.

Incidentally, Mr. Alfred A. Scott being now devoted entirely to experimental work in connection with the Sociable, he has no longer any interest in the manufacture of the Scott motor cycle, either in a financial or advisory capacity.

The preliminary pamphlet describing the Scott Sociable now before us contains many interesting and unconventional details.

London-Liverpool-London Trial.

This trial, which was to have been organised by the Liverpool Club to take place last Saturday, has been postponed.

Open Event Cancelled.

Owing to the withdrawal of trade entries from competitions, the Sutton Coldfield and Mid-Warwickshire A.C. motocyclette trial for the Calthorpe Cup was postponed.

Coventry and Warwickshire M.C.

The hon. secretary of the Coventry M.C. (Mr. M. Sampson, 19, Hertford Street, Coventry) would be glad if members who desire to obtain a place in the club team for the M.C.C. Team Trials, to be held in September, will kindly send in their names, together with the makes of the motor cycles they ride (solo or sc.), to him. In the event of a number desiring to take part, an eliminating trial will be arranged.

Sales of Surplus Government Property.

The latest official figures of sales of surplus Government property show that the sum realised is now over £141,000,000. Of the amounts received in one week, the following are noteworthy: Mechanical transport, £272,096; ferrous metals, £131,682; non-ferrous metals, £722,760; and chemicals and explosives, £204,476. The sales of motor cars, lorries, and motor cycles at the Agricultural Hall and Kempton Park are being largely attended. The total mechanical transport sales to date amount to £1,739,000.

Alcohol as Motor Fuel.

Recently, in the House of Commons, Mr. Manville asked the Prime Minister if he would state what action, if any, had been taken to give effect to the recommendations of the Inter-departmental Committee on alcohol motor fuel, that an official organisation, permanent in character and provided with the necessary funds, should be established forthwith by the Government to encourage and develop the production and utilisation of power alcohol as an alternative to petrol. Mr. Bonar Law replied that the matter was now being considered by the Scientific and Industrial Research Authority, with special reference to the recommendations.

Welcome Home for Midland Riders.

Previous reference has been made to a proposal suggesting some form of "welcome" for the returned despatch riders and motor cyclists of the Birmingham district. A committee has now been formed with the object of arranging a dinner and entertainment worthy of the occasion, and Sir William Bowater has kindly accepted the presidency. An appeal for additional subscriptions for this purpose is being made, and in the event of a sufficient amount being forthcoming it is intended that suitable mementoes shall be presented to the parents of those who have fallen and those whose presence is prevented by injuries or military duties. Subscriptions will be gladly received by the following, who will act as the financial committee: Alex S. Ross, 95, Wheelwright Road, Birmingham; Charles F. Dawes, Hall Green Works, Birmingham; Norman T. Downs, 43, Princip Street, Birmingham.

The 1920 Paris-Nice Trial.

The popular trial from Paris to Nice is to be organised in 1920 by M. G. Sweerts, editor of *Motocyclisme*, 1, Cité Paradis (Xe), Paris, France. It is likely that the trial will include the Esterel Road, which is picturesque. Entries from British riders will be heartily welcomed; American, Belgian, Swiss, and Italian teams are also expected to compete.

Improved Roads as War Memorials.

An excellent idea is that put forward in a pamphlet reproduced from *The King's Highway*, and circulated by The Roads of Remembrance Association. It is to improve the roads by removing dangerous corners, building bridges, the construction of "ring" roads round important towns, and the widening and beautifying of existing roads—all this to be done in memory of those who fell valiantly in the war, and suitable inscriptions to be set up recording the facts.

Steel Supply of B.S.A. Co.

We understand that the B.S.A. Co. has proposed to purchase the issued shares of William Jessop and Sons, Brightside Works, Sheffield; the latter firm has supplied the Birmingham Small Arms Co. with all its steel during the last seven years. The Sheffield firm would remain a separate company in the same way as the Daimler Co., of Coventry (which is also allied with the B.S.A.), and would be responsible for the supply of raw material used in the associated businesses.

Capt. W. Strettell Miller (3½ h.p. P. and M), awarded a special prize in the Scottish Trials.

8 h.p. Opposed Twin Light Car.

Readers who have leanings towards the light four-wheeler will be interested in the description of the H.F.G. design which appeared in last week's issue of *The Autocar*. This vehicle is quite on cycle car lines, and comprises flat-twin engine (85 × 110 mm.), aluminium pistons overhead valves, copper-plated steel cylinders with cast iron heads, and has a tubular chassis construction and friction drive.

Petrol Licence Refunds.

The Automobile Association urgently advises motorists who have not yet applied to the Association for refunds in respect of unexpired petrol licences to do so without delay. Unexpired licences with a short request for refund of duty paid in respect of unused vouchers may be addressed to the Secretary, A.A. and M.U., Fanum House, Whitcomb Street, London, W.C.2, up to August 2nd.

STILE COP HILL-CLIMB. Official Results.

THE following are the official figures of Sutton Coldfield and Mid-Warwickshire A.C. hill-climb on the 19th inst. The fastest times were for the most part given in our last issue.

CLASSES 1 AND 2.—FOR SOLO MACHINES (SINGLES AND TWINS) UP TO 275 C.C.

	Time	Formula. Secs.
1. Newey, H. (2¼ Levis, 198 c.c.)	3.167	67
2. Butterfield, W. H. (2¼ Levis, 198 c.c.)	3.088	70⅝

CLASS 3.—FOR SOLO MACHINES (SINGLES AND TWINS) FROM 275 C.C.—300 C.C.

1. Pugh, R. E. (2½ Levis, 293 c.c.)	2.202	65⅝
2. Hall, N. (2½ O.K.-Junior, 292 c.c.)	2.144	75⅝

CLASS 4.—FOR SOLO MACHINES (SINGLES AND TWINS) FROM 300 C.C. TO 350 C.C.

1. Kuhn, G. (2¾ Levis, 349 c.c.)	3.172	51
2. Fidgeon, B. (2¾ N.U.T., 347 c.c.)	2.660	60⅝

CLASSES 5 AND 6.—FOR SOLO MACHINES (SINGLES AND TWINS) FROM 350 C.C. TO 600 C.C.

1. Smith, J. (3½ Triumph, 499 c.c.)	3.136	49
2. Petty, H. (3½ Norton, 490 c.c.)	2.900	50⅝
3. Riddell, H. (3½ Norton, 490 c.c.)	2.795	52⅝

CLASS 7.—FOR SOLO MACHINES (SINGLES AND TWINS) UNLIMITED CAPACITY.

UP TO 300 C.C.

On formula:

1. Butterfield, W. H. (2¼ Levis, 198 c.c.)	3.195	69½

On time:

1. McIntosh, G. J. (2½ Singer, 299 c.c.)	2.629	60⅝

OVER 500 C.C.

On formula:

1. Harveyson, H. R. (6 Matchl's, 770 c.c.)	2.196	50⅝

On time:

1. H. Taylor (8-10 Matchless, 964 c.c.)	1.573	49⅝

300 C.C. TO 500 C.C.

On formula:

1. Emerson J. (3 A.B.C., 398 c c)	3.001	56⅝
2. Smith, J (3½ Triumph, 499 c.c.)	2.964	50⅝
3. Petty, H. (3½ Norton, 490 c.c.)	2.877	49⅝

On time:

1. Petty, H. (3½ Norton, 490 c.c.)	2.877	49⅝
2. Smith, J. (3½ Triumph, 499 c.c.)	2.964	50⅝

CLASS 8.—SCOOTERS.

Skinner, J G (2¾ Autoglider, 269 c.c.)	.997	102⅝

CLASSES 9 10, AND 11.—SIDECAR MACHINES OF UNLIMITED CAPACITY.

1. Emerson, J. (3 A.B.C., 398 c.c.)	2.603	78⅝

CLASSES 14 AND 15.—LIGHT CARS UNDER 1,500 C.C.

1. Godfrey, H. R. (10 G.N.)	1.376	76⅛
2. Underwood, H. (10 Calthorpe)	1.225	101⅛

CLASS 16.—MOTOR CARS (INTERNAL COMBUSTION).

1. Underwood, H. (10 Calthorpe)	1.463	92⅝

CLASS 17.—UNLIMITED MOTOR CARS (INTERNAL COMBUSTION).

1. Hands, L. (25 Talbot)	3.250	54⅛
2. Machlin, N. (10 Eric Campbell)	1.852	75⅛

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

SPARE PARTS.

Sir,—One hears so much these days of discourtesy and indifference in regard to the supply of spare parts that I think, in the interest of motor cyclists generally, you should publish from time to time the names of those firms who treat their customers well. Two firms I can speak well of, *e.g.*, the Enfield Co. and the Watford speedometer people. It is a pleasure to deal with either. Usual disclaimer.

Bristol. SATISFIED.

BENZOLE AND PETROL.

Sir,—For some considerable time past I have been running my motor cycle on locally produced benzole, and had made up my mind that I could in future depend on a home product, and so do without a very good old friend—petrol. It has recently been brought home to me, however, that to drive out petrol is to depend entirely while travelling, either by rail or road, on coal or benzole derived from the same source. At the present moment motor vehicles are the only means of transit, in certain extensive held-up districts of Yorkshire, and people are gladly availing themselves of the use of various motors to relieve an otherwise impossible situation; the obvious moral is to encourage both industries and have two strings to your bow.

Wakefield. LOOKING AHEAD.

PILLION RIDING.

Sir,—I should indeed like to endorse every word quoted by "Live and Let Live" in *The Motor Cycle* of July 24th *re* pillion riding.

I have ridden a 5-6 h.p. Indian with my wife on the pillion carrier for many, many miles, and I am confident that the risk is very small and not nearly so dangerous as combination riding (I have driven combinations), and I am certain there is more sport and pleasure in pillion riding than combination work. It appears to me that the man who shouts "Down with pillion riding" has never taken part in the pleasure, and has no desire for "good sport." In any case, if there is any danger in pillion riding the risk is only run by the riders.

Is it not dangerous to fly, walk, ride in trams, trains, etc., and will not some busybody try to stop these privileges and pleasures also in time to come?

Harpenden. REASONABLE.

Sir,—A good deal of correspondence has appeared in the press lately condemning pillion riding on motor cycles. No doubt there is some reason for condemning *reckless* pillion riding, but why condemn it wholesale when there are those who seek to make it as safe and, in dry weather, even less dangerous than riding in a sidecar? I take it for granted that no sensible person would dream of taking a passenger on wet and greasy roads. My wife has ridden pillion thousands of miles without accident. Once, in particular, when on a journey, if our sidecar had been attached we should have had a serious accident, through no fault of our own, but, as my wife was riding pillion, I was able to take the pavement, and so avert it, which would have been impossible with a sidecar. Of course, I have taken every precaution to make pillion riding safe and comfortable, having fixed a special dress guard and Tan Sad spring seat with foot and back rests. I would suggest that one way of lessening *reckless* pillion riding would be for those who wish to ride in this way to hold a pillion riding licence, which would be forfeited for reckless riding. This licence should be connected with one particular motor cycle, and only the person thus registered would be able to ride. This would prevent inexperienced and reckless persons being taken as passengers. If this mode of riding is prohibited altogether, it will come as a great disappointment to many careful and competent pillion riders. MOTOR CYCLIST.

Porthleven.

ENGINE DESIGN.

Sir,—I recently read an article on motor cycle design, and, dealing with the question of inside and outside flywheels, an assertion was made that the balance of advantage of the outside flywheel over the other type is "overwhelming."

I am not an engineer, but as a motor cyclist of long standing I have ridden every type of machine, including a Blackburne, which, I believe, is the only four-stroke single with outside flywheel in existence.

Personally, I have my own opinions on the subject, and it would be a difficult matter to convince me that the Triumph and Norton singles are less smooth running than the Blackburne, and, in power and speed that they are not infinitely superior. However, my object in writing is, if possible, to elicit from experts in the matter some technical and scientific arguments for and against the two types of engine, as I think your readers will agree that it would make very interesting reading. And if the designers themselves of these three engines could be induced to give us their views from the point of view of balance, speed, power, durability, and accessibility it would serve a useful purpose.

London, E.C. ENTENTE.

A Harley-Davidson descending a steep hill in a country village in Spain Note the *pavé*.

TO HILL-CLIMBERS.

Sir,—May I recommend a new "freak hill." I refer to the track from Ewden Bottom to Bolsterstone, in the Ewden Valley, near Sheffield.

R. W. WILKINSON, Sec.-Lt., R.E.

MERCURY AS AN AID TO COOLING.

Sir,—G. Madge, Major, R.E., does not think the action between Hg and Cu or Al would be serious! Well it all depends on one's idea of what constitutes a joke.

Joke or no joke, I think it would be well to warn the unwary that a small application of mercury to copper or aluminium would render it rotten, especially at high temperatures. W. H. C. BOURCHIER.

PASSAGE TO THE ISLE OF WIGHT.

Sir,—I notice your reference, on page 40 of July 10th, to the ferry charges to the Isle of Wight.

During the last fortnight I have crossed to the island twice *via* Portsmouth Harbour and Ryde with an Enfield combination. The particulars may be of interest to your readers, because no details could be obtained beforehand from the office of the superintendent of the line at Waterloo. There are plenty of joint railways steam packet boats, and there is no cause for delay beyond emptying the petrol. The crossing takes about thirty minutes. The charges are: Motor cycle 1s. 6d., sidecar 1s. 6d., and toll for both on Ryde Pier 1s.

Ryde Pier is rather long, but the officials are kind, and, if one remembers to "hae a wee drappie" put aside, no difficulties are presented. DP 1061.

Twyford.

IGNITION TIMING.

Sir,—I am writing in the hope that any two-stroke owner who chances upon this letter, and who has noticed any unaccountable loss of power in his mount, may benefit by my experience.

My machine (a Calthorpe two-stroke) was recently overhauled at a garage, and the ignition was so re-timed that, with spark fully advanced, the platina were just separating when the piston was at top dead centre. This timing is, of course, too late for a two-stroke. The result was great weakness, and refusal to run with spark other than fully advanced.

Upon re-timing correctly (platina just separating with piston on top dead centre, and spark fully retarded), the engine regained its normal vivacity.

Although this is a very elementary trouble, it is quite probable that it is one from which two-stroke owners will long suffer; for it is remarkable how many mechanics are ignorant of the correct timing for two-strokes.

H. M. SAYERS.

PETROL CONSUMPTION.

Sir,—I would like to bring to the notice of other readers my experience of economy in petrol consumption.

My machine is a 1914 T.T. 2¾ h.p. Douglas with Amac carburetter. I have fitted up the hot air jacket, and, as I wanted to try benzole, which I understood required more air, fitted an ordinary petrol drain tap in the induction pipe just beyond the carburetter. After trying various mixtures I decided that half petrol and half benzole was the best all-round fuel. The machine also ran better with a smaller jet on the mixture than that employed with "pure" petrol. With this mixture and a 27 jet in the carburetter I recently got the following astounding results.

I had my tank, which holds just a gallon, full when I set out from Finchley to Godalming in Surrey. The return journey was made a few days later. On measuring the remainder in the tank I found that there was still half a gallon left. I am not sure of the mileage of this journey (*via* Willesden, Acton, Kew, Richmond, etc.), but it is certainly forty miles each way, giving what seems an impossible consumption of 160 miles to the gallon. The journey was done at a reasonable speed, the outward time being 1h. 45m., and the return 1h. 55m.

At any speed over 25-28 the engine will take the extra air tap in the induction pipe fully open. It is also a great asset for hill-climbing, as, once the throttle is opened over a certain amount, the carburetter does not supply enough air. The movement of the control is, therefore, opposite to the usual method where the air usually requires to be cut down a little on hills. Naturally, the engine is in fairly good tune as regards valves, compression, etc.

I have no interest in any of the firms mentioned beyond that of a satisfied customer.

Apologising for the length of this letter, with which I would not have troubled you had it not been for the hope that the tip might prove useful to other riders who pay attention to the amount of petrol consumed by their mounts,

Finchley. A.A.B.

HOT OR COLD INDUCTION?

Sir,—In reference to Mr. Gleghorn's letter in your issue of July 17th, may I burden your columns with an extension and defence of my article on "Hot or Cold Induction," published on July 3rd?

In the first place, I should point out that space prohibited a complete exposition of the matter. The exact mathematical and thermodynamical treatment alone would probably fill one issue, and, I am sure, would only interest a few.

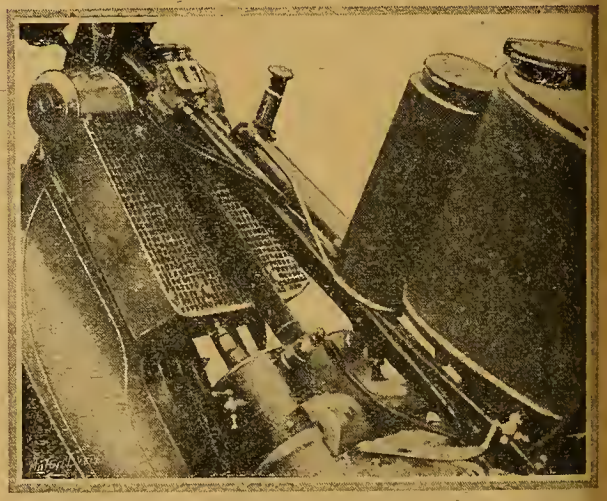
Perhaps Mr. Gleghorn was justified in assuming that the experiments quoted were the sole basis for the opinions expressed, but may I take this opportunity of correcting that idea? Experience, by close contact with a fleet of forty odd motor lorries (principally Seldens), with cars, motor cycles, and an experimental stationary engine of my own, confirmed my conclusions.

I am quite aware that heat has to be supplied to vaporise the fuel, heat obtained almost entirely from the induced air, lowering its temperature thereby. But I doubt whether the air in any carburetter in Mr. Gleghorn's possession ever sinks to the temperature indicated by the intersection of the petrol No. 3 curve (exterpolated) and the horizontal explosion line.

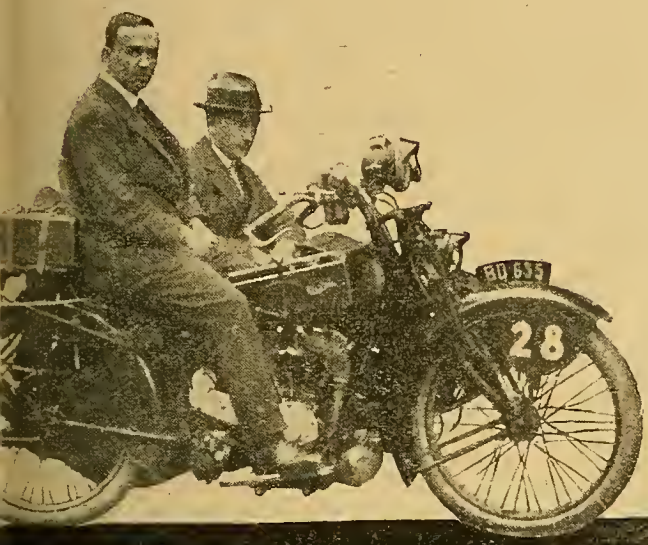
With regard to the question of working speed and gas velocity, I should like to point out that the rapidity of dissipation of the petrol cloud depends on the fineness of the drops, which is itself roughly proportional to the air speed over the jet (the higher the speed the finer the cloud). As I mentioned in the article, whether the air becomes saturated or not, in passing the jet, is the carburetter manufacturer's business. My results merely indicate the physical limit beyond which lies the miraculous. H. J. POOLE.

SUMMARY OF CORRESPONDENCE.

G. R. Martin writes to say that while he was in trouble with a tricar, a motor cyclist offered assistance and finally left his bag behind. This will be restored to him if he will send his name and address, together with particulars of the bag.



A new lubrication system on the Scott ridden by J. Baker in the Scottish trials. A Best and Lloyd drip feed works in conjunction with an R.W.S. two-drip sight-feed. When the B. and L. drip is screwed down oil is sucked by the engine past the plunger and into the R.W.S. drips. By unscrewing the former the whole of the charge passes to the gear.



barred

Cycle—as our machines are entirely new models, which we are particularly desirous of testing under official observation.

Past years have clearly shown that we are always ready to put our products to the severest tests, and we shall do so again as and where circumstances permit.

Meanwhile we have decided to put the above machines—1920 models, mark you—to an even greater test. With this object, our Mr. Frank Smith, and Mr. H. Gibson and Mr. A. F. Knight, are at this moment testing these machines over a course of more than 2,000 miles of even worse roads than the classic competition would have offered.

"TWO" Grains of Salt wanted here ! ! !

Wiseacres will assure you that every advertised statement should be taken with "a grain of salt." That implies a *need for caution.* The Wiseacre will say "Always doubt until you have proved." **We agree.** In fact, we suggest *two* grains of salt, *i.e.*, a *double* dose of **caution.** Our

Coventry-Eagle

3½ h.p. Model with 3-speed Countershaft Gear

can stand even *three* grains if you like. You'll think so too if you study the Photos of this model in our New Catalogue. Illustrations and full descriptions of all our 1919 models. Copy free.

THE COVENTRY-EAGLE Cycle & Motor Co.,
COVENTRY.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Magneto Voltage.

I should be glad if you will kindly let me know the highest approximate voltage of the high-tension and low-tension currents in an ordinary motor cycle magneto.—V.P.

The primary voltage of a magneto rises to about 24 volts. The voltage of the secondary winding at the plug points under normal conditions is 3,000 to 5,000 volts, but it is quite possible to exceed 10,000 volts.

For Tropical Use.

My brother, a Government official in Kedah, F.M. States, is requiring a motor cycle out there to answer the following specifications, as nearly as possible; can you suggest one? 2¾ h.p. two-stroke, two-speed gear box, T.T. bars, foot levers on left-hand side (owing to stiff right leg), footboards, 2¼in. tyres, all enamel, no plating, discs to wheels perhaps, and spring frame; steel tool-boxes, no leather.—S.W.

Several makers of two-stroke machines have a specification very close to the one you require, but there are certain things which would have to be fitted specially for you. We do not know of any light-weight two-stroke at present on the market which has a spring frame. Your best course is to write to several of the leading makers stating your requirements in the hopes of getting some alteration from the standard models.

Scott Queries.

I have a Scott motor cycle, and should be pleased if you will answer the following: (1.) Why does the engine overheat so much as to stop it? (2.) Are both gear chains running whilst on one gear, *i.e.*, when in low gear both the low and high gears are running? Should the high gear be stationary whilst in low gear?—E.S.S.

(1.) The overheating of your engine is probably due to excessive carbon deposit. Other contributory causes may be unsuitable plugs, choked-up and dirty cylinders, and defective operation of air valve dashpot (if Scott carburetter). (2.) Both high and low gear chains run continually. When the high gear is in operation the low gear drum runs freely on the gearshaft and *vice versa*. If you consider the action, you will see that it is necessary for the high gear to be continually running, since the magneto is also driven from it.

Fitting a Gear.

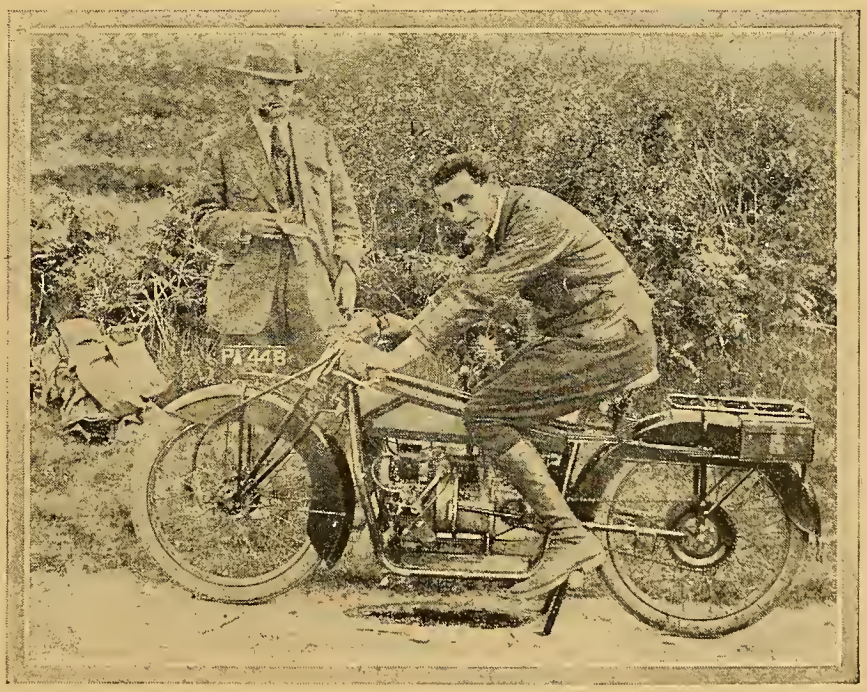
I have a 1913 single gear Triumph, and would like to know if it is possible to fit a Sturmey-Archer three-speed gear, W.D. model as fitted to 1919 Triumphs. The chief point is whether the chain sprocket would fit the crankshaft and yet allow the belt to run true. If this is not suitable, which of the following would you advise and the order of suitability: (1.) N.S.U. two-speed gear. (2.) Sturmey-Archer three-speed hub gear. (3.) Armstrong three-speed hub gear. (4.) The Rigby gear. —C.H.S.

It may be possible to convert your Triumph to countershaft drive, but you would require special rear stays and other fittings. Probably the expense would prove greater than selling the machine and buying a new countershaft model. Of the gears you mention, the N.S.U. may be fitted without alterations. The Sturmey-Archer and Armstrong three-speed hubs involve considerable structural alterations to the machine. The Rigby gear is made to fit Triumph machines, amongst others.

Dry Battery Lighting.

Referring to the dry battery lighting sets advertised in *The Motor Cycle*, I am contemplating purchasing one, but, before doing so, should like to know the following: (1.) Does the head lamp give as good a light as an average acetylene lamp? (2.) Does the light "keep up" after, say, two hours' continuous use? (3.) Do the lamp filaments stand the vibrations and bumps on poor roads? —E.S.

(1.) With four-volt dry battery lighting the illuminating power is not so great as with the large acetylene lamps, but is quite satisfactory at ordinary speeds. (2.) They are more convenient and suitable for short and intermittent journeys than for runs extending over two hours. (3.) Good quality lamps will stand an enormous amount of vibration without filament breakages.



I. Emerson (3 h.p. A.B.C.), who put up a good performance at the recent Stile Cop hill-climb and was in Edinburgh next day for the Scottish Six Days' Trials on the latest A.B.C. Standing is Mr. F. S. Whitworth.

Tyre Wear and Brakes.

To settle an argument, could you tell me whether a brake—other than a tyre brake—has any wearing effect on the tyre, provided the tyre does not drag, *i.e.*, provided the wheel continues to revolve?—A.J.C.

Since a rapid acceleration tends to wear the tyres, it follows that braking, which is merely a negative acceleration, will have a corresponding effect, even though you do not skid the wheel.

Two-stroke Queries.

Having purchased a Connaught two-stroke cycle, I should be pleased if you would advise me if the projection on the piston top goes to the inlet ports or outlet ports; also the best way to time it.—F.B.

The deflector on the piston top should be nearest the transfer ports. Its object is to direct the incoming gases to the cylinder head and prevent them mingling and escaping with the exhaust. Time the ignition as follows: Contact breaker points just breaking, piston on top dead centre, and magneto control lever almost fully retarded.

Belt Slip.

Would you please be good enough to let me know what you consider a good preparation to put on a belt to stop belt-slip? Is Belticum any use, and if so could you tell me where I could purchase it? I want it for sand racing purposes, where one has to go through watersplashes, etc. Is it any use to drill holes in the pulley, say $\frac{1}{8}$in. deep all round?—R.W.

Probably the preparation you require is Belticum, which is sold by the Service Co., Ltd., High Holborn, London, W.C.1. It is quite an effective preparation for use on leather belts, but we have no personal experience of it on rubber belts. For racing purposes it will certainly be of some small advantage to drill the pulley as you suggest; you must take care, however, that the holes are not left with sharp edges, otherwise they will ruin your belts. Under the conditions you describe, it will be necessary to have the belt adjustment exceedingly tight and protected, otherwise you will not be able to avoid slip.

Brakes and the Law.

The other day a country policeman pulled me up for my driving licence; after inspecting my speedometer drive, he asked me how that brake worked. I enlightened him! I explained that I had two independent brakes, hand and foot, fitted to the rear wheel (5-6 h.p. F.N.). He told me that I must have brakes fitted to *both* wheels. How am I fixed in this matter? Both my brakes are in perfect order.—C.M. 338.

The law states that two independent brakes must be provided, but there is no mention of them having to be on the two wheels. You are perfectly in order with both brakes on one wheel.

Misrepresentation.

A few weeks ago I advertised in *The Motor Cycle* for a Sturmey-Archer three-speed wheel, and subsequently bought one for ten guineas, described as in perfect condition, as, indeed, it looked when I received it, and I wrote the seller to this effect. Being very busy, five weeks elapsed before I touched the wheel, which was to replace a free engine wheel in a Triumph frame. Now the Sturmey-Archer will not fit a free engine frame, so not being able to put it in I opened out the gear in my spare time and discovered all the gears broken or stripped, the cages broken, the springs missing from the clutch, but no broken bits inside the hub. I wrote and told the seller, who at once disclaimed responsibility, blaming either the railway or myself. The railway labels are still on the wheel. Would I have a good claim on the seller to either make it good or to refund the money?—R.J.

If you can prove your statements you have very good grounds for a claim against the seller. *The Motor Cycle* deposit system was introduced to avoid such cases.

READERS' REPLIES.

Petroil on a Scott.

In reply to "Scottite," who enquires in the issue of July 3rd, I should like to tell him that I have now driven my Scott for several hundred miles on a petroil mixture of one quart of oil in three gallons of spirit, and intend continuing with it, as I obtain very satisfactory running.—T.W.

Scott Timing.

In my opinion, and I have had much experience of Scotts, it is best to time the ignition with the piston dead on top and the points just breaking when the lever is fully retarded.—H.M.B.

RECOMMENDED ROUTES.

GRIMSBY TO CLAYDON (SUFFOLK).—H.W.

Grimsby, Louth, Spilsby, Boston, Sutterton, Fosdyke, Holbeach Plough, Long Sutton, Kings' Lynn, Stoke Ferry, Mundford, Thetford, Ixworth, Stowmarket, Needham Market, Claydon.

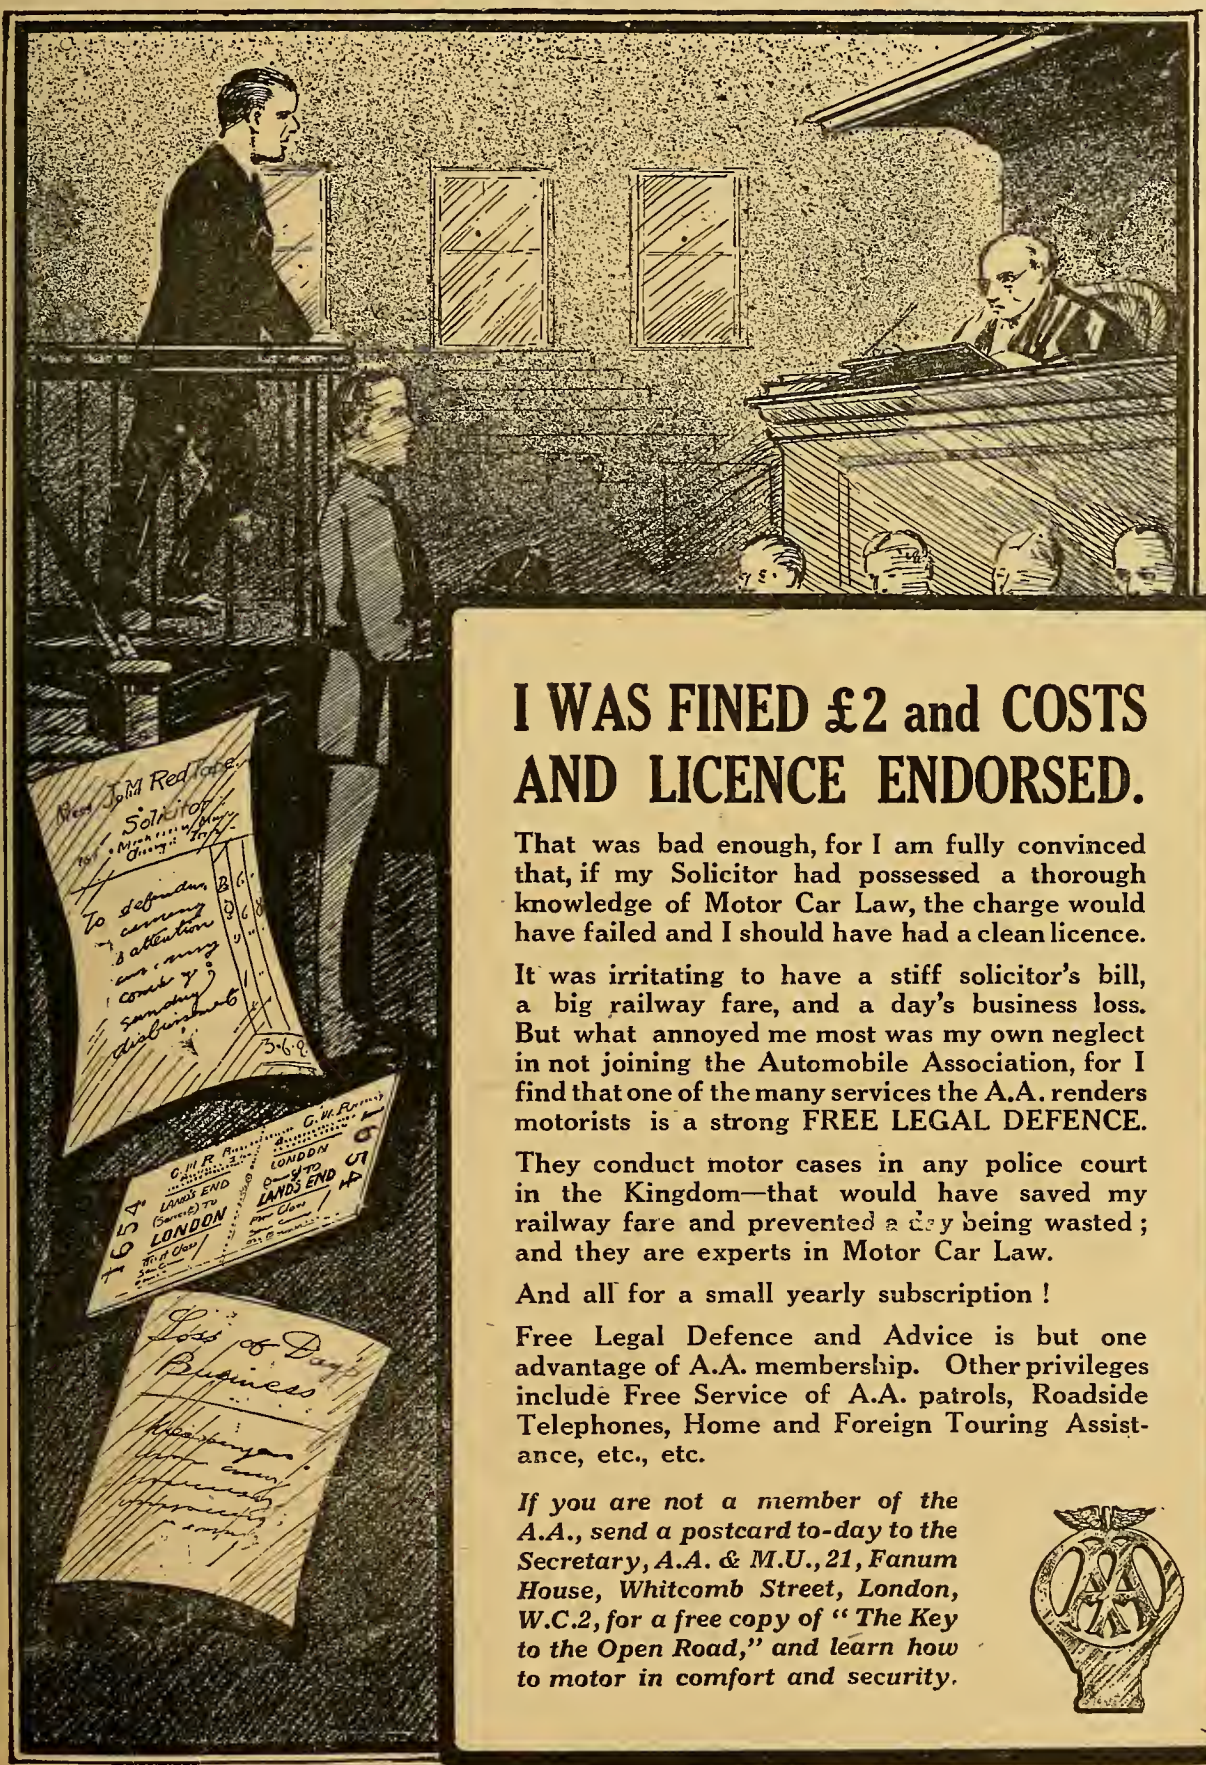
BIRKENHEAD TO BRIGHTON.—F.C.

Birkenhead, Chester, Whitchurch, Hodnet, Wellington, Bridgnorth, Kidderminster, Worcester, Tewkesbury, Cheltenham, Cirencester, Lechlade, Faringdon, Wantage, Streatley, Panghourne, Reading, Wokingham, Bracknell, Bagshot, Bisley, Guildford, Horsham, Brighton. Approximately 240 miles.

PECKHAM (LONDON) TO HUDDERSFIELD.—N.E.

Peckham, Camberwell Green, Kennington, Vauxhall Bridge, Vauxhall Bridge Road, Grosvenor Place, Park Lane, Marble Arch, turn right down Oxford Street, turn left for Baker Street, Wellington Road, Finchley Road, which follow through Barnet on to the Great North Road, and proceed through Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Eaton Socon, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Barnsley, Flockton, Huddersfield. Approximately 200 miles.

The Biella-Oropa hill-climb. The interest of the Italian public is manifest, and no doubt, as in this country, the potential demand for motor cycles has greatly increased since the war. (See page 106.)



I WAS FINED £2 and COSTS AND LICENCE ENDORSED.

That was bad enough, for I am fully convinced that, if my Solicitor had possessed a thorough knowledge of Motor Car Law, the charge would have failed and I should have had a clean licence.

It was irritating to have a stiff solicitor's bill, a big railway fare, and a day's business loss. But what annoyed me most was my own neglect in not joining the Automobile Association, for I find that one of the many services the A.A. renders motorists is a strong FREE LEGAL DEFENCE.

They conduct motor cases in any police court in the Kingdom—that would have saved my railway fare and prevented a day being wasted; and they are experts in Motor Car Law.

And all for a small yearly subscription!

Free Legal Defence and Advice is but one advantage of A.A. membership. Other privileges include Free Service of A.A. patrols, Roadside Telephones, Home and Foreign Touring Assistance, etc., etc.

If you are not a member of the A.A., send a postcard to-day to the Secretary, A.A. & M.U., 21, Fanum House, Whitcomb Street, London, W.C.2, for a free copy of "The Key to the Open Road," and learn how to motor in comfort and security.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

☞ DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

HOME

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

[8643

The joys of motor cycling are manifold—but they are always associated with freedom from mechanical trouble. From the grateful manner in which hundreds have written thanking us for the thorough way we have repaired their

Sturmey-Archer
or
Armstrong Gear

We are justly conscious that we have done our part well.

RECOMMENDED BY THE STURMEY-ARCHER Co

We regret, however, through **heavy pressure on our works at the present time, we cannot undertake repairs at short notice, but you can rest assured that orders will be executed as promptly as possible, while we are now in a position to undertake the immediate repair of Sturmey - Archer 'J.S.' Hubs.**

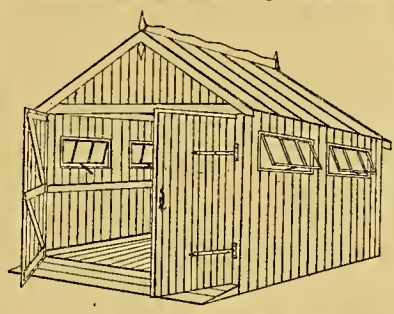
Motor Houses and Cycle Sheds.



Built in five sizes, the three largest sizes made in sections which are mortised and tenoned together, a method of manufacturing which few makers adopt, but it will be evident to anyone that this method is infinitely superior to any other specification.

Specification: Built throughout from ⅞in. selected tongued and grooved and V jointed matchboards in sections as described, to bolt together. Strong double doors, full width of end-hung on extra strong hinges and provided with lock and key and Tower bolts for holding door in position, also handle to door. Range of fixed framed windows in either side, complete with glass, extra strong roof covered with best felt and battened down. Wide barge boards on each end of roof. Sloping platform in front of door to allow of easy access of Cycle or Motor.

Sizes: No. 1, 6ft. long, 5ft. wide, 6½ft. high, **172/3**, floor **35/-**; No. 2, 8ft. long, 6ft. wide, 7ft. high, **245/-**, floor **56/-**; No. 3, 10ft. long, 8ft. wide, 9ft. high **405/-**, floor **100/-**; No. 4, 15ft. long, 10ft. wide, 9½ft. high, **680/-**, floor **210/-**; No. 5, 20ft. long, 12ft. wide, 11ft. high, **830/-**, floor **300/-**. All carriage paid to nearest Station. Prompt despatch guaranteed. Inch boards 20 per cent. extra. See booklet for further particulars.

60, Highdown Road,
Hove, Sussex.

Sir,

Very pleased to receive early delivery of Pillion Seat with Spring Cushion. It is proving most satisfactory. I find the curved padded sides and low seating are a great comfort to the passenger and an advantage which effects perfect balance. Shall be pleased to recommend same.

Yours faithfully,
H. C. HOUGHTON.

W. J BRADLEY, Patentee and Manufacturer,

MORGAN, 1915, water-cooled, sporting, hood, screen, speedometer, Lucas lamps, perfect; £150.—17, Tamworth Park, Mitcham. [8431

DUO Cycle Car, 8h.p., 2-seater, J.A.P. engine, hood, screen, lamps, horn, in good condition; £97/10.—12, Bridge St., Cambridge. [X7502

A.V. Monocar, 1919, not done 300, 5-6h.p. J.A.P., Zenith carburetter; best offer over £115.—J. D. King, Broom, Biggleswade, Bede. [X7315

A.C. Sociable, 1911 model, run under 6,000 miles, hood, side and back lamps, wind screen, etc.—Write, Lucas, Holmbush, Ide, Exeter. [8235

THREE-WHEELED Runabout, 4½h.p., w.c. Aster engine, 3 speeds and clutch, hand and foot brake; £26.—Deacon, 13, Ewhurst Rd., Brighton. [X7574

LANCASHIRE (except Fylde) and Cheshire Only.—A.V. monocar; enquiries invited.—J. Blake and Co., Official Dealers, Liverpool-Manchester. [7037

A.C. Sociable, hood, new tyres, tubes, good condition; £85, or exchange combination or solo and cash.—Long, 134, Cherry Orchard Rd., Croydon. [8387

1915 Carden Monocar, 6h.p. J.A.P., Bosch, Zenith, 4-speed; low price for quick sale; stamp for particulars.—Barham, 24, Broad St., Truro, Cornwall. [X7412

CYCLE Car 2-seater, new body, gear box, live axle, twin engine, wire wheels, wants fitting up, a few parts missing; £20, or will sell in parts.—Bristow, 11, Richmond St., Brighton. [X7335

MORGAN-J.A.P., A.C., bought before the war, but has been carefully stored most of time, just been repainted and engine overhauled, splendid running condition, complete with hood, screen, lamps, 3 electric and 1 powerful acetylene head light, tools, spares, etc.; £125.—Ex-Chaplain, Hyde Vicarage, Winchester. [X7366

FOR Immediate Sale, 8h.p. 1916 Morgan runabout, De Luxe Model, J.A.P. air-cooled engine, lately overhauled and tuned up, the whole in first-rate condition, including tyres; first offer of £175 secures.—Apply to J. D. Stobart, 1, Durham Place, Smith St., Chelsea. [8622

CARDEN Monocars, 1919 models, 8h.p. J.A.P. engine in front, Sturmey-Archer 3-speed gear box, seat, kick starter, weight 3-cwt., consumption 80 m.p.g., admirable for business or pleasure; 120 gns.—Sole Concessionnaires, The Railway Garage, Staines. 'Phone 139. Call and take trial run. [8264

MORGAN G.P., water-cooled J.A.P. engine, hood, screen, spares, valves, tappets, dynamo lighting, with inspection lamp, electric horn, speedometer, tyres 700×80 oversize, all in good condition with one new spare, good running order; would give a 50 miles trial run, or would consider a good lightweight in part exchange; price £175, or close offer.—2, Meyrick St., Pembroke Dock, South Wales. [8022

CARS FOR SALE.

PHŒNIX 10h.p., 2-cyl., 4-seater, smart; £150.—Railway Garage, Staines. 'Phone 139. [3266

6h.p. Peugeot 2-seater, less tyres and mag., good engine; price £50.—123, Woodstock Rd., Oxford. [X7425

PILOT Car, 8h.p., thoroughly reliable, engine running order, accessories; £100.—36, Napier Av., Hurlingham. [8676

10h.p. Twin 2-seater Light Car, Blumfield engine, w.c., electric side and tail; nearest £150.—Hill's Garage, Woodford Wells, Essex. [8675

9h.p. Renault 4-seater, 2-cyl., 3 speeds, reverse, live axle, hood, screen, running order; £70.—Murray 37a, Charles St., Hatton Garden, Holborn. [X7542

CARS FOR SALE.

2-SEATER Car, 8-10h.p. J.A.P. engine, Bosch mag., B. and B. carburetter, splendid condition, ready to drive away; trial run given; £150.—W.H.C., 256, Fore St., Edmonton. [8329

SWIFT 7-9h.p. Baby, staggered seats, 3 speeds and reverse, live axle, hood, screen, lamps, just been overhauled and repainted; £190.—158, Rosendale Rd., West Dulwich, S.E.21. [8030

8h.p. Morgan, 1914, J.A.P., complete with hood, screen, lamps, front and rear, 2 spare chains, in perfect running order; first cheque secures, £165.—The Sidney Motor and Cycle Depot, 29, Green St., Cambridge. [8141

DOUGLAS S. COX, The Absolutely Straight Motor Man, 6c, Lansdowne Hill, West Norwood, S.E., has all the following actually in stock. Please call. Hours: 9 to 6.30, including Saturdays. No business Sundays.—Below.

8h.p. De Dion Chassis, 2-speed reverse, £25; 9h.p. chassis, single-cyl., running order, £50; 6h.p. De Dion 2-seater, magneto, Solex, £65; 16-20h.p. Sunbeam chassis, 4-speed, gate, £75; 12h.p. Minerva van, magneto, 3-speed, £85; 12h.p. Darracq traveller's brougham, £90; 12h.p. Darrack 4-seater torpedo, smart, £95; 16-20h.p. Clement van, Zenith, magneto, £100; 12-18h.p. Riley van, detachable wheels, Zenith, £100; 18-24h.p. Deasy chassis, monobloc, enclosed valves, £125; 14-16h.p. Darracq traveller's 'bus, monobloc, £150; 10-14h.p. Renault chassis, late type, £150; 18h.p. Vivinus torpedo 3-seater, £150; 12h.p. Unic lorry, Zenith, magneto, good, £150; 24h.p. Wolseley chassis, gate, dual, £175; 20h.p. Cadillac 2-seater, gate, £185; 20-28h.p. Darracq van, 4-speed, gate, £185; 12h.p. Unic taxicab landaulet, £195; 15h.p. Charron landaulet, repainted, £200; 10h.p. 2-cyl. De Dion 2-seater, dickey, £225; 20h.p. live axle Daimler lorry, Zenith, £225; 12-16h.p. Mors chassis, monobloc, gate, £250; 15h.p. Charron ¾ landaulet, pointed radiator, £250; 13.9h.p. Jackson torpedo, Chapuis-Dornier, £285; 14-16h.p. Fiat van, monobloc, gate, £285; 11.9h.p. Briton torpedo, detachable wheels, enclosed valves, £295; 15-18h.p. Buick torpedo, gate, detachable rims, £315; 10h.p. 1915 Singer streamline 2-seater, £315; 11.9h.p. Colibri streamline torpedo, £325; 10h.p. 1914 Singer, dynamo, detachable wheels, £325; 1915 Studebaker 4-seater, streamline, £350; 30h.p. Bronhot 2-seater, 70 m.p.h., racer, £350; 15.9h.p. Arrol-Johnston 2-seater, detachables, £385; 13.9h.p. Sperber streamline torpedo, £385; 1-ton Clydesdale lorry, 1915, £385; 60h.p. Napier tourer, live axle, £450; 16-20h.p. 1915 Wolseley chassis, £500; 14h.p. De Dion super taxi, 1913¾, pass S.Y., £550; 12h.p. Knight-Daimler Coupe, 4-cyl., dickey, £550; Rolls-Royce sporting 2-seater, 20h.p., 4-cyl., £575; 12-15h.p. 1913½, Fiat ¾ landaulet, £585; 1914 Sunbeam 12-16h.p. chassis, overhauled, £600; 1914 18-24h.p. Siddeley-Deasy chassis, £650; 1915 16-22h.p. Napier chassis, £700; 1914 Sunbeam 12-16h.p. torpedo, almost new, £775; Prince Henry Vauxhall sports 4-seater, £850; 1915 Sunbeam torpedo, high radiator, underslung, £875; 1916 20h.p. Knight-Daimler chassis, cantilever, £900; 1914¾ 20h.p. Daimler interior drive saloon, £1,325.

COMMERCIALS (twin solid tyres).—2-ton Milnes-Daimler van, Zenith, 4-speed, £90; 1-ton Lacre van, magneto, gate, £175; 1¼-ton Berliet lorry, 18-24h.p., Zenith, £185; 3-ton De Dion chassis, worm drive, late, £200; 3-ton Milnes-Daimler chassis, L.G.O.C. engine, £250; 3-ton De Dion lorry, worm, enclosed valves, £295; 3-ton 1914 Seabrook lorry, £385; 3-ton 1915 Seabrook, enclosed valves, gate, £450; ditto, overhauled and all new tyres, £525; 2½-ton 1914 Karrier platform lorry, O.H., £550, 30-cwt. Dennis lorry, latest type, £550; 2-ton 1915 Burford lorry, overhauled, £585; 3-ton 1916 Vinot lorry, worm, monobloc, £625; 3½-ton 1914 Napier, overhauled, new tyres, £685; 4-ton Scout workshop lorry, worm, £850.

ABOVE are all absolute bargains, some completely overhauled and almost equal new. Call and you're sure to find what you want.—Douglas S. Cox (above). [8587

10h.p. Morris-Oxford 1914 De Luxe Model, fully equipped with hood, screen, speedometer, watch, original paint, in nice condition; £350; motor cycle and sidecar, or motor cycle taken as part payment.—Wauchope's, 9, Shoe Lane, Fleet St., London. [8621

DE DION 8h.p. Single-cyl. 2-seater, with platform behind for luggage or passengers, 3 speeds and reverse, quadrant gear change, leather hood and apron, lamps, speedometer, tools, Stepney, all good tyres; ready for any journey; £90, or exchange.—Bunting, Masons Av., Wealdstone. [8656

10h.p. Alldays Light Car, small 4-seater body, 2-cyl. engine, 3 speeds, reverse, complete, and guaranteed in good running order, £95; also 10h.p. Napier, 4-cyl., mag., Zenith, small covered van body, suit traveller, or light trade, guaranteed in perfect order; any trial, £140.—Yates, 101, Tubbs Rd., Willesden Junction, N.W.10. [8371

RAILWAY Garage, Stains ('Phone 139), offer: 4-seaters—Phœnix £150, Swift 7-9h.p. parcels van £195; 2-seaters—smart Sizaire, 10h.p., quiet, £145; smart Whiting-Grant, electric starting, lighting, dickey, £275; Vauxhall 25-30h.p., de luxe hotel tender, £750, nearest; Carden monocars, 1919 models, 120 gns.; call and inspect, week-days only; close 7.30. Cars bought. [8265

ENGINES.

8h.p. 1917 Second-hand Twin J.A.P.; £25.—Brookes, 141 New Kent Rd., S.E. [7933

F.J. YOUNGS

For the Summer Holidays.

SIDECARS from £20 to £32.

Lamps sets from 32/6. Horns from 12/6. Tools, every description.

Spares for

A J S., Morgan, J.A.P., B.S.A.

EASTING WINDSCREEN, 90/-

Racing Helmets, post free, 11/- Solid leather belts, post free, 3/9.

Tyres, all makes and sizes. Belts, all makes and sizes. Chains, all makes and sizes. At to-day's list price.

The Importance of Research Work.

WE have previously urged the great desirability of the formation of a communal research laboratory, and pointed out how, if manufacturers, or at least the most prominent firms, combined in this matter, Government assistance might be obtained, and very great results reached at a minimum of cost.

In the first place, the great advances which have been made in metallurgy have given the designer a great variety of most excellent materials suitable for every part. By varying the heat treatment, the same piece of steel can be made to give very different results, and its tensile strength altered accordingly. In consequence, by choosing for every separate part that material most suitable to withstand the strains to which it is subjected, a great saving in weight can be secured in the whole engine. This is desirable, not only for itself, but because lightness in the moving parts, the reciprocating parts in particular, removes a large amount of stress from the bearings, which are at present far too small in most motor cycle engines for the loads they have to carry. Light reciprocating parts also mean great powers of rapid acceleration.

So much for strength and lightness! Secondly, very greatly improved cooling will result from a wise choice of those metals which are best able to conduct the heat quickly to the outside of the engine, where it can be dissipated into the surrounding atmosphere. In this respect, copper and aluminium (with its alloys) are vastly superior to cast iron. Moreover, the latter can, weight for weight, be made very much thicker, this in itself aiding considerably in the rapid conduction of heat.

In thus sketching briefly a few of the advantages which will naturally follow the formation of a research laboratory, we do not for a moment suggest that we have exhausted its possibilities, but merely touched their fringe.

Water-cooling.

A WRITER recently contributed a few practical notes on the subject of water-cooling, which in these days of efficiency and change is one we should not entirely overlook. Our own experience of water-cooled motor cycles—and we believe the experience of most of our readers acquainted with them—has been highly satisfactory, and there is one side to the question which should not be ignored, viz., the matter of economy.

A water-cooled engine can be run normally at a much wider throttle opening than can an air-cooled engine, which means a higher output of power per c.c. Thus a small water-cooled engine, running at threequarter throttle, maintains the same power output over a given distance as, say, a 700 c.c. running at quarter throttle, and the question arises as to whether the small engine is sufficient for the needs of a certain class of rider who desires reliability and economy above all other merits. In car practice we have comparatively small water-cooled engines running normally at almost their full power output; when a gradient is encountered the gears are utilised, and owing to the "revving" capabilities of modern engines very little time is lost. In motor cycle practice we have large engines, which normally run on a much lower gear than is necessary in order that hills may be taken without changing gear. This is very pleasant, just as it is pleasant to possess a high-powered car which has sufficient reserve to ascend all normal gradients on top gear, but the expense of maintaining such a car is enormous!

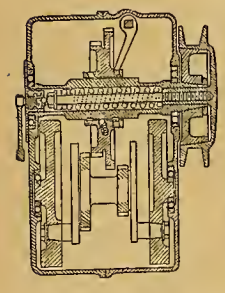
We incline to the opinion that there still remains some opening for a light, water-cooled sidecar outfit, designed essentially for economy, and having a sufficient range of gears to enable it to compete successfully with, say, the 10 h.p. light car as regards road speed. There is no reason why such an outfit should not be capable of an average petrol consumption of 120-150 m.p.g., and great economy in oil.

An Index to the advertisements in this issue will be found on the page facing the back cover.

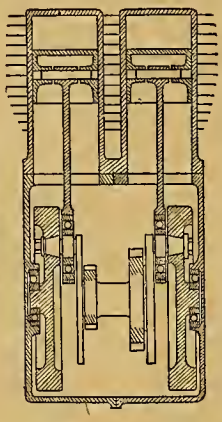
ANZANI MOTOR CYCLE ENGINES.

New French Designs.

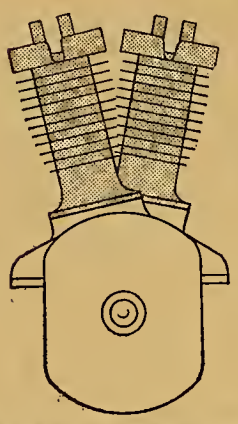
ANZANI, the Franco-Italian one-time motor cyclist, later an aviator, and now an engine designer, is responsible for an interesting motor cycle engine, in which the engine and two-speed gear box form a complete unit. The engine has two cylinders, 60 mm. × 90 mm., 508 c.c., and is said to develop 5-6 h.p., and in order to secure even torque both pistons are arranged to rise and fall together, the crank throws being side by side with the primary gear wheels between them.

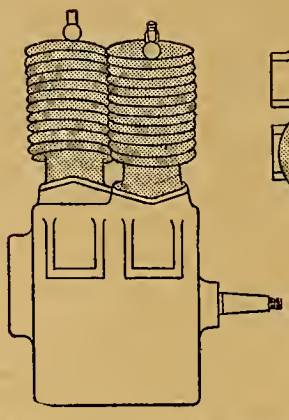


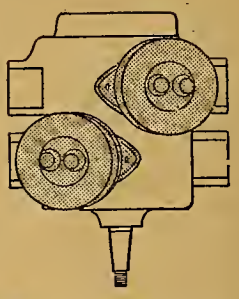
Plan view of the gear box, which is integral with the crank case.



Cross section of Anzani's unit, showing the main drive pinions integral with the main-shaft.







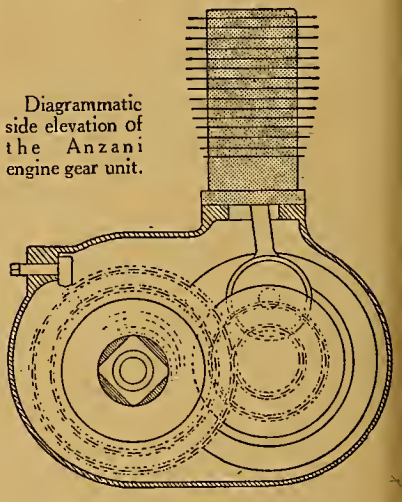
M. Anzani's unconventional V twin with cylinders set at 30°.

There are two internal flywheels running on ball bearings, with the low and high-speed pinions cut out of the solid on the short crankshaft midway between the two cylinders. The two sliding pinions are mounted on the secondary shaft, which also runs on ball bearings. At one end of the hollow countershaft is the clutch, upon which the driving pulley is mounted. Overhead valves are worked from a camshaft, the valve mechanism following aviation practice.

A V Twin.

M. Anzani is also producing a V engine for a cycle car, but the angle at which they are set is an extremely small one, the object of which is to reduce the irregularity of the firing intervals as much as possible, and to simplify the ignition. The cylinders are staggered, consequently forked connecting rods are not necessary, and better cooling should result when the engine is placed with its crankshaft across the frame. The bore and stroke are 75 mm. × 125 mm. respectively, and the capacity 1,104 c.c., while the power developed is stated to be 12-15 h.p. The lubrication is by pump.

In view of the success of Anzani with his aviation engines, it is reasonable to suppose his motor cycle engines will be well finished and efficient.

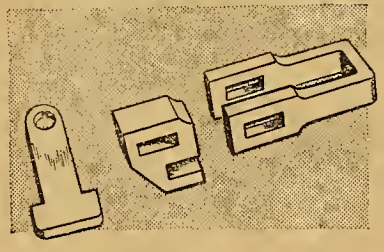


Diagrammatic side elevation of the Anzani engine gear unit.

A Thief-proof Lock for Gear Levers.

THE device shown in the illustrations is principally intended for sidecar combinations, and is designed to fit on the quadrant bracket and secure the gear lever in a "neutral" position, so rendering the machine unusable under its own power except to an authorised person.

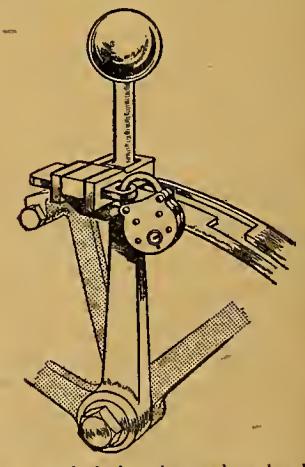
The attachment consists of three pieces of hard steel or phosphor-bronze, which, on being fitted together, lock the gear lever immovably on the quadrant bracket. A forked link is slipped over the gear lever in a horizontal position until it engages with a stout metal block attached to the arc of the quadrant bracket. A pin of substantial proportions is then passed through slots both in the link and block, and secured by a padlock to prevent removal.



The locking members of the Dewar device

This device can readily be fitted to machines where the gear lever has to be moved sideways into a slot in the bracket; on shifting from any gear to "neutral," as when the lever is locked by the forked link, no transfer from neutral to any gear can be negotiated, since the lever cannot be moved sideways. In the case of motor cycles fitted with gear levers having a straight run through from one gear position or another to neutral with no lateral movement, then the block to which the link is held in the locking process is either brazed or riveted to the quadrant bracket.

Arrangements are being made by the makers, the Dewar Manufacturing Co., 7, Houndsditch, London, E.1, for this attachment to be adaptable to most makes of machines at a moderate price. For medium or heavyweight sidecar combinations, which are not easily stolen at a moment's notice, the device should be very useful, and it has the advantage at the same time of being very handy and convenient to operate.



Gear lever locked to the quadrant bracket

Dismountable Plugs.

IN 1914 every motor cyclist's junk corner was piled high with dud sparking plugs. This was not altogether the fault of the rider or of the sparking plug manufacturer. If riders devoted insufficient attention to accurate lubrication, and if manufacturers designed plugs which could only be cleaned by stewing them in vitriol, it must be conceded that the average motor cycle engine did not possess a lubrication "system": in lieu of that necessity, it was usually disfigured with an oil tank, a hand pump, and a flywheel bath. It was hoped that within the near future all motor cycle engines would be equipped with a systematic lubrication; and I am still sanguine enough to cherish such dreams, believing that oil-cooling is no longer a necessity, that the demerits of colossal piston friction are being recognised, and that ball or roller bearings will oust the quondam phosphor bronze bush of insufficient area. Be that as it may, certain sparking plug makers are coming to our rescue with plugs which can be taken to pieces and cleaned by any duffer in two minutes; yes, and refitted with a pukka gas-tight joint at the first attempt. Needless to say, any rider afflicted with an oily engine or careless lubricating habits should confine his custom to such plugs.

Running to Time.

ONE of the first essentials of transport is that it shall be punctual. Some of us admittedly use our motor cycles for pleasure, and can put up with roadside delays of half an hour or so on occasions. Others again employ machines on business, but the duties are not super-urgent, and the user's time is not necessarily spaced out in minutes, so that delays are not unpardonable. But a third class of motor cyclist rides under conditions resembling those of a six days trial, when a quarter of an hour spent on tyre repairs may prove very serious and even expensive. Manufacturers have already eliminated the risk of grave mechanical trouble. On the modern machine we expect to ride out and home in one piece, with two conceivable exceptions. The first exception is of a trivial nature, and relates to the momentary stoppage required to tighten a nut, adjust a belt, or change a plug. The second exception is of a graver character, and consists of the risk of tyre troubles. Tyres, as they are now constructed and fitted, are the Achilles heel of the modern motor cycle. They are responsible for our chief anxieties on urgent rides. They are to blame for our late arrivals or alternatively for those absurdly early starts by which a canny rider ensures himself against failure to keep an appointment.

For Example.

IT is, of course, true that any practised rider can mend an ordinary puncture in a quarter of an hour with the modern quick-drying solutions of the holdfast type. It is also true that a standard tyre may stall a clever motor cyclist indefinitely without the least warning. Only last week a member of our staff was held up on the road because the valve patch of his rear tyre peeled clean off the inner tube, and his repair kit (like most such outfits) contained no patch large enough for the tricky job which resulted. Or, again, a tyre valve may rip clean out of a tube if a large puncture is sustained at speed. Or a broken bottle may gash a cover across from bead to bead. Or a hidden flaw in a casing may cause part of the bead to come away from the wall. Or a speed puncture may practically destroy a new inner tube. Such catastrophes are not of daily occurrence, and some riders have been on the roads for years without once encountering such a Waterloo. On the other hand, there are few veterans who cannot cite several occasions on which they have been absolutely and completely stalled for several hours by tyre trouble of the more serious type. Such trouble may attack any of us without warning. In the long run no regular road user can escape it.

Provision Against a Tyre Hold-up.

THE only motor cyclists who enjoy absolute immunity from a tyre hold-up are those sidecar merchants who use detachable wheels, and always carry a spare cover and tube complete. The rest of us are perennially at the mercy of our understandings. Manufacturers do not trouble to equip our machines against such contingencies. The new machine, costing perhaps over £100 in these days, is not provided with a spare tube. Its repair outfit must often be bought separately, none being included in the purchase price. When bought, the repair outfit seldom contains a valve patch: spare valve tubing is quite criminally omitted from many kits: the supply of French chalk is only adequate for one good-sized repair; and the largest patch is only sufficient for a half-inch tear, and quite useless for a bad nip, blow-out, burst, long gash, or irregular tear caused by running off the impetus after a puncture at high speed.

Some Possibilities.

IT is clear that existing tyre conditions are grossly unsatisfactory from the standpoint of a rider who wants to keep time. They compare unfavourably with the insurance against long stops provided on every first-class sidecar, cycle car, and motor car. It is thinkable that Mr. Rapson may presently furnish us

Occasional Comments.—

with unpuncturable tyres. If he disappoints us, what remains to be done? The following suggestions are the commonplaces of six days trial work, and should be adopted by all motor cyclists who ride for business purposes:

1. Always carry a properly stored inner tube in reserve.
2. Supplement the standard repair kit by an extra supply of very large patches, valve tubing, a large gaiter for protecting damaged parts of the cover, and a big tin of French chalk, carefully packed.
3. If the riding be done over really bad roads in lonely districts, a spare cover should be carried (light covers may be rolled round the tank to serve as knee grips).

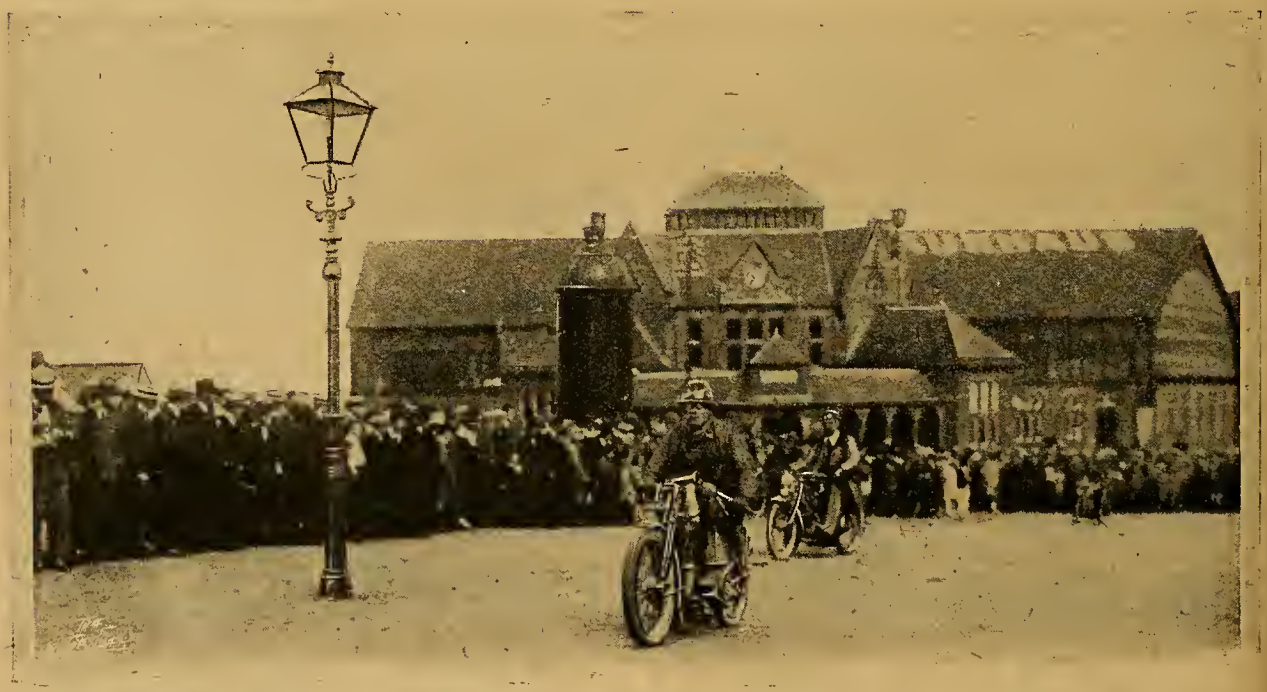
These precautions are doubly necessary in the present day, when it is far from certain that even a big garage can produce either tubes or covers in any desired size.

Jointed Inner Tubes.

THE above precautions furnish no guarantee against prolonged roadside delays when a peculiarly wicked tyre stop is encountered; they merely ensure the continuance of the journey after a greater or less delay. What we need is insurance against lengthy delays of any kind. In other words, we need one of three alternatives:

1. An unpuncturable tyre.
2. A drop-out back wheel.
3. Jointed inner tubes.

The first remedy is still problematical. The second is less common than it was a few years ago, when belt drive plus a T.T. type of rear spindle enabled a duffer to clear his back wheel, fit a new endless tube, and take the road again, all within ten minutes. Some of the modern knock-out spindles and drop-out wheels are extremely ingenious, but they are neither foolproof nor universal. I have known a rider spend ten minutes in getting such a wheel out, and another ten minutes in getting it back. Only the other day I had to change a rear inner tube on a modern machine which was not fitted with a drop-out wheel; I got the wheel cleared in about ninety seconds, but it took me a quarter of an hour to get it back, since four hands were really needed for the job. In other words, there is still a great opening for detachable inner tubes. None have been advertised since the Armistice. In pre-war days I searched in vain for the perfect jointed tube. The Rich, with its continuous air chamber, was excellent; but its joint was apt to leak when the caulking of castile jelly had perished with age and heat; the caulking was easily renewable, but riders dislike carrying a squashy tube of dope in their toolbags, or being stopped on a pleasant run to airproof a tube which is not punctured. The butt-jointed pattern of tube has never proved as reliable as the endless type. I have had excellent service from some of them; but sooner or later the butts chafed into a leak of some kind. We have quite enough trouble with the endless tube, and do not want a tube which contains extra possibilities of annoyance. It is for this reason, presumably, that motor cycle makers continue to fit endless tubes, instead of delivering each machine with three jointed tubes. I submit that every rider should carry three tubes as a precaution: two in his covers and one in reserve. If his rear wheel is not of the drop-out type, these tubes should be jointed. It is up to the tyre trade to produce either an unpuncturable cover or a genuinely reliable jointed tube. The standard of reliability and timekeeping has stiffened. Motor cycles must compete with vehicles which can run to time. They require absolute insurance against prolonged tyre stoppages.



The interest of the public in motor cycle matters in Holland is very keen, judging from the photograph above, which shows a rider arriving at Scheveningen on the occasion of a long-distance competition for a cup presented by Count J. du Monceau de Bergendal. This trial was referred to in last week's issue on page 127. —*De Auto.*

Shortcomings of Motor Cycle Engines.

Some Impressions and Deductions derived from a Study of Aero Engines Part I.

SINCE the introduction of the high-tension magneto, remarkably little improvement has taken place in motor cycle design. It is true that detail improvements have been made in many directions, which have contributed to the general reliability and (in some cases) efficiency of present day machines, but with the exception of these details there is little difference between such machines as, let us say, the Triumph of 1907 and the present day single-cylinder.

This stagnation in design is caused to a large extent by the fact that motor cycle manufacturers (with one or two notable exceptions) have not kept up with the advances made by modern internal combustion engineers, steel manufacturers, etc., and, in brief, have contented themselves with turning out good selling models without worrying about the mechanical possibilities of the future. Commercially this may have been all very well in the past, but with the spread of engineering knowledge amongst the buying public it is not likely to be a successful policy in the future.

The war has taught us many things, and anyone who has been intimately connected with aero engines during the last five years will admit that he has learned more in that time than in any previous period.

Undoubtedly the experience gained from aero engines is going to have a great effect on motor cycle engines, not perhaps immediately, but as soon as manufacturers have adapted themselves to altered conditions.

The most outstanding evils of motor cycle engine construction are: reciprocating parts of approximately twice the necessary weight; totally inadequate bearing surfaces, especially big end bearings; absence of lubrication system; and bad distribution of cooling surfaces: and these evils are mainly due to the fact that designers have insufficient knowledge of the subjects or are content to turn out "something that will work."

Experimental testing plants, or at any rate testing plants from which really accurate data are obtainable, are vitally necessary, and yet such plants are probably confined to one or two firms whose goods are of world wide repute.

I am aware that the foregoing remarks may sound unduly critical to some ears, but it is hoped that they will be taken in good part, for the motor cycle industry is sadly in need of a "shake-up."

Experimental Work.

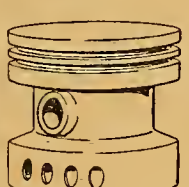
An enormous amount of experimental work has been carried out during the war, old ground has been covered and re-covered, with the result that some old theories have been confirmed and others have been exploded. Much new ground has been ploughed and many interesting possibilities have been brought to light. Some of the information obtained has been published—much more will be published—and unfortunately a small proportion will probably be kept secret, and remain in the hands of one or two firms for some time to come.

Yet in spite of all the work which has been done, an ever growing wall of research work appears to be necessary—the more that is known the more there is that needs to be known. I hold the Utopian idea that one of these days a laboratory will be instituted for research work on internal combustion engines (which will be supported by the State or by manufacturers), and that the results obtained from this laboratory will be published for the use of every one concerned, or at least for the use of such firms as support the institution. [This has already been advocated in *The Motor Cycle*.—ED.] If such an advance were ever brought about motor cycle manufacturers would have not only to support it vigorously, but also to insist that experiments suitable to their requirements be carried out.

And here comes a word of warning: remember that a feature which may be eminently suitable for aero engine work is not necessarily suitable for motor cycle work. The experiments carried out for the benefit of aero engines are almost invariably on engines having considerably greater volume per cylinder than is the case in motor cycle engines, and though this in itself is an advantage rather than otherwise, the conditions under which an aero engine runs (as regards cooling, constant speed, etc.) are very different from those obtaining in motor cycle work.

As an instance of the need for this warning, a rumour obtained currency

The aluminium slipper type introduced by Mr. Ricardo.



The Zephyr steel piston. Modifications of this design have been produced both in aluminium and cast iron.

A skeleton piston, the design of which originated in the U.S.A., the "Pondeleck."

The ultra short type of aluminium piston as used on some war aero engines.

The Shortcomings of Motor Cycle Engines.—

not long ago that a certain motor cycle firm was experimenting with a cylinder which was a copy in miniature of the cylinders used on a well-known and eminently satisfactory rotary engine. Now the construction of this cylinder is curious, and is *suitable only for a rotary engine* owing to the fact that, though the cylinder barrel is admirably cooled, the cylinder head relies for its cooling *on the speed with which it passes through the air*, whereas it has been definitely confirmed that for high efficiency engines the temperature of the cylinder barrels is unimportant (within very wide ranges), though it is of the utmost importance that the cylinder head should be kept cool. Instances could be multiplied, but the above is sufficient to show that it is useless to copy promiscuously without a proper knowledge of "the reason why."

Failing the idea of a communal research works, each manufacturer who has the future of the firm and the motor cycling public at heart will have to lay out at some expense a small research department which will very soon repay its initial cost. For, apart from improvements in design and material, it is possible to carry out endurance tests in a week in a properly equipped shop which would take months (and then be inconclusive) if carried out on the road.

Let us turn our thoughts to some of the most blatant faults of the average motor cycle and see what can be done to improve matters.

Reciprocating Parts.

Though strictly speaking valves and tappets come under this heading, valve gear is such an important item that it deserves to be dealt with separately, therefore I intend to include only piston, gudgeon pin, and connecting rod. Compared to aero engine work, the piston of a motor cycle engine is usually a horror to be gazed at with wonder and disgust, and, though bearing surfaces cannot be cut to the same degree that is possible in war aero engine practice, where long life is not of primary importance, a little careful study will show that a great deal of weight can be saved by reasonable design. For instance, I have seen a piston from a 60 mm. bore motor cycle engine, the skirt of which was just double the thickness used in the skirt of an air-cooled aero engine of over 100 mm. bore, and both were made of cast iron.

Aluminium will do much to rectify the weight question, and will also improve piston cooling, but some research will still be needed before the most suitable alloy and satisfactory clearance are decided.

An important departure in connection with piston design has been introduced by Mr. Ricardo with his slipper type piston, which has much to recommend it, as it reduces weight and piston friction to a very large degree, and permits the use of a very much lighter and stiffer gudgeon pin. It has also other advantages with regard to lubrication which need not be discussed at this juncture. There is, however, a point to be watched, in that the contact area between piston and cylinder is so much reduced that the cooling of the piston may be affected on hot-running air-cooled engines. This, however, is a debatable point, and, be it as it may, there is certainly very much unnecessary metal and friction surface in most motor cycle pistons. Narrow, deep piston rings have come much into favour, especially with aluminium pistons, where they are used partly for constructional reasons and partly for the excellent results obtained from this type.

If care be taken to support the gudgeon pin adequately and a suitable steel is used for this part, a considerable amount of weight can be saved by using hollow pins. (Half an ounce is of great importance in reciprocating parts of a high speed engine.)

Connecting Rod Design.

It is, however, when we get to the connecting rod that the most curious growths appear, and, oddly enough, some of the best known firms are the worst offenders in this respect. Large flat lumps of unsuitable steel are used, and in certain particularly vicious cases are fantastically shaped at certain points, the shapes having no relation to the strains imposed.

Even before the war racing car manufacturers were well ahead of motor cycle practice in this respect, and nowadays, with special steel, wonderfully light section rods can be used. A certain car of 88 mm. bore is fitted with tubular rods of 14½in. centres, ¾in. O.D. tube, 1 mm. thick in the wall. Another engine of 100 mm. bore has a connecting rod of 11in. centres of H section, and is only 2 mm. thick in the web; and yet many motor cycle engines of infinitely less power per cylinder are content to stagger around with solid lumps of ⅜in. steel just where an ounce or two saved would make an enormous difference to efficiency, smooth running, and bearing wear. I can almost see the "satisfied owner" rise against me in his wrath while the manufacturer says words to the effect that "your bicycles will cost you more." To the former I would say, "You may be satisfied with the results obtained, but that is no reason why they should not be improved." To the latter, the answer is, "Possibly, but it's worth it."

It is not suggested that the designs need be carried to extremes, except in racing machines; but a study of metallurgy and contemporary design will enable great improvements to be made at little cost.

It should be realised that a few ounces saved in the piston and connecting rod of a high-speed engine will have a very beneficial effect on the wear of bearings, etc., owing to the decreased reciprocating loads.

(To be continued.)

The P. and M. in Mesopotamia The photograph was taken 600 miles up the Tigris by B. J. Hands, who speaks of the splendid work performed by these machines under most trying circumstances and in terrific heat.

A Searching Test of the New 3½ h.p. Mechanically-lubricated Model during the Scottish Six Days' Trials.

IF ever a favourable opportunity existed for trying out a new spring frame machine, it was in the recent Scottish Six Days' Trials, and I doubt whether any British spring frame has been put through a more complete gruelling than the new 3½ h.p. Douglas with which this article deals. The machine was kindly lent for the event by Messrs. Alexander and Co., of Edinburgh, and was Alfred Alexander's property: the identical machine on which he won the speed contest at Lanark the Saturday previous to the trial.

Anyone who has ridden in the classic Highland event knows the nature of the roads traversed: knows, too, the difficulty and hardship of keeping to schedule time over the appalling surfaces, while one has only to glance at the records of the trial to appreciate the fact that it is as much a test of frames as it is of engines and transmissions: in fact, there were this year, and usually are, more retirements from frame breakage than from engine defects. A frame that will stand up to the gruelling our machines were given is undoubtedly a sound proposition, so far as strength and durability are concerned; and, since the only competing spring frame Douglas fell out for reasons in no way reflecting on the machine, it may be as well to set down the exact nature of the test to which my particular mount was put.

The Work to be done.

Up in the morning with the competitors; and if there were a check between the starting point and the first test hill, I usually rode along with the early starters, averaging about 30 m.p.h. to the check, where it was possible to steal a lead of ten minutes or so on the first starter, who had to await his time. This enabled one to scale the precipice, note the most likely spot for failures, and observe the various performances till the last man, who was often very late, had passed. If the hill were tackled in the morning, one was usually able to catch up with the crowd at the lunch control, where all the bits of news are picked up. After lunch one fared the same as the competitors.

The Method Thereof.

In this way, then, the entire route was covered, and every competitor was observed on every non-stop hill. True there was no need to make up time by blinding at considerable personal risk over impossible roads, but the little Douglas was kept hard at it the whole of the time, maintaining an average above the legal limit, covering the actual course in less running time than the competitors were allowed. It made a clean ascent of each of the observed hills, ticked round the hairpins at the merest crawl, and picked up with a roar on the stiffest parts of the gradients.

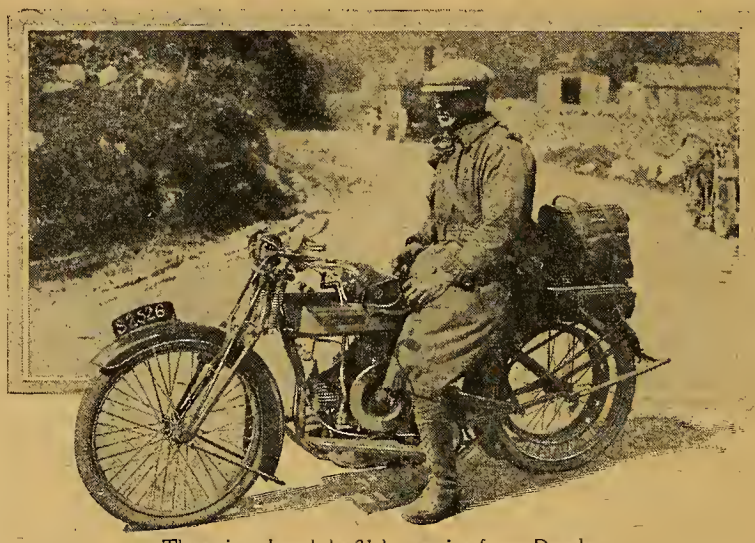
No troubles at all, outside tyre troubles, were experienced, and it goes without saying that only on the very best machine is it possible to keep in such close touch with the competitors. It must be easy to handle, gentle with its rider, capable of terrific revs. and able to accomplish climbing feats sufficient to tax the skill of an antelope—to all of which the new Douglas aspired. The fact that this particular rider is anything but a "crack"—is, in fact, a very average type of jockey who hates personal risk of any kind—reflects further on the merits of the machine: in fact, I believe

A Spring Frame Douglas on the Scottish Hills.—

anyone with an atom of experience in competition riding could have gained a gold on this superb little 'bus.

The Rear Springing.

As regards the springing, never again will this scribe tackle a six days' trial on a rigid frame. The springing of the Douglas saved one from all those fatiguing spine jolts which make the Scottish Six Days, in particular, so tiring an affair for most of the performers. On several occasions the competitors complained of the roughness of the roads, and were seen holding their backs when evening came, and I do not recall having ridden in any strenuous trial without experiencing spinal fatigue. In this event, however, the Douglas simply glided over the pot-holes, and many times the only thing that drew attention to the roughness of the surface was the clanking of the front forks.



The writer aboard the 3½ h.p. spring frame Douglas.

Saddle soreness was certainly experienced after the fourth day, as the machine was fitted with a miniature stiff-spring saddle of the racing type, affording about as much comfort as the top of an Applecross pinnacle. Had the frame been rigid, the discomfort would have been awful, and I should have retired after Amulree. My experience of spring frames is that even a machine so fitted requires every bit as efficient a saddle as does a rigid frame, and for this reason: The springing must be stiff, otherwise the machine floats and is an impossible proposition on hairpins. All that is required of the frame springing is to absorb the shocks, and road vibration, therefore, must be absorbed by the saddle. Since the saddle is spared all spring-breaking jolts, it can advantageously be fitted with even lighter springs than usual.

A Practical Rider's Requirements.

In my opinion, a spring frame that is floating the whole time is a mistake for a solo 'bus. It upsets the steering where such delicacy is required as in the Scottish Six Days. A good present-day saddle is perfectly capable of absorbing road vibration; where it falls short is in absorbing the big jumps. Therefore, let the springing be set as it is in the Douglas, the machine riding like a rigid frame until such jolts are encountered as are beyond the shock absorbing capabilities of the saddle, and which the frame automatically takes up. Even then it will be found that the frame springs are seldom idle for more than a few seconds, and that the worst array of pot-holes is passed unnoticed.

At the end of the trial I tested the rear wheel for rigidity in every direction. There was no suggestion of play anywhere, and Alexander tells me that for weeks past he has been using this machine for running in and out from business—between thirty and forty miles per day—with a sidecar and pillion passenger. One day I carried a petrol tin tied on with a bit of string; it never moved from its moorings, and even the shaving soap in the bag on the carrier retained its original rotundity of shape.

Steering.

My particular style of wobbling round corners never did suit the Douglas, and perhaps the fact that I am accustomed to a Scott accounts for my clumsiness with other mounts. It must be admitted that I have ridden machines easier to steer than the new Douglas, but it is probably well up to the average. The 4 h.p. Douglas riders did not seem to experience much difficulty with their corners, and the 3½ h.p. is certainly easier to steer than the 4 h.p.—though less easy to steer than a Scott.

The engine is an absolute gem. It hummed away like a little dynamo, and seemed to improve as the days passed—no vibration, no noise, just a faint hissing purr, which changed to a deep roar when the throttle was yanked open. Some tremendous averages were put up over long distances and bad roads with perfect ease and comfort—in fact, I have never ridden a machine in which time could be made up with such absolute effortlessness. One merely opened the throttle a shade and was floated along till the crowd hove in view. It is faster than the 4 h.p., though perhaps a shade less powerful.

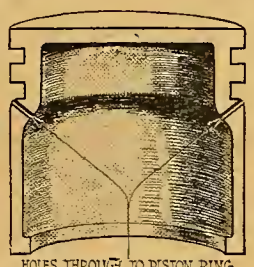
The Lubrication System.

The mechanical oiling system is foolproof. One merely needs to set the drip and leave it there. The hand pump can be resorted to if desired, but it never seemed necessary, and the engine ran the whole time with that silken smoothness that indicates perfect lubrication. The only improvement one might suggest is that the hand pump be entirely separate from the mechanical system, so that it is not necessary to reset the drip after using the hand feed. The engine required an absolute minimum of oil, and, in spite of the atrocious conditions, petrol consumption usually averaged out at about 55 m.p.g.

On the last day of the trial the engine was flooded with oil to see what would happen, as Alexander claimed that it was impossible to "oil her up." Oil streamed from the overflow ere the exhaust became blue, and the plugs remained dry. This is due to the

A Spring Frame Douglas on the Scottish Hills.—

arrangement of the lower piston ring, which acts as a scraper, preventing oil reaching the cylinder head, as shown in the sketch. The oil banks up behind the bottom ring, and is returned to the inside of the piston by way of the small holes provided for that purpose. Thus one is given latitude on either side for error in oiling, and when once the crank case is charged the engine will run perfectly for twenty or thirty miles without drying up.



Section of 3½ h.p. Douglas, piston showing holes for return of surplus oil from cylinder walls.

A Criticism.

The spring frame Douglas is a distinctly fast mount, and this is perhaps why the unsuitability of the present position of the brake pedal is brought home with such stunning force. It is tucked under the carburetter forward of the right footboard, and if it were under the tank it could not enjoy greater immunity from the foot of the rider. I was annoyed with that brake to the end. One simply had to grope blindly for it, curling one's right leg into serpentine attitudes, and when wanted in a hurry it was never there. Also, in wet weather, when eventually found, it was apt to jam the rear wheel when applied unless the block was kept greased, which was bad for the belt.

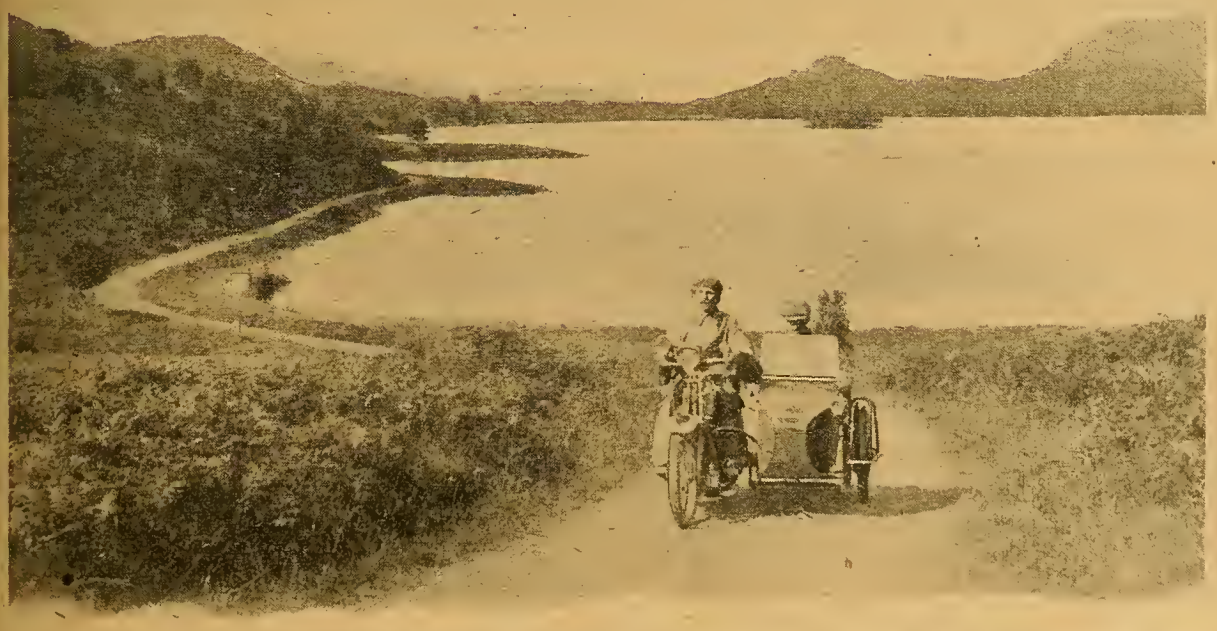
This is the only point I would criticise in a perfectly delightful machine. The brake of the 4 h.p. Douglas occupies a proper position accessible to the heel of the rider. The kick starter of the 3½ h.p. gets in the way on the right-hand side, but there is no reason why the brake should not be carried to the left side, occupying the same relative position.

It is sincerely to be hoped that next year this model will be available to the public by the score. This is no journalistic puff, and I candidly admit that it was fully intended to break Alexander's springs during the event, then point out the weakness which he claimed not to exist. But there was no breaking anything, for we floated through the trial from beginning to end—the very best 'bus for the job one could wish for! The hand clutch is delightful, and the new model will fill the bill for practically every rider, from the elderly potterer in search of maximum comfort and docility to the speed merchant who wants something that will hold the road and "rev." like nothing he has ever tried before.

Tyres and Transmission.

As regards belt and tyre wear, this trial can be set down as equivalent to at least 2,500 miles ordinary touring, yet the Hutchinson studded tyres of the Douglas still carried perfect treads at the end of the event, the front tyre being imperceptibly worn, while the back had only two slight scratches. Aultnaharie stretched the belt, which had to be taken up, but some of the chain-driven machines experienced continual transmission breakages.

Finally, let me say that on previous strenuous trials, when a strange machine has been picked up at the eleventh hour, I have vowed every time never to do so again. One's own mount is the best for long rides, but this time the eleventh hour choice far surpassed anything previously tried. After all, what can anyone desire more than a properly insulated seat and an engine which "revs." gigantically or pulls as well at 50 m.p.h. as at 10 m.p.h.? Moreover, the new Douglas is foolproof. It seems automatic, asking practically nothing of the rider. CHINOOK.

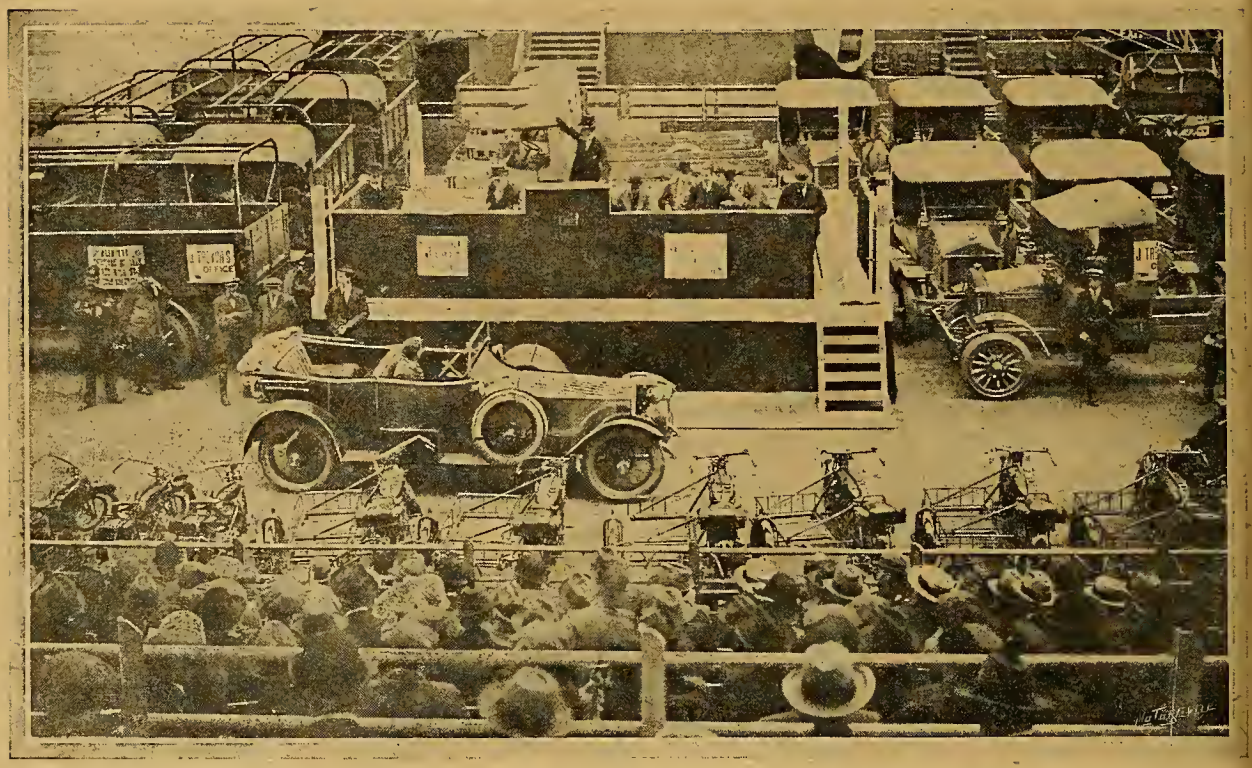


The course of the Scottish Six Days is through some of the most magnificent scenery in Great Britain, although rarely can the entrants appreciate it to the full, being too engrossed in piloting the machine over the "roads." The above photograph, taken near Glendoe, conveys a slight idea of the beauty of the route.

B7

AUCTION SALE AT OLYMPIA.

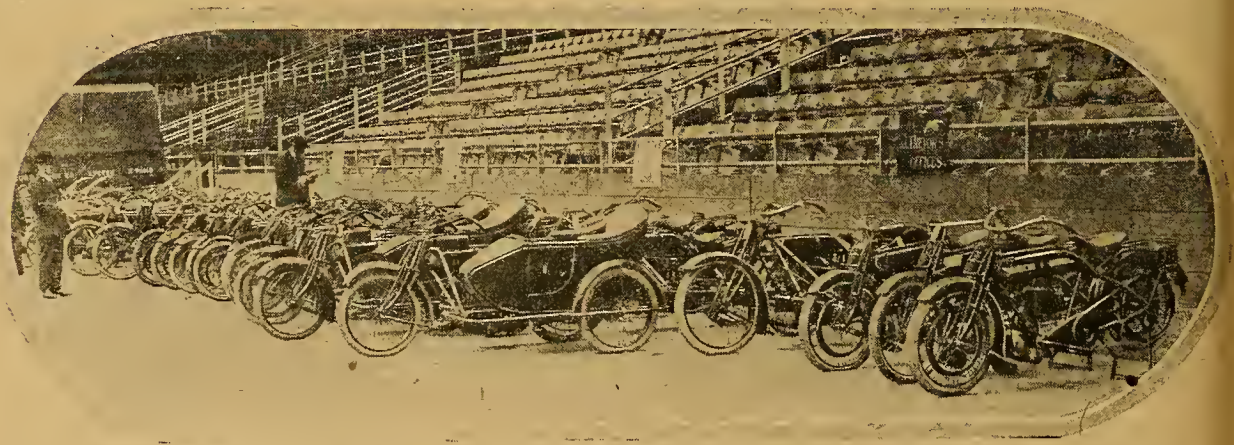
B.S.A.'s, Clynos, Rudges, and Sunbeams Realise Good Prices.



Several Rolls-Royce cars were driven up to the rostrum at the first Government auction sale at Olympia. A similar demonstration of the "running order" of motor cycles no doubt would have been appreciated by the bidders for machines.

THE first Government auction sale at Olympia took place under the auspices of the Surplus Government Property Disposal Board on Tuesday, July 29th, the auctioneer being Mr. J. Trevor, F.A.I. Than Olympia, no building is better suited for this purpose, since the tiers of seats rightly belonging to the tournament are still there, the auctioneer's rostrum being placed conveniently in the centre of the arena. A large crowd assembled early, and waited patiently to obtain motor cycles while thousands of guineas changed hands for lorries and cars. The machines, for the most part B.S.A., Rudge, or Clyno, were badly painted, it is true, but were apparently in good order and certainly complete. Some had coloured tanks, some were all black, and some preserved still the Government green. To several of the Clynos an ammunition carrier sidecar was fitted; one B.S.A. still had a carrier cushion seat, and several appeared to have been fitted with new cylinders. There were very few sidecars, and those present were not in good order, as one would expect after hard Service usage.

So far as prices are concerned, the following are the highest and lowest figures obtained during the sale by the various makes offered: B.S.A., lowest price 50 gns., highest price 60 gns. average price 55 gns.; Sunbeam, lowest price 50 gns., highest price 77½ gns. average price 55 gns.; Clyno, lowest price 107½ gns., highest price 115 gns., average price 110 gns.; Rudge, prices ranged from 50 gns. to 55 gns.



A few of the Clynos and B.S.A.'s that were sold at very good prices. Although the bidding was good, buyers showed more caution than they did at sales four or five months ago.

Eight Hundred Miles Trial in Italy.

A trial run from Genoa to Trento and Trieste, over a course of 800 miles, was recently organised by the Genoa Army Command, and was open only to men who had served in the Italian Army. Sixty-six competitors participated.

Sidecars as Taxis.

Recently the Edinburgh magistrates had before them the question of licensing motor cycles and sidecars under the Hackney Carriage Acts, and decided that these were not suitable subjects for such licences. We should like to know the grounds upon which this decision was made.

The Tanks Journal.

One of the best and largest service papers we have seen is *The Tank Corps Journal*, published monthly by the Tank Corps Training Centre, Wool. As its title suggests, the organ is devoted to those who make and man the tanks, and it is the official organ of the Tanks Association. The contents are of a more serious nature than the majority of semi-service papers, and it includes as a serial a short history of Tanks in the Great War issued by the War Office. The subscription is 5s. per annum post free, or 3d. per copy, 4½d. by post.

A Brain Wave.

One of our readers hit upon the brilliant idea of removing the long tappet rod from the overhead inlet valve mechanism of his 3½ h.p. Rudge-Multi with the object of preventing a motor cycle thief from driving away the machine.

Having had an exceedingly good tea, and being of a forgetful disposition, he drove the machine straight away home. After having discovered what he had done, he forthwith penned a letter to the Editor, asking how it was that the machine had arrived at its destination without any visible means of operating inlet valve. Had our friend been as long acquainted with motor cycles as ourselves, and been a motor cyclist in the days when automatic inlet valves were the rule and mechanical valves the exception, the letter referred to would not have been written.

Life Membership of the A.A.

The rules of the Automobile Association limit the number of life members. That limit has now been reached, but it has been decided to accept 1,000 additional A.A. life memberships at an increased compounded subscription of twenty guineas.

Stolen Machine.

Five pounds reward is offered by Mr. E. R. Gibbons, 102, Disraeli Road, Putney, S.W.15, for information leading to the recovery of his 2¾ h.p. three-speed Douglas, registered No. PA 2684, engine No. 20974, frame No. 20671. The machine was stolen on the 25th of July.

Special Motoring Facilities for the Army of Occupation.

In view of the recent Order whereby officers in France, Belgium, and the Rhine Army of Occupation are permitted to have their motor cars and motor cycles for their own use, the Automobile Association has placed the services of its Foreign Touring Department at the disposal of all officers serving in these countries.

The Association offers to supply international passes, which entitle the holder to drive his car in practically any country of Europe, and triptyques to pass cars and motor cycles through the Customs of France and Belgium on the same terms on which these papers are supplied to its members. This means that, instead of depositing the amount of duty with the Association or with the foreign Customs, the officer need only give the Association a banker's undertaking to indemnify it against any loss it may incur through his failure to comply with the Customs regulations of foreign countries.

The A.A. Touring Department will also make all the necessary shipping arrangements.

Special Features.

SHORTCOMINGS OF MOTOR CYCLE ENGINES.

IMPRESSIONS OF THE SCOTTISH SIX DAYS.

FROM WAR TO PEACE.

The Setting of Plug Points.

A reader sends us a cutting from the motor and cycle column of the *North Star*, in which we find the following:

"The reason for this particular case of misfiring was that the points were too far apart. The correct width of the gap should be about *the width of a postcard.*" (Italics are ours.)

THE FAMILY SIDECAR.

A well-designed sidecar, very distinctly of the "family" variety, was seen at the Stile Cop hill-climb on Peace Day. Apparently each of the five people on the outfit are accommodated in tolerable comfort. The machine is a Williamson 8 h.p. horizontal twin, and certainly for such a load no smaller power would be satisfactory.

Motor Cycles, Ltd.

A PROSPECTUS, inviting the public to subscribe for shares in the above company recently appeared in several London and provincial papers. We feel it our duty to point out that, as we were unable to approve of the business methods of Messrs. Rider Troward and Co., Ltd., whose business, Motor-Cycles, Ltd., is acquiring, we recently found it necessary to refuse the advertisements of that company. The prospectus in question was, presumably on that account, not offered to *The Motor Cycle*, but, had it been so offered, it would not have been accepted by this journal. The highly speculative nature of the investment, to use a mild expression, is apparent from the prospectus. No certificate is given showing the tangible assets to be acquired by the new company, and the only profit figures given show the gross profits derived from the first four months of trading in each of the last four years. If the remaining portion of each year was as favourable as the first four months, it is difficult to understand the object of withholding the total gross profits of each year.

Then again, the profits shown are gross profits only. The term gross profits is one which has no exact meaning, and it may refer in this instance to the difference between the cost of the machines purchased and the amount for which they were sold, in which case there would be a charge against the gross profits of the whole of the expenses of working the business, which might quite easily be greater than the amount of the gross profits disclosed.

Mr. Eric Rider Troward, who is apparently responsible for the company, states that it is estimated that during the first year of the incorporation of the new company, at least 5,000 new motor bicycles and lights cars will be disposed of, at a profit of £75,000. There is no apparent reason why he did not make the figure £750,000. Indeed, Mr. Troward says that the only limit to the profits of the company is the difficulty of obtaining machines fast enough from the makers, and in order to alleviate any anxiety upon that point he stated that he has placed orders for over 4,000 machines, which have been "accepted by the manufacturers."

Mr. Ronald C. Power, the chairman of the new company, is, it is stated, managing director of the British and General Aviation Co., Ltd.

Scottish Six Days' Trial.

The official results are as follows:

FIRST CLASS AWARDS.

J. W. Wills (5-6 Rover)
N. Black (4 Triumph)
J. A. Newman (3½ Sunbeam)
D. Westwood (4 Triumph)
H. E. Fairley (4¼ B.S.A.)
V. Olsson (4 Douglas)
E. W. Choldcroft (4 A.J.S.)
Capt. Hay-Will (6 A.J.S. sc.)
G. Grinton (7-9 Harley-Davidson)
R. B. Clark (4 Douglas)
H. G. Cassie (4 Douglas)
A. F. Downie (6 A.J.S. sc.)
A. L. Downie (2¾ A.J.S.)
W. Strettell-Miller (3½ P and M.)
D. M. Brash (7-9 Harley-Davidson)

SPECIAL AWARD.

A. F. Downie (6 A.J.S. sc.)

SECOND CLASS AWARDS.

D. S. Milne (4¼ B.S.A.)
A. H. Alexander (4 Douglas sc.)
J. Beck (3½ Sunbeam)
J. A. Jeffreys (6 A.J.S.)
G. C. Stead (A.C. light car)
B. Alan Hill (8 Morgan)
A. Downie (5-6 Ariel)
Mrs. Bell (6 A.J.S. sc.)
Duncan Bell (5-6 James sc.)

THIRD CLASS AWARDS

Claude Duncan (4 Douglas)
D. S. Alexander (8 Enfield sc.)
E. J. Tunbridge (5-6 A.J.S. sc.)

Coventry and Warwickshire Hill-climb.

This year the Coventry and Warwickshire Club's hill-climb, which, before the war, was one of the classic events, may be for members only. Provided suitable arrangements can be made regarding the hill, the event will take place on August 23rd. Applications for membership to the club should be made to the hon. secretary, Capt. M. Sampson, 19, Hertford Street, Coventry. As in the case of several other clubs, the latest decision of the Manufacturers' Union regarding competitions may cause the Coventry club to make the event an open one.

Miss Hough (A.B.C. Skootamota), who, in the North Birmingham A.C. Trial, won the premier award, the Bayliss trophy, also gained gold medal and special award for best fixed gear performance.

Important Appointment.

We have pleasure in announcing the appointment of Major H. R. Watling as general manager of the Cycle and Motor Cycle Manufacturers' and Traders' Union. Major Watling is succeeding Mr. Alf. Bednell, who has so capably filled the position since the formation of the Union in 1910, but who is now retiring from active connection with the management.

A Stolen Motor Cycle.

Last week a new 6 h.p. standard Zenith motor bicycle (no clutch and kick-starter) disappeared from the Zenith Co.'s works. The machine had red panels on the tank and red lining to the mudguards, which is contrary to Messrs. Zenith Motors' usual practice of grey panels and lining. The frame number is stamped on the head lug just above the crown race, and is 5253, and the engine number is 65697.

Obstructing the Police.

In the paragraph which appeared on page 91 of the issue of the 24th ult., dealing with a case of alleged obstruction at Enfield, it was stated that the motor cyclist was defended by the A.A. solicitor We are asked to state that he was defended by Mr. G. D. Dean, who is solicitor to the Royal Automobile Club, and the Auto-Cycle Union.

The Circuit de l'Eure.

The Circuit de l'Eure will be held near Vernon on August 16th and 17th. The weighing and sealing of the competing machines will take place on the 15th inst. at Vernon. On the first day of the race, sidecars and cycle cars only will run, while on the 17th inst. the motor cycle events will take place. Among the entrants we notice an Indian and a Morgan, to be driven by Darmont, formerly a Zenith rider in France. On the occasion of the last Circuit de l'Eure, a good many English competitors took part. Entries should be sent to The Moto-Cycle Club de France, 94, Boulevard Richard Lenoir Paris.

Trade Support of Trials.

An important decision was made last week by the Motor Cycle Section of the Manufacturers' Union concerning trade support of competitions. The resolution responsible for the withdrawal of competitors in the Scottish Six Days' and other events has been rescinded, and the members have now agreed to support twelve events between August 1st and November 30th. Ten of these competitions have been decided, and the remaining two will be settled during the next few days. No doubt this decision will effect several club announcements referred to in this issue The ten events selected are as follow:

Aug. 16.—North Birmingham M.C.C. Open Reliability Trial
Aug. 23.—Birmingham M.C.C. Open Hill-climb.
Aug. 23.—Redditch and D. M.C.C. Open Reliability Trial.
Aug. 30.—Bristol M.C. Open Speed Trials at Weston super-Mare.
Sept. 6.—York and Dis. M.C. Open Hill-climb
Sept. 15-20.—A.C.U. Six Days' Trial.
Sept. 27.—Wolverhampton Open Hill-climb.
Date not yet arranged.—Sutton Coldfield Reliability Trial (Caithorpe Cup).
Date not yet arranged.—Liverpool, Birmingham, and London 24 Hour Open Reliability Trial.
Date not yet arranged.—Coventry Hill-climb.

A SEARCHING MAGNETO TEST.

Engines Running in Two Feet of Water. "Shower-proofness" Demonstrated.

ON Thursday last a very interesting demonstration was given of the waterproof qualities of the E.I.C. magneto by a number of B.S.A. testers, these machines being now equipped with this make of magneto as a standard fitment.

In the first place, the idea of driving and "stunting" in a deep watersplash was quite unofficially conceived by the testers for their own sport, and coming to the ears of Mr. Bryan, the B.S.A. publicity manager, he at once suggested to the makers of the E.I.C. magneto that a special display of this nature would be a very thorough demonstration of the immunity of the machines from ignition troubles due to moisture, even moisture in excess.

B.S.A. testers in the watersplash. No magneto trouble was experienced after about an hour's thorough testing.

A Thorough Testing.

Mr. W. T. Turner, managing director of E.I.C. Magnetos, Ltd., was even a little doubtful of the success of the experiment, the company never having claimed more than the ordinary degree of shower-proofness for their instruments. However, at his invitation, several interested members of the firms concerned, together with representatives of the press, foregathered in Redditch at the B.S.A. works.

After lunch, under glorious weather conditions, the party were led to the chosen watersplash by a group of testers mounted on standard B.S.A. machines, which were subsequently driven through at depths varying from a few inches up to 2ft.

The machines were also driven up and down a steep bank in and out of the water, and pillion passengers were also taken; several stops and restarts were made in the water, and one machine, with no part of the engine unit out of the water except the cylinder and carburetter, was kept running for two minutes until it stopped from back pressure set up by exhausting under water. On being wheeled to the bank after one or two preliminary kicks to eject the water which spouted from the silencer and crank case release in great quantities it started up without difficulty. Indeed, none of the machines were put out of action, despite the fact that no special preparations were made, other than in one or two cases only, a coating of grease had been applied to the carbon brush holder.

For an hour the machines were splashing their way through the water, and at the end of that time they were all running perfectly and no misfiring was evident.

Any magneto manufacturer might well be proud of this demonstration of waterproofness. After all, the test was in every way more searching than would be found in ordinary riding conditions.

Running a machine with the magneto totally submerged

For Motor Cycles Only.

E.I.C. Magnetos, Ltd., are indeed to be congratulated, and their specialisation on motor cycle types is meeting with great success, the following firms having already commenced to fit this make, so we are informed: B.S.A., P. and M., Levis, Douglas, Allon, Rover, Sunbeam, and Morgan.

Referring to the flat twin magnetos, we were informed that much greater accuracy in the angle of the cams is required than in the V twin machine, and in the case of the magnetos made for the Douglas engine, certain of the dimensions are worked to a finer limit than even A.I.D. requirements demand.

We were satisfied that the makers are using every endeavour to place the E.I.C. magneto in the front rank.

Road Locomotion.

The average boy loves to imitate any new form of road locomotion, and adopts ingenious methods. The other day we saw a youth mounted on a pair of roller skates, balancing on his feet a large suit case, the motive power being provided by another boy, who pushed behind. Apparently the idea was to imitate a scooter.

M.C.C. Team Trial for "The Motor Cycle" Cup.

Rules and Regulations for the Club Championship Event on Saturday, Sept. 6th.

THE twelfth M.C.C. Team Trial will be held at a place within easy access of London on Saturday, September 6th. Already promises of entries have been received from several important motor cycle clubs. The competition is run for *The Motor Cycle* challenge cup, which, up to 1914, was competed for annually since 1904 by teams of six riders. This year three will drive solo motor bicycles and three passenger machines.

The M.C.C. presents a gold medal to each rider of the winning team, and a silver medal to the winners of the teams making a full score. The following is a list of the clubs which have held the trophy :

1904. Coventry M.C.C.
1905. Motor Cycling Club (walk-over).
1906. Motor Cycling Club.
1907. Coventry M.C.
1908 Coventry M.C. (who won the old trophy outright).
1909. Motor Cycling Club.
1910. Coventry and Warwickshire M.C.
1911. Derby and District M.C.C.
1912. Nottingham and District M.C.C.
1913. Sheffield and Hallamshire Club.
1914. Motor Cycling Club.

The following are the conditions for this year's trial which, as hitherto, will be run under the competition rules of the A.C.U.

1. This cup is a challenge trophy, entitled *The Motor Cycle* Challenge Cup, of which the Motor Cycling Club is trustee and administrator.

2. It is to be awarded in a competition between teams of riders, members of and nominated by recognised automobile and motor cycling clubs. In case of doubt as to whether any entrant is or is not a recognised club the Motor Cycling Club shall adjudicate. No club may enter more than one team.

3. If the cup be won three times, not necessarily in succession, by the team representing any one club, it shall become the absolute property of that club.

4. Each team shall consist of six riders, three of whom shall drive solo and three passenger machines, such as tricar, side-car, or three-wheeled cycle car. A passenger must be carried. The joint weight of passenger and driver shall not be less than 20 stone. Passengers for the passenger machines must be provided by the entrants. A passenger shall not leave his or her seat during any part of the competition, excepting at the tea halt, and shall not assist the driver in any way whatsoever. Pedalling or assisting with the feet for the purpose of propulsion shall count as a stop. To qualify for starting each team shall provide an additional rider (and machine) to act as an observer, who shall be at the disposal of the Motor Cycling Club during the progress of the competition. Lady drivers will not be permitted.

5. The competition shall consist of a non-stop course to be covered three times. Total distance, 100 miles.

6. A competitor covering each of the three circuits at 20 m.p.h. will gain the maximum number of marks.

7. Sufficient fuel and oil must be carried for the whole of the trial. Competitors may replenish from a metal receptacle carried by them, provided such replenishment is effected by the driver while the machine is in motion. Such fuel or oil must be carried from the start and not taken up after starting.

8. The number of miles accomplished by each rider of each team without stoppage, other than stoppages due to exigencies of traffic, will be added together, and the team scoring the highest mileage thus arrived at shall be the winner, but in the event of more than one team making a

The Motor Cycle Fifty Guinea Challenge Cup.

full score in mileage the award will be given to the team making the best performance in the consistent driving test. Unavoidable stoppages due to traffic must be reported, but will not count against the rider. No adjustments are permissible during any such stop.

9. A consistent driving test will be held on a hill, which will be ascended on each circuit during the trial. It will be divided into two sections, of which the first part must be climbed at an average speed of not more than 10 m.p.h., and the second part at an average speed of not less than 15 m.p.h. The times taken by a competitor will be noted on two occasions, and the team of riders who most closely repeat their performance of the first ascent on the second occasion will be adjudged to be the winners, in the event of more than one team making a non-stop run.

10. Competitors must carry two numbers, and those who complete the course, after filling in details of their performances, such as non-stop or the number of stops and their cause, must hand these numbers to the captains of their teams. The captains or their deputies shall place them in the order of the programme, and hand them in at headquarters within half an hour of the completion of the competition.

11. The competition will start at 1 p.m.

12 The entry fee shall be two guineas per team up to the first post August 23rd, when the entries close.

13. Clubs must send the special entry form duly filled in, together with the entrance fee, to Mr. Southcomb May, 34, Gower Place, London, W.C.1.

14. The judges shall be three in number, one nominated by the donors, one by the Motor Cycling Club, and one by the Auto Cycle Union. The judges' decision shall be absolute, and without appeal.

15. The Motor Cycling Club reserve the right to refuse any entry.

16. Any organised assistance will disqualify the whole team.

17. Should it be deemed advisable, in the interests of the competition, these regulations may be revised or added to by the Motor Cycling Club.

18. The Motor Cycling Club shall not be held liable for any damages, caused accidentally or otherwise, to the competitors' machines whilst in charge of the officials of the club.

The following clubs are likely entrants for the M.C.C. Inter-team Trial for *The Motor Cycle* challenge cup : The Motor Cycling Club, the Ealing and District M.C.C., the Essex Motor Club, the Middlesex M.C.C., the Nottingham and District M.C.C., the Woolwich, Plumstead, and District M.C.C., the Birmingham M.C.C., the Coventry and Warwickshire Motor Club, and the Public Schools M.C.C.

Club secretaries are invited to bring the trial to the notice of their committees with a view to selecting a team to represent them in this club championship event.

BIRMINGHAM M.C.C.

The open hill-climb arranged for August 23rd has been cancelled, and a club event will be held in its stead. In order to cater for sporting amateurs who are not members of the club, it has been decided that they may become members of the club for the current year on payment of entry fee of 5s. and a reduced subscription of 3s. 6d. Entries should be addressed to the hon. sec., Mr. W. H. Egginton, 76, Earlsbury Gardens, Birchfields, Birmingham.

IMPRESSIONS of the SCOTTISH SIX DAYS

An old Competition Rider's Experiences on a Morgan

HAVING been passed as "unfit for further service" by the medical board, and sent off on "indefinite leave pending discharge," something had to be done to make the most of the leave. With pleasant recollections of glorious times spent during four previous Scottish trials, I decided that the 1919 Scottish Six Days was the very holiday I needed. Accordingly, at the last minute almost, I entered my long-waited-for G.P. Morgan, and hoped that the delayed delivery would materialise in time for me to reach Edinburgh for the start. It was Thursday prior to the start of the trial before I succeeded in getting time to visit the Morgan works at Malvern, where, to my great delight, I found the machine finished with the exception of a few details. After a short run round Malvern, including the ascent of the Old Wyche and the notorious Beacon Hill, I left on the run North. My wife, who had decided to come as my passenger, met me at Birmingham, and on Friday morning the real journey to the Northern capital was started in earnest. It was a quite uneventful and very pleasant run, the roads for the most part being in wonderfully good condition. We put up for Friday night at Penrith. The little car had run throughout the day in a delightful manner, showing a considerable turn of speed, and its ascent of Shap on top gear augured well for the future.

On filling up for the second stage of the journey, I was pleasantly surprised to find that we had been averaging nearly 60 m.p.g. During the trial this mileage dropped to 50 m.p.g. average for the week, which was not surprising in view of the condition of the roads, the length of the hills, and the high speed which it was necessary to maintain practically the whole time in order to average 20 m.p.h. and adhere to schedule time.

For the second stage of the run, I decided to proceed *via* Moffat and the "Devil's Beef Tub," this route being to my knowledge in good order, very pretty, and also able to provide me with some idea of the car's capabilities on long pulls. At Carlisle I had to enquire the way, and, when asking for Gretna Green, the genial policeman smiled as he directed us. Whether or not he thought the Morgan, with its pile of bags, etc., on the carrier was the modern equipage for flights to the historic blacksmith's shop, I cannot say; anyhow, he was most courteous, and his brogue indicated that we were fast nearing the border.

We arrived at Edinburgh in time to get thoroughly mixed up in the wild "Peace Day" celebrations, which at the time of our arrival had developed into a violent firework bombardment in the streets. Having arrived at our hotel, with no worse injuries than one torn stocking, a scratched shin, and a bruised ankle, we decided to continue our admiration of the firework display from the upper windows.

Sunday morning found us at Croall's garage making our final adjustments, fixing number-plates, filling in numerous forms as to starting condition, etc.

It was a most pleasant day, for as the time went on and other competitors began to report, the meeting of old friends and rivals of many a pre-war trial passed the time rapidly away. With the arrival of the others came very disquieting rumours of the condition of the route, roads which were never noted for their excellent surface were now reduced to the like of nothing on

earth by the haulage of timber. Perusal of the official programme did not improve one's spirits, especially when one was looking forward to a nice quiet tour! for, instead of the allowance of ten minutes either side of mean time and a further allowance of five minutes for passenger machines which had rendered previous Scottish trials so peaceful for the man with a machine which gave no real trouble, four minutes only early or late was the total allowed for error this year; also the programme indicated that checks would be placed every twenty miles or thereabouts. In the old days every fifty miles was nearer the mark, and so from the very start it was easy to see that this was to be no "joy ride" even for a solo rider, and that if any passenger machine got through and qualified for a first class award, its performance would be one of which to be truly proud.

Monday morning's ride from Edinburgh to Crieff over excellent roads dispelled to a great extent the qualms caused by Sunday's rumours. Lunch at Crieff at 4s. per head was an indication which was afterwards proved that another attraction of pre-war Scottish trials was likely to be missing this year, *i.e.*, the excellent, well-served and comprehensive meals at a low cost. The first twenty miles after lunch through the delightful scenery of the Sma' Glen lost some of its charm owing to the near approach of the first non-stop observed hill—Amulree.

Amulree.

Although I have ascended this hill on six occasions, once in the A.C.U. End-to-end trial and five times in Scottish trials—and on each occasion made a clean ascent, my mounts having two, three, and four wheels, my respect for this hill in no way decreases. This year it was undoubtedly in its best form to ensure the loss of "golds." Loose stones, boulders, and grass, with a moist surface all combined to make the really severe gradient and acute hairpins even worse than they were. However, determined not to be outed on the first day, we went at it with grim determination; as the hairpins loomed in view we clenched our teeth, shut our eyes (I think), opened the throttle wide, gave the steering wheel two violent wrenches in alternate directions, and as someone in the little knot of spectators shouted, "Well done, Air Force," I realised we had succeeded in negotiating the corners—the only really fatal part of the ascent—and the little 'bus made light work of the remainder of the climb. We even had to wait outside the check at the top, as I was more than my four minutes ahead of schedule.

Rain was falling quite heavily now, and the descent of Kenmore and the covering of the succeeding ten miles to the Aberfeldy check was an absolute nightmare owing to the terrible road surface, which hurled the poor little Morgan about like a cork on a rough sea. At the night control at Perth it was seen that the first day's run—an easy one in comparison with some to come, had claimed not a few victims—at any rate, so far as first-class awards were concerned.

The Devil's Elbow.

Tuesday's run from Perth to Inverness *via* the Devil's Elbow, Braemar, Tomintoul, to Inverness, over the highest road in Great Britain, I believe, was undoubtedly the stiffest day's run; and the weird blinding which had to be indulged in to keep anywhere near schedule time was simply appalling. Undoubtedly this section, with its awful surface, was the prime cause of a good many of the broken frames and sidecar chassis. Rain had made Corgaff, or Cockbridge Ladder, the second non-stop test hill of the day, slimy to the last degree. We were among the first competitors to ascend, and we roared up over the loose slimy surface hurling the stones and earth in every direction, leaving deep, slimy ruts behind us. I was not surprised to hear that numerous failures were recorded among the later arrivals.

The Grand Prix Morgan going well on Aultnaharie.

It was curious to note that at the foot of this hill competitors were directed round an acute hairpin, while a disused road with a grass-grown surface led straight up the hill. This was the cause of an amusing incident and the filling in of a green protest form at the end of the day. Brady, the rider of a Douglas, resides at the foot of the hill. He knew it like the palm of his hand, and with great confidence took it at speed, in spite of the surface. It appears that, instead of taking the bottom hairpin, he rode straight up the steep grass bank at the bottom, and so direct on to the hill, and at the end of the day's run was much surprised to see that he had lost marks on his pet hill. When told of his error in failing to take the hairpin, he was surprised, as it appears that when a boy he had actually assisted in making the road round the bend, as the direct road was too severe for the horses. He naturally concluded the officials would not choose the easier route.

Impressions of the Scottish Six Days.—

This trial is the first long trial my wife has been through, and this second day's run finally decided her that all of us who rode through the Scottish trials and enjoyed it must be mad, and that this was her last trial. I must say at the time I was inclined to agree with her, but now we are safely back home and look back on the incidents and scenery I am, and my wife is, inclined to look forward to next year's event with as much relish as before.

Aultnaharie.

The third day was only exciting, so far as I am personally concerned, owing to the now famous Aultnaharie hill. We were introduced to this acclivity by easy stages, first by descending it with the full knowledge that if we failed to reclimb it our fate was to remain there for ever or until some kindly steamer or ferry or something chose to remove us. However, in spite of the fact that this hill was the cause of my first lost marks, in company with thirteen or fourteen others I was much disappointed in the hill as a whole. The only really difficult part being the first twenty yards or so, in which distance the road climbed some thirty or forty feet and turned two right-angle bends, the road (I beg its pardon, I mean river bed !) was only about eight feet wide with a high bank on one side and a sheer drop to the beach on the other, and the surface consisted of huge boulders. The way in which we slithered rapidly down this portion with locked wheel had caused us to have great respect for the surface and gradient of this last piece. The one and a half hours' wait in drizzling rain, during which time we all walked up the hill and made mental notes on the best course to steer, did not do anyone any good, and I must admit that by the time it came to make a start the majority of us had keen "wind up."

My first difficulty was to get away at the foot, the non-stop section commencing within five yards of the starting point. It was wet grass, and my wheel flew merrily round for some seconds before I even moved an inch. I then covered the distance to the first corner with much wheel slip, and here the front wheel rested against a substantial boulder, leaving the back wheel nothing to do but spin wildly. After some heaving, with the assistance of several spectators we got the wheels on to a reasonable track, and made a restart. We sailed to the top in excellent style, the gradient past the bends being more or less easy. The knowledge that our "gold" had at last slipped beyond our grasp did not give me such regrets as it might, as I was in most excellent company, for, as was only to be expected, the great majority of passenger machines failed at this point, and, in my opinion, it was almost miraculous that any two-track machines were able to overcome the boulders on the lower stretches at all. Running to schedule was not such a difficult matter as on previous days, as the roads, though only tracks, had quite decent surface.

Applecross.

The *pièce de résistance* of the fourth day's run was the ascent of Applecross, or, to be more correct, Tornapress, as it was this side of the hill which had to be climbed non-stop. The run out was over good surfaces for the most part, with the exception of one stretch near Auchnashellach of about five miles, where the road had been torn to pieces through timber hauling.

In the early part of the day's run there was no difficulty in finding the way, for, apart from the excellent arrowing, the route was strewn with dead livestock, apparently the unfortunate victims of the earlier members. The list included a rabbit, bird, chicken, and, finally, a black cat. Speculation was rife as to which of the various unfortunates in that day's casualty list was the culprit of this deed of ill-omen.

Compared to previous years it seemed to me that Applecross was in better condition, and it was quite a significant fact that this dreaded hill only accounted for two failures, and one of these was due to a stone fouling between the wheel and mudguard. In previous years the majority of failures have been due to overheating. Whether the absence of this trouble this year was due to more efficient engines, three-speed gears, or to the fact that the condition of the hill had improved, would be interesting to know. My only difficulty here was to average 20 m.p.h., as the hill was too steep for high gear and not steep enough for low, and to average 20 m.p.h. for five miles on a 10 to 1 gear was a somewhat trying undertaking. However, apart from somewhat violent boiling, no difficulty was experienced. The Auchnashellach check was missing, and at Jeantown, some ten miles further on, Downie, on the A.J.S. sidecar, presented a somewhat comic spectacle, careering along, wildly shouting for the check; he evidently had "some" fright, for his was one of the very few passenger machines still in for a "gold." The last two days were practically the first two days' routes reversed, the only improvement being that fine weather prevailed. Many cases of hard luck occurred as usual during these two days; for instance, A. H. Alexander (Douglas and sidecar), who up to this point had a clean sheet (a marvellous performance for a 4 h.p. and sidecar), failed on Glendoe owing to the contact screw working loose. An even harder case was that of Dean on the Ariel, who fell, and before he could get out of the way a Harley-Davidson and sidecar had run into his machine, putting it out of action.

Few Tools and Spares.

My only troubles in the last two days were a puncture in the Tomintoul-Cockbridge section. A broken high gear chain in the last section completed my list of troubles, but I fitted a new link in eight minutes.

It was fortunate for me that my troubles were so few, for never before have I ridden through so arduous a trial with so few spares and tools. My tool-kit consisted of one spanner (adjustable), wire screwdriver, hammer, three tyre levers, a chain punch, and tyre pump. As the hills gradually faded away in the blue distance when we neared Edinburgh again I found myself feeling relieved that the strain of driving to so strict a schedule over such trying routes was over.

A few hours spent in preparation for the homeward trip, which was started on Sunday morning: two days' glorious blind without fear of checks, and we find ourselves at the end of, on looking back, a most pleasant holiday.

The Morgan weighed 8 cwt. 3 qr. 14 lb. complete with passengers, luggage, spare petrol, oil, water, etc., as ridden in the trial. It caused much amusement among the Scottish children, and was generally designated as "The wee red 'un." B. ALAN HILL.

CLUB NEWS.

Bristol M.C.C.

The Bristol Motor Cycle Club will hold a members' hill-climb at Blagdon. There will be eleven classes, ranging from miniatures to light cars, which will be run off in pairs, as the hill is wide and safe.

The Dunheved (Launceston) and District M.C.C.

The Launceston district not being provided for in the shape of a motor cycling club, several leading riders recently foregathered and inaugurated the above, appointing Mr. Maurice Prout as secretary.

Woolwich, Plumstead, and District M.C.

Members and friends of the above club are invited to assist in the marshalling and marking of the course for the South-eastern Counties Inter-team Trial on Saturday, August 16th, 1919.

All communications to be made to the hon. sec., Mr. F. J. Ellis, 3, Nightingale Place, Woolwich, S.E.18.

Reading and District M.C. and L.C.C.

The first run of the newly formed Reading Club was held on July 27th, and an attendance of twenty-five was recorded. Alms Hill was the venue, and, the surface being excellent, several made good climbs.

Ballymena and District M.C.C.

A novel competition was recently arranged by the Ballymena and District Motor Cycle Club, with a view to demonstrating the advantage of benzole in the matter of consumption. The course was accurately measured, and to secure consistent driving a speed judging test was included, the first circuit of twenty-three miles being covered on petrol and the second on benzole. All the competitors found decreased consumption with benzole, in one case the rider obtaining a 50% better mileage per gallon, the average increase of mileage being 30%.

Future Events.

Aug. 9.—Bristol M.C.C. Members' Hill-climb at Blagdon.
Aug. 10.—East Midlands Associated Clubs. Social Run, Monsal Dale.
Aug. 10.—Reading and District M.C. and L.C.C. Run to Burnham Beeches.
Aug. 10.—Birmingham M.C.C. Social Run to Monsal Dale.
Aug. 10.—Rochester, Chatham, and District M.C. Secretary's Surprise Run.
Aug. 16.—Rochester, Chatham, and District M.C. Competition for Woolwich Cup.
AUG. 16.—S.E. COUNTIES INTER-CLUB TEAM TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL FOR THE PALMER CUP.
Aug. 16-17.—Oldham and District M.C. Reliability Trial for Bradbury Cup.
Aug. 16-17.—Wolverhampton M.C.C. Reliability Trial to Barmouth for the Eric Williams Shield.
Aug. 17.—Rochester, Chatham, and District M.C. Run to Herne Bay.
Aug. 22-23.—Essex M.C. Annual Run, Woodford to York and Back.
Aug. 23.—Birmingham M.C.C. Hill-climb.
Aug. 24.—Rochester, Chatham, and District M.C. Run to Wateringbury.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 31.—Birmingham M.C.C. Social Run.
Aug. 31.—Rochester, Chatham, and District M.C. Run to Hawkhurst.
Aug. 31.—Woolwich, Plumstead, and District M.C. Picnic and Gymkhana at Brasted Hill.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
Sept. 6.—Birmingham M.C.C. Reliability Trial for Songster Cup.
SEPT. 15-20.—A.C.U. SIX DAYS' RELIABILITY TRIALS.
Sept. 19.—Essex M.C. Gymkhana.

Sheffield and Hallamshire M.C.C.

The recent trial of the above club for the Stacey Cup from Sheffield to Pickering and back *via* Thirsk and Sutton Bank proved very interesting, in so far as eight of the fourteen entries were unsuccessful in climbing the famous hill at the first attempt. Only three competitors checked in on time at the top of Sutton, these being D. Kaye (4 Triumph), S. Sawyer (4 Norton sc.), and A. Flint (8-10 Morgan), and as they all finished without trouble the cup winner is amongst them, but the check sheets are not yet in.

The Public Schools M.C.C.

At a recent committee meeting twenty-three new members were elected. A full programme has been arranged for the month of August, so as to give public school boys on their holidays a chance to take part in these competitions, and to make the acquaintance of their fellow-members. The events decided upon are the following:

August 16th.—Surprise competition. Meet at Purley Corner 2 p.m. Entries close August 12th.

August 23rd.—Day run to Alms Hill. Novel hill-climbing competition.

August 30th.—Hill-climb. Entries close August 12th. The usual classes will be run, and a special prize is offered to riders of two-stroke motor cycles if at least five entries are received of this class.

Ealing and District M.C.C.

Major Low's Petrol Consumption Trial will be held on Saturday, 16th August, at 3 p.m. The venue will be on the Portsmouth Road, 1 mile before the Hut Hotel, Wisley (at the corner of the by-road on the left travelling from London).

A 1½ mile course will be taken by competitors. Horse-power, weight, age of machine, and windage will be taken into consideration in determining results.

After the trial a ticket will be given to each competitor, showing the consumption of his machine. Competitors will choose their own speed up to legal limit. Major Low will act as one of the judges and is presenting a Thermos flask to the winner. The trial is open to members at an entrance fee of 2s. 6d., but all riders are invited to come and witness this interesting event.

Major Low's special apparatus, which up to the time of the signing of Peace was a jealously-guarded secret, will be used for the first time in a public trial. The event will be closed by a social run and tea at a near-by hostelry.

A SPORTING HALF-DAY TRIAL.

THE closed reliability trial held by the North Birmingham Motor Cycle Club on Saturday, July 26th, was one of the most successful half-day events yet held in this district. The course was a secret one, and the route cards supplied at the start were not marked by any names of places, but had been drawn up very clearly, and gave directions such as "Turn right at stone cottage, over brook bridge, first turn left," and so on. Of course, this meant that the careless unobservant rider very soon lost his way. The start was from headquarters, the Acorn Hotel, Erdington, where twenty competitors faced the starter. Among then was Miss N. Hough on a Skootamota, the only scooter entry. The speed allotted to the motor cyclists was 18½ m.p.h., but the officials made a special concession for the scooter to run at 13½.

The course ran through Sutton Coldfield on to Lichfield. Here the non-stop section commenced.

Leaving Lichfield, and getting into the by-lanes, competitors soon realised the nature of the trial—a steep, rutty hill, under observation, soon hove in sight. No one appears to know the name of this hill, but quite a few will respect it in future.

Gentleshaw Hill was the next item. The gradient here is 1 in 7, but the surface very bad. Here the official reported that the tiny scooter scored over the others.

The watersplash (which was fairly deep in places) presented no difficulties to the scooter, which reached the other side without any mishap. Other competitors who were still in the running got across well, some charging it at speed, and others using more discretion. Two more rough hills and the brake test followed. The hills knocked out one or two more riders, and the brake test was rather severe. A warning of thirty-five yards was given, but this was not sufficient for some. J. R. Brock did not pull up his big combination until fifty yards past the tape. J. R. Roberts (2¾ Douglas) shot past and pulled up in thirty-five yards.

Several competitors approached from the bottom of the hill, having lost their way, and naturally, wondered what the tapes were for. Every competitor had commenced the run with a hundred marks to his credit, and the penalty here was a mark for every foot past the tapes. The last observed hill followed immediately, and was in the neighbourhood of Stile Cop, Rugeley; this hill was in better condition than the previous climbs.

At the start of the trial each man had received a sealed envelope with instructions not to open unless hopelessly lost. One or two men who had lost no marks on the course had lost their envelopes, so were disqualified.

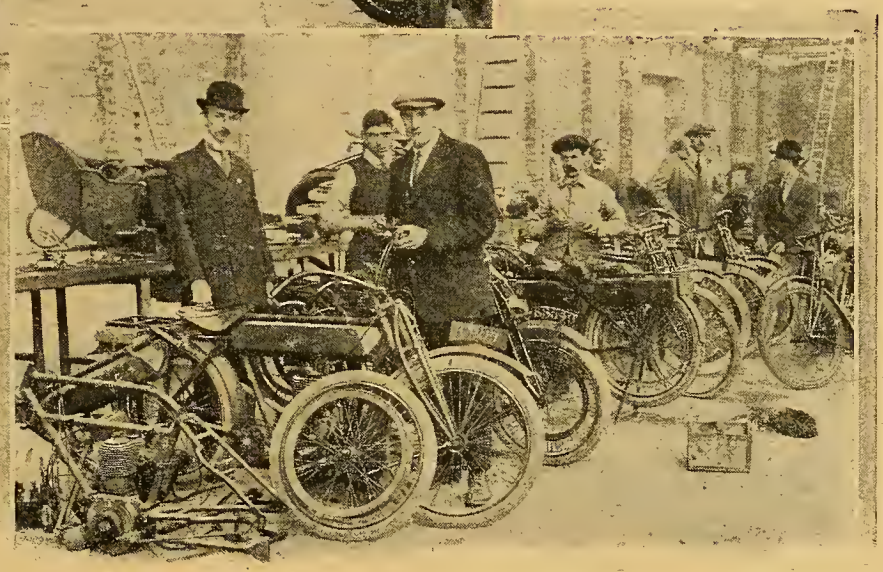
The chief award for best performance of the day went to Miss N. Hough, 1¾ A.B.C. Skootamota, who climbed all hills, passed the hairpin, watersplash, and brake tests satisfactorily and without loss of marks, and finished within 1m. 24s. of her allotted time schedule of 13½ m.p.h. This lady, therefore, takes the Bayliss Trophy, club gold medal, and also the special prize for best performance by a fixed gear machine.

The second prize, together with club silver medal, goes to Seymour Smith (2¾ h.p. Ivy two-stroke).

Third prize, and club bronze medal was won by F. Southern on an 8 h.p. Morgan.

FROM WAR TO PEACE.

A Visit to the Slough Motor Depot.



(Left) Overhauling engine at the Slough motor cycle repair shops.
(Right) Inspectors examining work.

SO much has been heard of the Slough Motor Depot scandal that it is somewhat refreshing to be able to give a short account of the work carried on there.

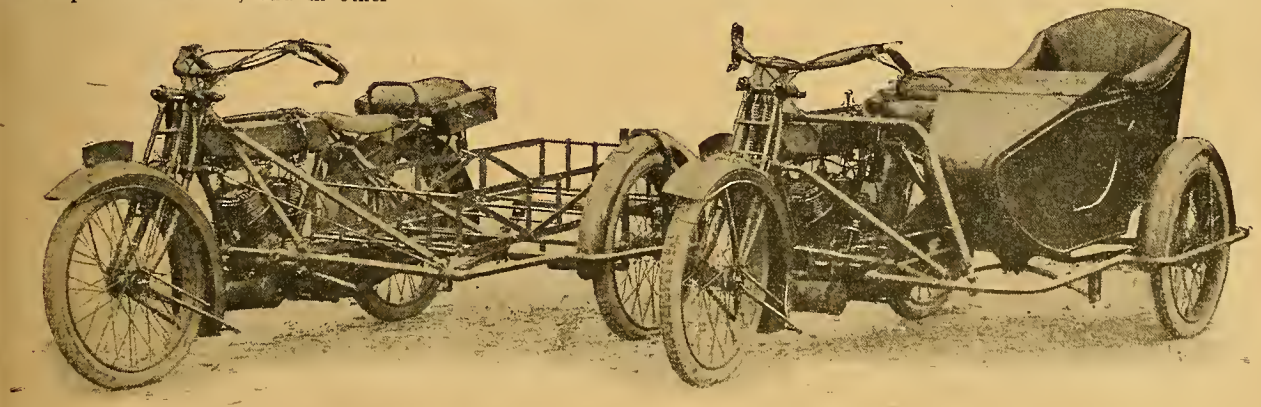
Few of our readers have ever had any inkling that a large number of motor cycles of all kinds are overhauled at the Slough Motor Depot. At the present time some 200 machines per week are turned out, but the output is shortly to be increased to 250 to 300 per week. All machines to be repaired are mounted on special benches 2ft. high, so that the men can work upon them conveniently. A special depot is set aside for the repair of magnetos, while the vulcanising of tyres is also carried out. A sound job is made of all the repaired machines, but no attempt is made to finish them artistically.

We were shown over a whole shopful of repaired motor cycles ready for disposal. Among them were a number of J.A.P.-engined Clyno sidecar outfits, provided with special carriers for ammunition. These are in some cases being used for the transport of milkcans, and in other cases they are being removed altogether so that any sort of box body may be fitted.

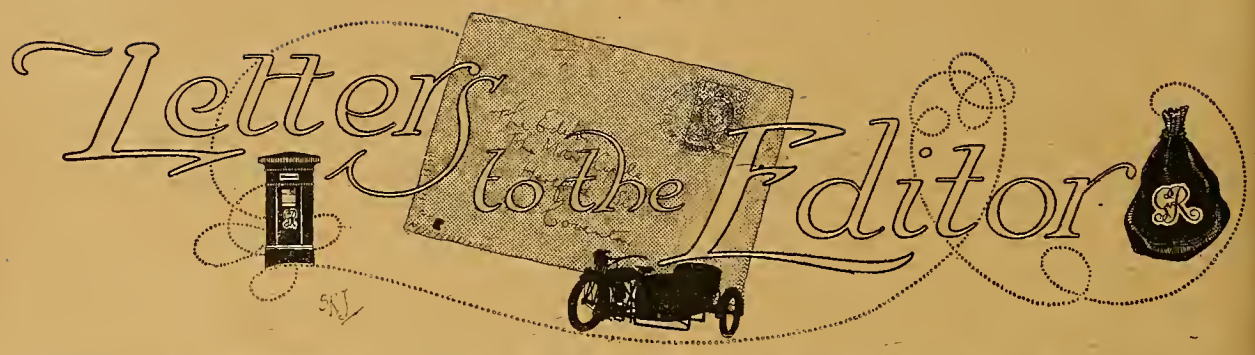
War Motors Association.

In view of what has been written lately concerning the War Motors Association, we had a long conversation with Col. Holbrook on this subject, and the information he gave us did not exactly agree with that given to us by the Association. According to Col. Holbrook, the machines will not be sold on application through the A.C.U. to the War Motors Association at a reasonable price, but at full market value, less some trivial sum of, say, 2½%. The Disposal Board is openly out to obtain the best possible prices for Government stores, consequently the discharged soldier will have merely the privilege of buying direct and not through an auction, and very little reduction in price will come his way.

This information will no doubt be received by our ex-Service readers with considerable disappointment, and we regret that there seems little likelihood of any special consideration being given.



The machine on the left is a Clyno fitted as an ammunition carrier, and that on the right a rejuvenated passenger outfit. Several of the ammunition carriers have been sold as they are for carrying milk cans.



The Editor does not hold himself responsible for the opinions of his correspondents.
All letters should be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

AN EMERGENCY TUBE.

Sir,—I recently got stranded with a burst tube on my Harley-Davidson machine, and was unable to get another. An idea suddenly struck me that perhaps I could manage to use a "push" bicycle tube 28in. × 1½in. in my 28in. × 3in. cover. This I did quite satisfactorily, and put enough wind in the tube to make the tyre quite hard, and rode a further sixty miles, non-stop, to my destination. My machine is a very heavy one. C. P. BESWICK.

SMART WORK.

Sir,—It was my misfortune to break the chain-stay connection of my combination last Saturday, between Reading and Basingstoke (and I noticed that I was not the only one with that complaint, owing to the shocking state of the roads). But I write this in praise of the manner in which Messrs. Grover and Smith, of Basingstoke, tackled a very nasty repair, notwithstanding the works being closed for the holiday. Mr. Grover himself undertook the case, and turned me out a really "top-hole" job at an extremely moderate price, in double quick time. It is refreshing, after being "told off" recently by five repairers in Clacton for quite a simple matter, to find a quick and willing man.
Saffron Walden. H.K. 4441.

FINDING A WINNER.

Sir,—In your issue of July 17th you publish a letter from Mr. J. L. Norton setting forth certain tests to be embodied in the Birmingham motor cycle open passenger trial. This letter was most unfortunate on the eve of the trial, and was likely to mislead competitors as to what they had to do, the allowances to be made, and the method of carrying out the tests.

Mr. T. Silver and myself were joint hon. trials secretaries for this trial, and if publication affecting it were left to the officials appointed by the club, conflicting statements would be avoided.

The details given by Mr. Norton were discussed at a meeting, but the trial printing was then already out. However, I hope the "Stable" information did not upset the riders, and that for the future those responsible shall be the ones to rush into print. S.-KEMPSON JONES.

AMATEURS IN COMPETITION.

Sir,—I should like to call the attention of particularly the various club officials and committees to the present position of the genuine amateur in competitions, especially hill-climbs, which, I am afraid, is far from satisfactory, and could do well with reform.

To begin with, why is it that in all competitions the "professional" rider, or one who is interested directly or indirectly with the manufacturer, is allowed to compete with the amateur on the same level when the former has such a huge and unsporting advantage over the latter? Or, to put it more fully, is it fair for a genuine amateur who can only make a few minor adjustments to his machine in his spare time, prior to entering for a hill-climb, to compete against a man whose work it is to know every particle of his machine and how it is made, who is given by the makers a machine in absolutely tip-top trim both mechanically and in every other conceivable detail (and this absolutely regardless of time and expense), and who in some cases actually brings his machine to the venue of the climb on a conveyance from the works?

And yet these two are asked to compete against each other on the very same footing. It cannot for one moment be contended that the unfortunate amateur has the slightest chance against the "pro," and to overcome this unfairness why cannot there be a class or classes for amateurs only, and, if only one class, for the result to be worked out on formula?

Again, even in a reliability trial, the "pro." who has ridden in so very many of these, and whose firm will spend plenty of money on new tyres, etc., has an undoubted advantage over the amateur who takes his motor cycle just as it is for the sport of the thing.

I think it would be a really good move for the club officials and committees to reform their usual arrangements in this respect, as the tendency now is without doubt for the real amateur, however keen and however sporting, to give up all hope of taking part in competitions under the present arrangements. C.L.W.

Malvern Wells.

SERVICE.

Sir,—While the question of service is receiving attention in your columns, may I draw attention to the habit of some manufacturers of making promises of despatch which they have no intention of keeping.

Their promise of despatch in a few days tempts one to keep an engine running with a makeshift device. When the part eventually does arrive it is found the makeshift has caused serious wear or damage.

Manufacturers would be better advised to state a date by which they will despatch rather than "promise." One could then make adequate arrangements.

A purchaser feels satisfaction when goods arrive on or before the specified date, but his feelings are the reverse when he has sent cash with order and waits several weeks after the promised date.

Manufacturers should realise that their advertisements carry no weight when one of their customers advises one not to deal, and also that motor cyclists do compare experiences with one another. DAMAGED PULLEY.

Co. Meath, Ireland.

THE CHEAPEST MOTORING FOR TWO.

Sir,—In *The Motor Cycle* of July 24th, I notice a letter by "Private Owner" on the subject of "Cheapest Motoring for Two." I have been a motor cycle enthusiast for about four years, commencing with the smallest of lightweights and ending with a 6 h.p. sidecar outfit, sampling various types of machines in the interim up to that horse-power. I fully appreciate "Private Owner's" point when he says: "'overalled, disreputable, up to one's eyes in dust or mud' days of motor cycling."

I am now in possession of a runabout, and, without doubt, for those who want a private motor vehicle with protection from the elements and efficiency, and yet who cannot afford a car proper, a runabout type of machine is certainly "the goods." In short, two persons can travel enjoying the comfort of a car and with the speed of a sidecar outfit, and, in some cases, possibly faster. These miniature cars, moreover, have amongst their ranks excellent hill-climbers. Petrol consumption may be slightly heavier, but surely that is not a great fault. Expensive sidecar outfits have a serious rival in cycle cars, for, over a three-wheeled runabout, a sidecar outfit has no points to commend it.
Chatham. SPEED AND COMFORT.

SPARE PARTS.

Sir,—I had the misfortune to be run into by another motor cyclist who came round a corner on his wrong side. The two bottom shackles and the back bottom spindle of my front forks were rendered useless. That same afternoon I wrote to Messrs. Robinson's, of Green Street, Cambridge, asking them to forward me the parts by letter post, and enclosing an amount which I was certain would easily cover the cost. The parts arrived by return of post.

Egglescliffe. HIGHLY SATISFIED.

Sir,—In these days when repairs seem to take such a time to be done, it is most gratifying to find a firm who not only have spare parts available for early models, but, futhermore, give immediate attention to the needs of their customers. I refer to Messrs. Chater-Lea, Ltd., of Banner Street, E.C.

Having some trouble with the clutch on a second-hand machine of their make I took it to London and had it dismantled, the necessary new parts supplied and fitted, and the whole thing reassembled and adjusted in under ninety minutes, and received from everyone with whom I came into contact at the works both courtesy and interest of a type which must not only ensure old customers remaining satisfied but make new ones.

I am not interested in the firm in any other way than as a private rider of a Chater-Lea machine, who appreciates treatment of this description, and trust you will find space in your paper to publish the foregoing. E.M.

Worthing.

Sir,—I see by the letters from the readers of *The Motor Cycle* that there is a large amount of negligence in regard to the supply of spares to second-hand machines. I have had a similar occurrence myself, and it will probably save many people a good deal of inconvenience if it was published. Fifteen weeks ago I sent an Armstrong gear to a firm near London, who were advertising repairs to any gear inside twenty-four hours. A week later the invoice arrived asking for it to be settled at once so as to get the repairs in hand. The cash was sent by the following post, and three weeks later I received the wheel, but as it was very unsatisfactory and could not be used I had to return it again to the repairers.

Since then they have not acknowledged the receipt of the wheel, or answered any letters written to them about it. Recently I wrote asking them to return the wheel repaired or otherwise, but again they refuse to acknowledge the letter. I should be very pleased to give the name of the firm to anyone interested, or who may have hub gears to repair, to prevent any similar occurrence. H. HAWES.

TWIST GRIP CONTROL.

Sir,—May I add a word in support of the letter of "Captain, R.H.A.," in your issue of July 10th with regard to what "Ixion" calls "Yankee stuff"?

The superiority of the twist grip over the ordinary system of control is incontestable both as regards reliability and easy working. I only know of two cases of breakage in three years' experience of pre-war Indian motor cycles. Other advantages of this American twin which come to memory are: A smoother running and more accessible engine, stronger wheels and, last but not least, the great civility shown by the manufacturer to the private owner in small matters. I ran a 1913 6-h.p. twin fitted with what was popularly supposed to be the best British engine of its type for a year, but cannot say that, either in reliability or workmanship, it came up to what I hoped after the "Yankee stuff," but, of course, I may have been unfortunate. CAPTAIN, R.E.

France.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—I have noticed correspondence in your journal from motorists who criticise the motoring bodies, and assert that they are merely receivers of subscriptions, giving nothing of value in return.

I am a member of the A.A. On the 16th June I reported the theft of my motor cycle combination to the Association, and they immediately circulated among the A.A. road patrols a description of the machine. On the 19th I was agreeably surprised to learn by telephone that a patrol had found my machine in a country garage sixty miles from my house. Within three hours I identified it as mine!

Others may belittle the advantages of membership of the A.A. and doubt the efficiency of and necessity for A.A. patrols. Personally I never had any doubts on the matter, and now I have had an experience of their value.

R. POLITI.

SPEED JUDGING.

Sir,—I was very pleased to see in *The Motor Cycle* dated July 24th that the Sheffield Club intend organising a speed-judging competition, when the police will be invited.

I was recently stopped, and subsequently fined, for driving a motor cycle to the public danger. The uniformed representative of law and order who stopped me informed me in a very authoritative tone that I was travelling at 40 m.p.h. Of course, it is not always wise to argue with "Robert," so I let the remark pass by, saying my speedometer never told lies. As a matter of fact, I was travelling at 28 m.p.h. according to my speedometer, which was perhaps above the limit at the spot where I was stopped.

However, the above incident goes to prove that the pedestrian generally has very little notion of speed-judging.

Abergele. A SPEED MERCHANT.

PLEASE QUOTE PRICES!

Sir,—I feel that a statement made by H. T. Bartlett in in your issue of the 24th of July should not be allowed to pass unchallenged.

While expressing his opinion on the question of the inclusion of prices in manufacturers' advertisements appearing in your columns, he refers to the lack of courtesy shown by some firms through failure to answer enquiries even when stamped addressed envelopes are enclosed.

The statement is wholy illogical, since failure to reply to a communication may be due to a number of causes, discourtesy being the least likely of any.

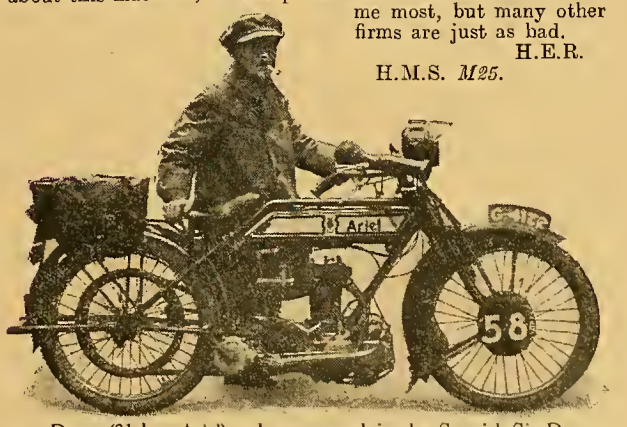
The most prevalent reason is that the resources of nine out of every ten firms are, owing to the changing over from war to peace-time production, hopelessly overtaxed, with the result that both works and offices are congested to a degree never known before. Add to this the unprecedented number of enquiries for machines, engines, and parts due to five years' "famine," and it will be seen that the manufacturers are not so black as painted by your correspondent.

R. W. PAUL.

Sir,—I have been a subscriber to *The Motor Cycle* since 1906, and, as far as I can remember, regularly, every year the same complaint has appeared about the lack of information contained in the advertisements. Many advertisers seem to be quite indifferent to the fact that *The Motor Cycle* penetrates into many inaccessible parts of the world. Take my own case, for example. By the time *The Motor Cycle* has managed to get through the barrage of postal and transport officials up to the North Dvina front about six weeks have gone. Having at last received my paper, I eagerly turn to the Scott advertisement, as I am very much attracted by this machine, but what do I find? Not a word as to the price or date of delivery; not the name of a single agent. Personally, I feel very much inclined to bother no further about this machine; I have picked out the case that interests me most, but many other firms are just as bad.

H.E.R.

H.M.S. *M25*.



Deans (3½ h.p. Ariel), who competed in the Scottish Six Days Trial, had a clean sheet until the fifth day, when he fell in front of another competitor, receiving slight injuries to himself and having his machine badly damaged.

MERCURY AS AN AID TO COOLING.

Sir,—The letter of "C.O.P." will by now have caused a tremendous stir in all chemical and metallurgical circles. Here we find announced a most epoch-making discovery, *i.e.*, that mercury Hg in contact with aluminium Al in a confined space so reacts as to form aluminium oxide.

This constitutes getting something from nothing, or, rather, oxygen O from two other *elements*, upsets the whole atomic theory, and should revolutionise modern chemistry, giving grounds for new processes for the manufacture of oxygen, corundum, alundum, and many other substances. Perhaps "C.O.P." will be kind enough to give us a few details of his brain-wave, or, at any rate, the equation by which he gets his reaction. Failing that, he might perhaps give us a few tips on perpetual motion, which comes in more or less in the same street. F.M.

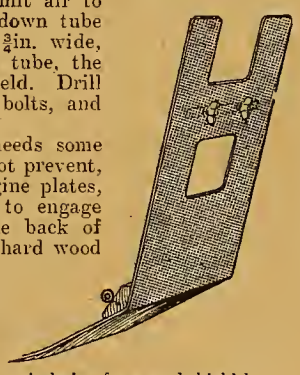
Aylesbury.

THE MUDGUARDING PROBLEM.

Sir,—I wonder why motor cyclists, especially those who use motor cycles in all weathers for business purposes, do not exercise a little ingenuity and provide themselves with front mudshields. Even in fine weather the town rider has to ride over watered roads, and the front wheel invariably sprays his legs with muddy liquid.

I have used a solo machine for occasional professional journeys since 1911, and I soon found that overalls did not enhance my appearance on such occasions. The remedy was simple, and so easily applied that I have not ridden without a shield for at least seven years.

My method was to take a sheet of three-ply wood, about 18in. wide and long enough to reach from the top of the tank to near the bottom of the crank case. Cut a slot for the tank, a square hole to admit air to the cylinder, and clip to the down tube by two flat iron strips, about ¾in. wide, one bent to go half round the tube, the other flat on the back of the shield. Drill the strips and shield for two bolts, and secure with wing nuts.



A design for a mud shield by "Anti-overalls."

The bottom of the shield needs some staying. If the silencer does not prevent, an easy way is to drill the engine plates, and push a ⅜in. rod through to engage with ⅜in. screwed eyes on the back of the shield. Distance pieces of hard wood screwed to the shield to carry the eyes make a better job, and may be utilised to carry a backward extension of the shield under the crank case.

The comfort of the arrangement has to be experienced to be believed. Your feet and legs escape all mud, and may be garbed to taste, provided your engine is not of the oil-slinging breed; also most of the draught is kept off your legs. The engine, and all parts from the steering head to the back mudguard, keep much cleaner.

For wet weather, wear leather leggings to keep the rain out, and to protect from the knee upwards there is nothing to beat a good length Burberry (*not* the motor cycling design, which is too short). Take a full length coat which has a long slit behind. Attach press buttons to front edges of coat (inside) and to back of skirts (outside) in such positions (found best by experiment) that, when sitting with the tails brought between the legs and turned each side over the thigh and *under* the edge of coat and press-button fastened, the pair of loose knickers so formed reach well over the knees. You can "paddle off" without opening the fasteners, and, if you *do* get caught up on any projection, the fasteners open to a pull and relieve the strain.

As to appearance, the dress looks quite "Christian" either on or off the machine—undo the press buttons before you call on your rich aunt!—and the shield is certainly not unsightly. The best disguise for the shield, if of wood, is a coat of *dead* black paint.

The most effective and best-looking of proprietary shields that I have seen is a moulded (*papier mâché*, I think) shield which is supplied as an extra with the "James" big single. I used one on a sidecar outfit for two years in all weathers doing special police duty, and never wore overalls; yet the spotless condition of my black boots and leggings (black was "regulation") in bad weather always roused comment.

A mudshield is certainly worth while, but, to be satisfactory, it needs to be designed for the machine, and if the manufacturer of your particular "iron" does not specialise a shield to fit I should say "make one yourself." But—anchor it firmly, or the rattle will drive you crazy.

As to windage and inadequate cooling, I know a solo with 2¾ h.p. (75 mm. × 75 mm.) engine of about 1908 vintage, fitted with shield as above described, which will touch 40 m.p.h. and keep up 30 m.p.h. indefinitely without any signs of overheating, which isn't bad for an "old 'un."

ANTI-OVERALLS.

PILLION RIDING.

Sir,—Mr. A. C. Robbins's remarks on pillion riding make me feel more sorry for him than anything else. If the passenger on the carrier sits well forward and the rider assumes a semi-T.T. position, the resultant centre of gravity of the two bodies works out at practically the same position as the rider who uses touring bars and sits bolt upright. For instructional purposes I always sit on the carrier with people riding their first motor bicycle, and find it a simple matter to balance the machine. I have ridden many thousands of miles with various passengers on the carrier, and have ridden on the carrier for many more. I have, incidentally, tried several sidecars, and have, on each occasion, come to grief. On more than one occasion I have travelled at speed with two people on the carrier, and have never had any accident. Y.C.

H.M.S. *Barham.*

Sir,—I have been interested in the opinions expresed in recent issues regardiug the dangers of pillion riding.

My own experience on all the machines which I have owned or ridden is that the danger is almost entirely due to weight distribution on the machine, and not to carelessness or lack of skill on the part of the driver.

With a heavy person in the saddle and a lighter one on the carrier, very little difference is noticed in steering or control, but, when the positions are reversed, the machine immediately becomes unmanageable and dangerous.

Bramcote. F.W.H.

Sir,—I should like to endorse the statements of "Regular Flying Officer (Pilot)" on the above subject.

Though my machine is capable of taking a sidecar, I do not care to pay the exorbitant prices now in vogue. Also, I have not, as a demobilised officer, the means of affording even a cheap one. Therefore, if I want to take a passenger my carrier must do the work.

I cannot agree with your correspondent, Mr. A. C. Robbins, in your issue of the 24th ult., wherein he points out that "motor cycle pillion riding is most dangerous, and acknowledged as such by those *who indulge in this practice.*" Surely those who consider it a dangerous pastime should be the very people to abstain from indulging in it. Of course they may be, and probably have been, carelessly unfortunate—history does not record.

There certainly is no necessity for a spill, when proper care is observed through villages, past turnings, etc.

Many will agree that, when once pillion riding has been made an offence, motor cycling as a sport will lose a great deal of its charm, and the stranded rider will be without that friendly lift, which is part of the courtesy of the road.

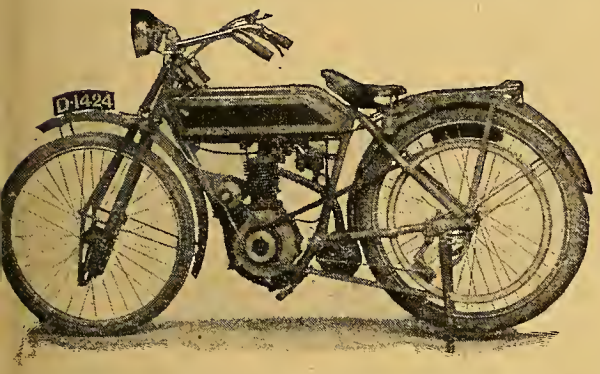
A New Dynamo Lighting Set.

A Compact Generating Unit. Minimum of External Wiring.



The Mortley motor cycle dynamo set fitted up in 1913 to a 1904 Quadrant and still working satisfactorily. In this case the generator supplies current for the ignition as well as the lamps.

MOTOR cyclists will be interested in a dynamo lighting set suitable for solo machines which Messrs. G. E. Mortley and Co., Nelson Road, Tunbridge Wells (now engaged upon aircraft wireless generators), hope to manufacture in quantity in time for the next lighting season.

The set is very neat in appearance, and is well finished, the equipment comprising the dynamo, which incorporates the governing device, and an automatic battery switch; a compact battery specially designed to stand vibration; a light but robust head lamp, with enclosed focussing lamp holder and a well made reflector; a cast aluminium tail lamp, the holder withdrawable for use as an inspection lamp; and a combined switch, battery, and meter box designed to be fitted to the top tube.

Tested Since 1913.

The automatic switch referred to above is operated by centrifugal force, which renders the whole of the electrical output of the generator available for lighting.

A noteworthy feature of the outfit is the extreme simplicity of the wiring. The whole equipment requires but three leads radiating from the switch box: one to the generator, one to the head lamp, and one to the rear lamp. This has been made possible by the simple system of switch gear, details of which are not available for publication at the moment.

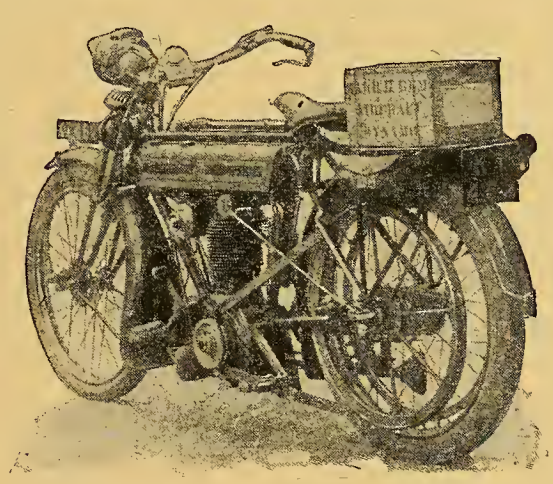
The Mortley dynamo and ammeter showing the pulley for attachment to the engine shaft.

One of the illustrations shows an outfit fitted in 1913 to a 1904 Quadrant, one of the earliest dynamo lighting sets fitted to a motor bicycle. In this case, the dynamo supplies current for the ignition as well as for the lamps and horn.

The dynamo has a normal output of 20 watts, a voltage of 5 volts (15 volts open circuit), the battery weighs approximately 5 lb., the head lamp 2 lb. 3 oz., the tail lamp 4 oz., the Popular type of switch 9 oz., while the total wiring weighs 7 oz.

Two sets are to be supplied to the public: one known as the Popular, and the other as the De Luxe.

The dynamo set in question is on view at the British Scientific Products Exhibition, Westminster Hall, London, S.W.1.



A dynamo lighting set fitted to a 3½ h.p. Triumph. Note the ammeter on the handle-bars.

LIGHTING REGULATIONS.

FOR the benefit of those who are not *au fait* with the requirements of the authorities for England, Scotland, and Wales, the Automobile Association has issued the following simple digest of the lighting regulations:

Between half an hour after sunset and half an hour before sunrise every motor car and motor cycle with sidecar attached must carry:

(A.) Two front lamps displaying white lights—one on the *extreme offside* and the other on the *extreme near side* of the vehicle.

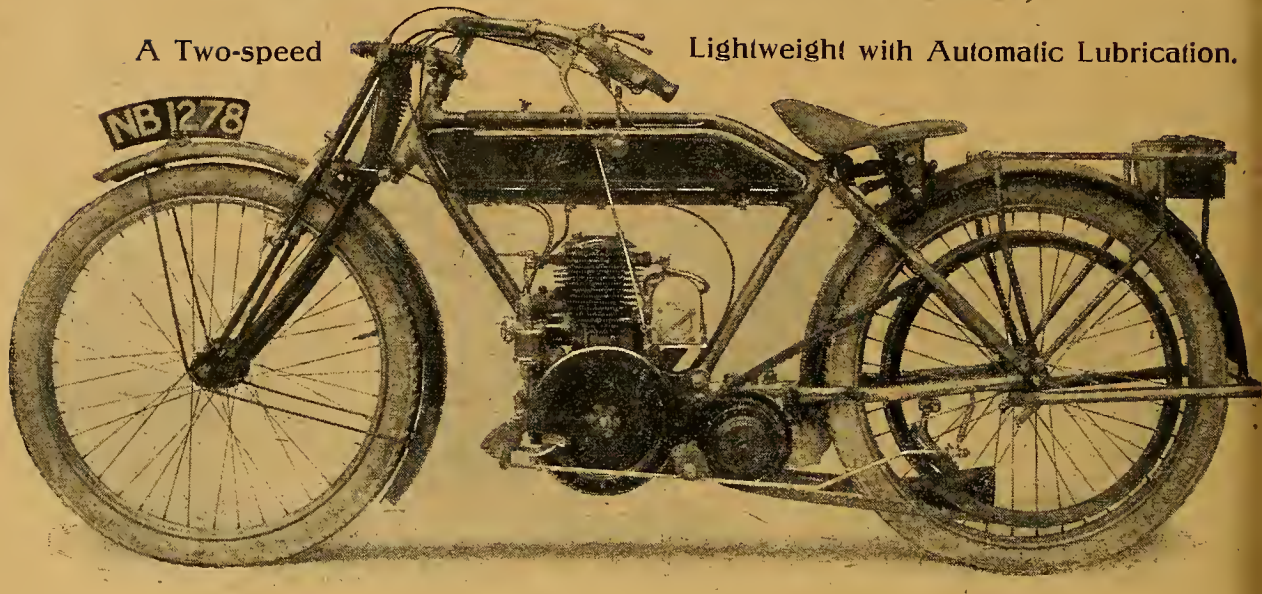
(B.) Rear lamp displaying a red light to the rear on the *offside of the vehicle.*

DON'T have an ELECTRIC lamp exceeding or giving greater candle-power than twenty-four watts.

DON'T have an ACETYLENE lamp consuming more than twenty-one litres (or threequarter cubic foot) per hour. If these powers are exceeded or the diameter of the front glass exceeds 5in., obscure (with a thickness of white tissue paper, or other material of similar obscuring effect), the whole of the front glasses of electric or acetylene lamps.

The Scale 350 c.c. Two-stroke.

A Two-speed Lightweight with Automatic Lubrication.



The improved Scale two-speed two-stroke model, fitted with a 350 c.c. engine and automatic lubrication.

THE Scale two-stroke motor cycles enjoyed quite a good reputation for sturdy construction before war requirements compelled their temporary withdrawal from public notice.

The makers, Roberts and Hibbs, Bank Street Works, Droylesden, Manchester, are now re-entering the field with a much improved model embodying the "Precision" 350 c.c. two-stroke engine which we described in our issue of May 29th last. This engine, as our readers are no doubt aware, is automatically lubricated from the sump, the magneto driving chain being used as the oil distributing agent.

Two types are being made, a plain two-speed model and a two-speed, clutch and kick-start model, listed at 65 and 70 guineas respectively.

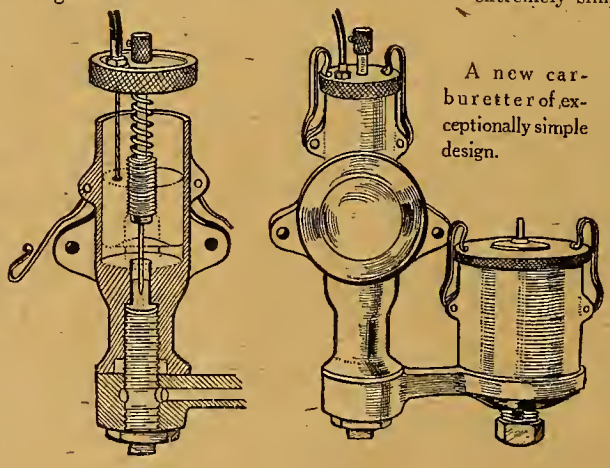
Frame construction is on standard lines, and special attention has been paid to securing comfort for the rider by corporating Brampton Biflex forks a an XL'All saddle. The tank tap slightly to the rear, and has a large pet capacity, since all the oil is carried the engine. 26×2¼in. tyres are fitt and T.B. magneto and Amac carburet complete the specification. The gene appearance of the machine is very go being finished in deep crimson, lir black and gold with grey panelled tan

The S.U. Single Lever Carburetter.

IT is exceedingly gratifying to note that several firms, who have studied the question of carburation for years, and have made their names by supplying carburetters to high-class motor cars, are at last turning their attention to developing an efficient one-lever carburetter for motor cycles.

The S.U. Carburetter Co., 154, Prince of Wales's Road, Kentish Town, London, N.W.5, are hardly new-comers into the motor cycle world, as they made quite an efficient little carburetter for motor cycles in 1914, and, with one of these, which worked on the well-known S.U. atmospheric principle, we gained a gold medal in the Edinburgh Run in that year on a 2¾ h.p. Douglas. The later model, however, no longer employs the atmospheric method.

The carburetter works in the following manner. In the vaporising chamber there is a barrel which is moved up and down by means of a Bowden wire controlled by a lever on the handle-bars. In this barrel there is screwed a tapered needle holder, and the tapered needle held in this passes up and down the jet orifice. In the closed position, the jet is completely cut off, and the air is also shut off, and it will be seen that the throttle barrel has the dual capacity of air and throttle control, with the result that we get the simplest form of carburetter known, namely, the straight-through pattern. The tapered needle holder is screwed into the barrel, and can be controlled from the exterior of the carburetter by means of a small milled nut, the spring shown in the illustration serving to prevent the nut from turning through vibration. As the throttle is opened, more petrol and more air, in correct proportions, are admitted to the engine.



A new carburetter of exceptionally simple design.

The external adjustment allows t driver to thin down the mixture so th he may run at ordinary touring spe as economically as possible, and when wishes to hurry or arrives in a hi district half a turn of the milled nut v enable him to get the full power out his engine.

One of the chief advantages of the S. motor cycle carburetter is that it extremely simple, and that there are o about ten moving pa It works on the w known S.U. princi except that in this c the control is mechani and not atmosphe

It must be underst that this carburetter not intended to be s denly opened, and it necessary, therefore, open the throttle gra ally, when excell acceleration, with ple of power, will be tained. The slow r ning is perfect, as it possible to do a fig 8 in the road on gear with the eng firing slowly and re larly.

QUESTIONS & REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Knocking.

My countershaft 3½ h.p. Rover motor cycle goes well on the level, but knocks and stops on a slight incline. I have tried a new carburetter without any improvement. The M-L magneto gives a good spark. Valves timed as follows: exhaust closes dead on top of exhaust stroke. Inlet opens immediately afterwards. Ignition platinum points open with piston dead on top of compression stroke, lever two-thirds retarded. I have lowered compression by inserting cardboard washer (1/16in.) between cylinder and crank case.—M.J.J.

The adjustments and timing of your engine appear to be quite in order. We are therefore inclined to think that the engine needs decarbonising, probably the valves require grinding, and, further, it may be that the sparking plug is unsuitable for the engine. Try a plug having stouter electrodes, as the knocking may be caused by the plug points being overheated and incandescent after a certain amount of running.

Converting Single-speed Rudge.

I have a 3½ h.p. Rudge motor cycle, single gear, clutch, which I want to convert into a sidecar mount. (1.) What change-gear apparatus can I have fitted, and what firms can supply this? (2.) I have been advised that variable pulley gears are unduly severe on belts. Is that information correct? (3.) Any further advice *re* above not included in my questions will be appreciated.—J.F.W.

If your clutch is the Rudge engine-lift clutch, you might possibly obtain an Albion countershaft gear for chain or belt drive—the makers of which, Messrs. The Albion Engineering Co., Ltd., Upper Highgate Street, Birmingham, had a special model for free engine sidge machines. (2.) Expanding pulley gears are harsh on belts if used improperly, *e.g.*, by making rapid and extreme gear changes when running the engine "all-out." The correct method of changing is to work the gear lever notch by notch according to the road and engine speeds, when the belt wear will be quite normal. (3.) Your engine-shaft clutch precludes the adaptation of an engine-shaft gear, and the multi-gear would require structural alterations to frame and engine. If the Albion gear set is unobtainable, you would be well advised to sell your present machine and purchase one designed for sidecar work.

Choosing a Lightweight.

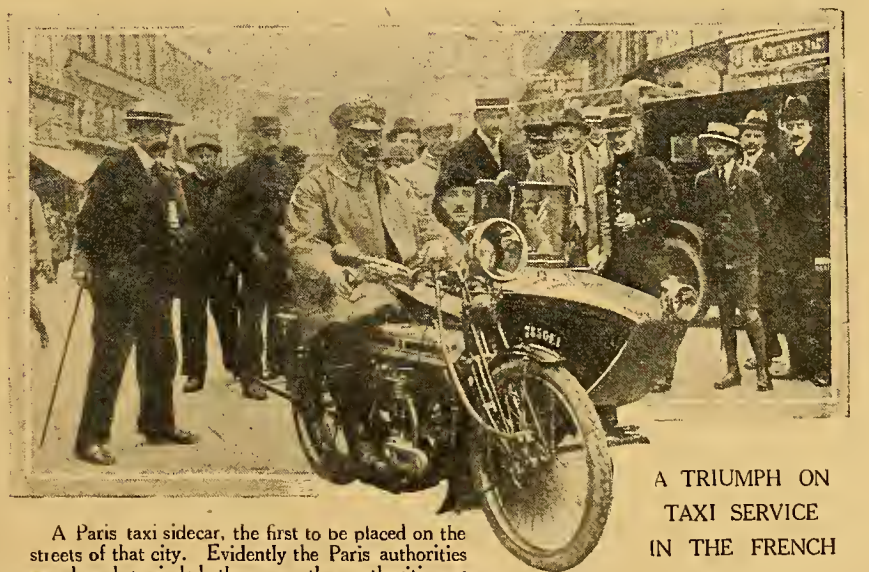
I hope to purchase a lightweight motor cycle when the prices go down, probably a second-hand one. (1.) Do you advise a four-stroke or a two-stroke? I should not be able to give more than about £40 to £45. I saw a letter in *The Motor Cycle* a week or so ago putting forth the merits and demerits of two and four-strokes, but am rather prejudiced in my opinion, having only ridden four-strokes. (2.) Is the petroil system on a two-stroke a serious drawback? (3.) Surely, if a petroil mixture is correct for level roads, when going up hill the engine requires more oil, and such a mixture would allow it to overheat? (4.) Is it a fact or merely an imagination that the prices of second-hand motor cycles are going down? (5.) Will the price of new as well as second-hand motor cycles go down when the American machines come in after November?—R.H.H.

(1.) Perhaps the general standard of four-stroke lightweights is higher, since they are mostly higher in price, but you would certainly have no cause for complaint in any of the better class two-strokes. (2.) The petroil system is declining in favour, but is by no means a drawback as you suggest. (3.) When ascending a hill you are correct in supposing that the engine requires a greater quantity of oil, but as the oil is supplied in proportion to the petrol consumed the larger throttle opening necessitated in hill-climbing allows for this proportionate increase. (4.) There appears to be a slight downward tendency in the price of second-hand machines at the present time. The American imports, when available, will probably be insufficient seriously to affect the prices.

Magneto for Lighting.

I have a Bosch magneto marked type 32. It is just the size of an ordinary motor cycle magneto. (1.) Can you tell me whether it is a high or low-tension? (2.) Were there ever any Bosch high-tension magnetos made without a contact-breaker? (3.) If it is low-tension, could it be used for lighting purposes?—A.L.

(1.) Your magneto is probably of the low-tension variety. (2.) We do not think that any Bosch high-tension magnetos were made without contact-breakers. (3.) It could no doubt be used for lighting purposes, but, if you wish to use four-volt bulbs, it will be necessary for you to have a choking coil in the system. You could obtain a lighting set to run from a high-tension magneto from F.R.S. Lamps, Pershore St., B'ham.



A Paris taxi sidecar, the first to be placed on the streets of that city. Evidently the Paris authorities are broader-minded than are the authorities at Edinburgh, where permission for sidecars to ply for hire was recently refused.

A TRIUMPH ON TAXI SERVICE IN THE FRENCH CAPITAL

Hub Gears.

I have recently purchased a B.S.A. two-speed and free engine hub gear (I believe it is a 1913 model), and although it gives top gear and free engine quite well the low gear clutch slips badly when the low gear is engaged. How can I adjust this clutch? The clutch consists of a steel cone acting against a phosphor-bronze one, which is very thick, presumably to allow for wear. As the phosphor-bronze cone is still about $\frac{3}{16}$in. thick, I do not think that it can be badly worn, especially as the rest of the gear is in excellent condition.—H.V.P.

The adjustment of the low gear clutch in the B.S.A. two-speed hub is effected by tightening the adjusting screw in the centre of the quick thread lever on the near side of the axle. If the push-rod in the axle is worn, of course it may require renewing, and also it may be necessary slightly to shorten the pedal control rod.

Drip Feed Lubricator.

My 1916 B.S.A. was recently decarbonised. Now, when running, oil accumulates in the drip feed glass at speeds over 15 m.p.h. As the compression was poor, I thought the gas was getting by the rings and blowing the oil back. New piston rings were fitted, and when run in compression was excellent. Oil, however, still accumulates in the sight glass, and does not get to the engine at speeds over 15 m.p.h. There is no stoppage in the pipe, as oil runs through freely to the crank case when the engine is not running. Can you suggest a cause?—C.R.T.

We think the trouble lies in the drip feed lubricator of your machine. Immediately behind the oil pump plunger you will find a small set-screw. On removing this you will find a small ball and spring. This is a vacuum valve, and should be quite clear and free from grit, etc.; also, beneath the drip feed body itself is another non-return valve, operated by a small pen steel disc. See that this is clean also; and, if your trouble still continues, try the effect of replacing this latter disc with a small steel ball.

Question of Taxation.

I should be glad if you could advise me in the following case. I paid £1 Revenue tax on No. 1 machine in February. No. 1 broke down and I could not get renewals, so I purchased and use a second machine. The Revenue people say I have failed to pay the tax on No. 2 and will probably summon me, while I maintain the tax already paid when No. 1 was running will suffice.—T.S.

Unless you used No. 1 machine after purchasing No. 2 you are not liable for a licence, though attempts are sometimes made to exact double payment. We should advise you to join the A.C.U., or the A.A. and obtain its help.

Spark Timing.

I have had occasion to take down my 6 h.p. N.S.U. twin and do not know how to retime it. The wheels are clearly marked for time of valves but not for spark. The magneto gear wheel is fitted on a chamfered or taper shaft without any key, and held on by a nut. Will you please let me know the way to do this?—H.M.O.

(1.) The spark timing is as follows: Set ignition control two-thirds retard, revolve the engine until piston is at the top of the compression stroke, set the contact-breaker so that the points are just breaking, and connect the magneto drive, taking care that none of the parts move from their positions. The magneto gear wheel is fitted on a taper shaft, and is not usually held by a key.

READERS' REPLIES.

Petroil on Scotts.

In a recent issue I noticed a correspondent, "Scottite," Eltham, asking for information *re* petroil system on a Scott machine. I have owned several Scott machines, and have often had some difficulty in oiling, owing to the very small outlet nipples becoming choked with fluff, cork, etc. On my last machine I discarded the oiling system and relied entirely on petroil, which gave absolute satisfaction in every way. Proportion of oil used, threequarters of a pint to a tank full of petrol.—CHAS HARBY.

Start of the first run of the Cambridge University Motor Cycle Club, which has recently been reformed. Judging from the enthusiasm shown by members, the club has every prospect of growing into a successful and important body.

Magneto Mystery.

Perhaps my remedy of a similar tro may be of service to "E.T.P." period of maximum density occurred of the limits of travel of the cam ring moved the cam on its ring to embrace period. This had the desired effect. G. SPEAKMAN.

With reference to the above ques by "E.T.P.," I had similar trouble a stationary unit. I found the caus be a breakdown on the insulation in armature, by testing with a Bri Meggis. The reasons for the mag sparking correctly on the bench, I th are: (1.) Firing under ordinary at pheric pressure. (2.) The earth re from the plug to the magneto practi becomes an insulated return, hence spark. When the magneto is refitte the engine, the frame is an easier for the current than the spark gap, I think, to the above-mentioned br down.—H. E. SINGLETON.

In attempting to solve a similar culty quite recently, I found that magneto was unconsciously held by contact breaker cover whilst turning armature by hand. On the engine t was no such support, and the cam ri fitted with arm for variable ignitio had worn so slack that it dropped so what and thus allowed too much varia in the opening and closing of the plati points. A new cam ring was the cur F.G.L.E.

Seats on Scooters.

THE success of a seat type scooter in a recent lightweight trial in the Midlands should give designers of such vehicles matter for serious thought. The course was over forty miles of indifferent roads, and included several test hills and a water-splash; and it is obvious that it would be almost a physical impossibility for a competitor standing on a platform to cover the course. This will be appreciated by anyone who has attempted more than a few miles in a standing position. Clearly then the seated scooter is in a different class from the stand-up type, and has a wider range of action.

In effect the scooter with a comfortable pan seat is nothing more than a miniature motor bicycle, and only limited in its range of action by the absence of a change-speed gear. The machine which won the short distance event in the Midlands was, of course, geared extremely low—approximately 16 to 1—and averaged 13⅓ miles per hour.

Manufacturers and Competitions.

AS announced in last week's issue, the "trade" has decided to support twelve competitions during August, September, October, and November. This decision, coming as it did immediately following a resolution which was responsible for the withdrawal of trade entrants in the Scottish Trials and the abandonment of many open competitions, no doubt will cause several club committees to rearrange their programmes. The reversal of opinion concerning trials may have caused some surprise, but it appears that, although the manufacturers will experience considerable inconvenience, they realise that the motor cycle organisations are desirous of trade support, and have decided to accord support to no less than twelve open events before November 30th. The decision is wise—albeit rather overdone—for, to withhold support from important events encourages the pseudo-private rider, which is very undesirable: at least from the trade point of view, since it leaves the way open for the more "enterprising" of the makers unofficially to participate in any trials that they may desire, and so obtain an advantage over their contemporaries, who may adhere strictly to the ruling of the Union.

Incidentally, the concession acknowledges the value of trials at the present time, and is a practical recognition of the good work of the clubs in the past in helping to develop the motor cycle to its present reliable stage.

Unrestricted Lighting.

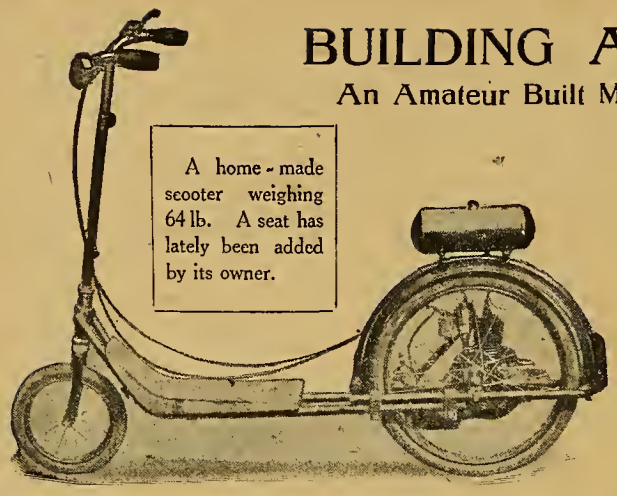
THERE is now in print a Home Office Order published revoking the vehicle lighting Orders issued during the war. At first sight it may seem that this is good news for motorists; head lamps may be of unrestricted size, any strength of light may be employed, and it would appear that everything is to be restored as it was in the good old days before the war. If, however, a little thought is given to the matter, it will be seen that motorists will have to put up with the insufficient lighting of bicycles and horse-drawn vehicles which caused many accidents in pre-war days. Now pedal cyclists are once more to be allowed to be the most unfettered user of the highway, and to ride an almost invisible machine by night with no rear lamp, and the same remarks apply to the user of the horse-drawn vehicle.

There is yet another objection, and that is that the new Order will withdraw the necessity for using a lamp on the sidecar to show the full width of the outfit, and if this is done it involves another hardship on the careful road user, who may find himself responsible for an accident which, if the said lighting regulations had been in force, would never have happened. We can only hope that in the near future legislation covering the whole question will be revised, and that the present reversion to pre-war conditions will be of short duration.

An Index to the advertisements in this issue will be found on the page facing the back cover.

BUILDING A MOTOR SCOOTER.

An Amateur Built Machine and How it was Constructed.



A home-made scooter weighing 64 lb. A seat has lately been added by its owner.

"THE Hawk" came into being when a motor cycle burnt up under me. After four years' daily experience with all types of cars, I got delivery of a little 2¾ solo bicycle of my own; it was good while it lasted, but after three weeks ownership it caught fire and was totally destroyed. The 2¾ had been used chiefly for short runs, shopping, business calls, etc., and was almost essential for my work. A new one was altogether out of the question. I thought it over for a long time, then sold the wreckage, and as the problem of building a motor cycle was beyond me, I started the scooter.

I carried out experiments on various details, and, unheeding the advice of friends, eventually designed "The Hawk." It has been an unqualified success. Scooting is one of the easiest things in the world to learn. The motor starts after a single push with the foot; the maximum speed reached on the level is 25 m.p.h., while in hill-climbing it is excellent. With its gear ratio of 8 to 1 steep hills may be easily negotiated.

The Frame.

No special apparatus is needed by the amateur, as the frame is of the very simplest construction. It is constructed of two 3ft. lengths of ordinary ⅞in. steel cycle tubing running from the forging at the fork head to the motor unit.

Bending the front end is not very difficult work. It was found that by heating the tube until practically white-hot, it could be easily brought to shape. It was not filled with sand, and no wrinkles occurred. First of all the length of tube was marked with chalk at the place where it was intended to be bent. It is a good plan to insert a cork into the end that is placed in the fire. This prevents the air circulating inside. Then, having heated the tube, water was carefully poured over the red metal until only about three inches remained red-hot at the place where it was to be bent. By applying a gentle pressure on the ends, the bend was made quite easily.

The collar which holds the steering-pillar and forks is an ordinary cycle head piece, which may be obtained for a few pence at almost any second-hand cycle shop. It is advisable to obtain a collar without the cycle lugs fitted, as, of course, these are quite unsuitable for use on a scooter. The forks are those used on an ordinary bicycle cut down with a hack saw to suit the size of the front wheel. At the top and bottom of the fork spindle or steering-pillar, ball races are fitted to take the weight off the steering. These thrust races, forks, and collar, can all be bought ready to fit, being standard bicycle fittings. The handle-bars are joined to the fork spindle by a length of ⅞in. tubing. This passes into the spindle, and is pegged in two places with ¼in. iron pegs put in through the two tubes at right angles, the ends of the pegs being filled quite flush on the outside. At the handle-bar end the joining tube goes over the handle-bar tube, and is clipped tightly by a steel band clip.

A forging, or lug, which holds the two main tubes to the collar, may have to be specially made, as it is a job far beyond most amateurs, but probably Messrs. Chater-Lea or the Metropolitan Machinists could supply.

The front wheel is of the type used on bath-chairs, having a 13 × 2¼in. tyre. It runs on two ball bearings. The whole spindle, ball bearings, and nut may be purchased ready to fit.

The back wheel is part of the Auto-wheel unit. It has a 20 × 1¾in. tyre.

The Engine.

This unit is simply an Auto-wheel, purchased second hand, and with a little adjustment it has given every satisfaction. Recently a man weighing 12 stone ran 215 miles on this scooter in one week, and no repairs of any sort were needed. 110 m.p.g. is the petrol consumption; and one filling of oil is sufficient for eighty miles. To clip the Auto-wheel to the frame four steel bands were made of 1½in. × ⅛in. sheet. These clips are just strips of steel bent up and bolted at the two ends. The tubes of the frame pass under the tubes of the Auto-wheel, and the clips go round both.

Details.

The footboard was sawn out of strong birch, 11in. wide. It is shaped to the tubes, as is shown in the illustration, and has the effect of taking all "whip" out of the frame; bolts and clips hold it in place. The top is covered with rubber sheet.

Having settled to my own satisfaction the vexed question, "To sit or not to sit?" I set about designing a seat, which, subsequent to the accompanying photograph being taken, has been fitted with great success. A brake has also been added, and is worked by a pedal on the footboard. It is, however, rarely necessary to use this brake, as the compression of the engine is generally sufficient. A larger wheel at the front is now fitted.

The total weight of the machine is 64 lb. loaded with petrol and oil. It can easily be carried about, and is quite simple to handle. The total length is only 4ft. 9in. The placing of the engine on one side has no ill-effect on the balance when running, and anyone can mount the scooter and ride it perfectly in a few minutes. It will be seen that the whole is quite simple and cheap to construct, and is well within the powers of an amateur.

J. F. LEEMING.

Why Not Standardised Controls?

I THOUGHT I was too old a bird to be caught napping by the throttle lever which opens in an unaccustomed direction. Indeed, in pre-war days I rather scoffed at a mild clamour in favour of standardised controls which was raised in this journal. I am wiser now. In those days, like most motor cycling journalists, I rode two or three different machines in the course of a week, and my ganglia never lulled themselves into the false belief that all handlebar throttles open clockwise. During the war I have perforce been loyal to a single mount for 99% of my riding, and I can now view the matter from the standpoint of the "one mount" man. I took delivery of a 1919 machine last week, and its throttle opened anticlockwise. In the first petty emergency—a mildish corner following upon the sort of hill on which one tries to break the speedometer—I opened the throttle to the very limit when I meant to shut it dead. Graceful parabola over the handle-bars. Abraded hips, elbows, knuckles, ears. Footrests indicating five and seven o'clock. Front number plate trying a side-loop. Front mudguard mistaking its functions and acting as a spoon brake. Oaths. Blood. Sticking plaster. Finally—these ripe reflections!

Chaos Supreme.

I SUPPOSE the throttle is the only control which should be standardised in the interests of safety, but several others might be considered with an eye to convenience. Car owners will stand no nonsense in the location of those controls on which safety depends: if a firm produced a car with the clutch pedal on the right and the brake pedal on the left, the innovation would not do it a bit of good. Ford is the only car designer who is allowed to be a law to himself in such matters, and he has only acquired freedom by appealing to the public with the cheapness of his car. But motor cyclists meekly take whatever the trade hands out to them. So I find that on one of my machines the brake is on the left, the clutch on the right: I buy a new machine, and the pedals are reversed. So when I want to make a lightning dab change up from third to fourth at high speed, I stamp on my foot brake and slam my gear lever over, or commit some such pardonable but disastrous *bêtise*. When I take over a new machine, I may not be able to tell which way the spark advances without uncovering the contact breaker, or describing airy circles with my forefinger to work out the direction in which the magneto sprocket runs. A little latitude in gear changing "gates" and quadrants is comparatively pardonable. But it is high time that brake and throttle controls were standardised as thoroughly as trade organisation permits.

The A.C.U. Six Days.

I DO not know whether I am suffering at all, but I am immensely tickled at the A.C.U. regulations in respect of the weight of machines entered for its September trial. It carefully specifies minimum weights, and sets them at impossible limits. A 250 c.c. solo mount is not to weigh less than 88 lb., for example, nor a 3½ h.p. solo less than 132 lb. Shades of John Bunney! These weights might have been doubled without much danger of enthusiastic makers getting inside them. Surely the A.C.U. bigwigs are aware that the trade dare not enter featherweight aluminium "specials," for the simple reason that the usual A.C.U. *olla podrida* of rough going, and a 20 m.p.h. schedule inclusive of tyre repairs, compels every entrant to be sturdy to a degree. On the other hand, no maximum weights are specified. Now, I am in a position to enter two machines rated at the same nominal horse-power, and scaling respectively 200 lb. and 320 lb. If they should encounter equal luck, and reproduce their normal behaviour, both should put up identical performances to within a mark or two. But the weight policy adopted by the Union would apparently fail to credit the 1919 model with the hundredweight reduction which it shows upon the 1914 model. The omission to inflict any penalty for dirtiness not ascribable to the roads is equally obvious in the rules. Is it too late to list penalties for leaky crank cases, tappet guides, gear boxes, etc.?

Relative Values.

THE A.C.U. scale of penalties could not be expected to evoke universal approval in a sport wherein every participant is more or less of a faddist. None the less it merits consideration. The Union ranks the merits or demerits of a motor cycle as follows:

	Marks.
PRIMARY.	
Reliability	50
Finishing condition	50
SECONDARY.	
Silence	10
TERTIARY.	
Acceleration	20
Maintenance of tune	20
QUAT—something (I forget my Latin).	
Brakes	10
Mudguards	10

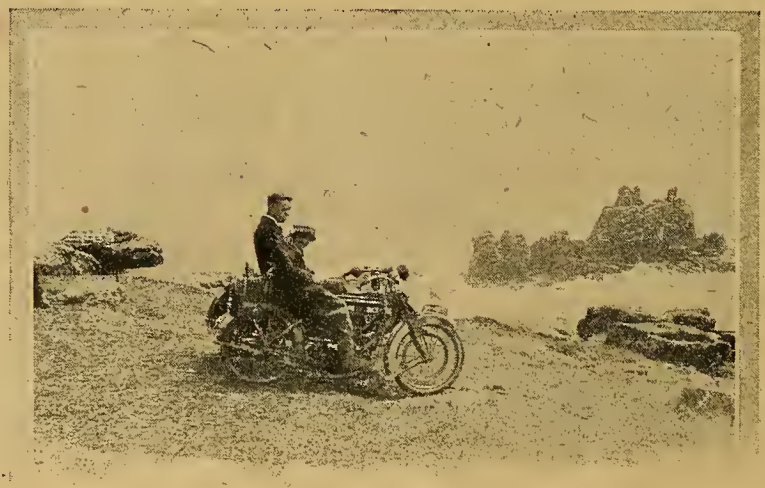
I remarked in the last paragraph that the average owner would rank low weight and mechanical cleanliness at least as high as some of the official desiderata (*e.g.*, silence and mudguarding). The few men who are familiar with good spring frames will note with quiet amusement that the super-primary question of

Occasional Comments.—

comfort is entirely ignored: perhaps for trade reasons, perhaps because of the equally practical difficulty of devising a simple comparative test of two rival springing systems. Apart from omissions, there are some astounding points in the selected awards. That silence should be graded as equal to brake power and maintenance of tune is obviously a sop thrown to the non-motoring public. Noise is a controversial question, and I admit that the A.C.U. has a strong case, though I disagree with it. I wonder if its audiometer will distinguish between mechanical noise and exhaust noise? Is not the best ideal a machine which is (*a*) mechanically silent, and (*b*) has a controllable silencer, capable of great silence on demand and of a reasonable noise when required? Acceleration interests the sportsman and the engineer, but five riders out of ten care nothing about it. It will be very difficult to estimate the worth of *standard* mudguards to a mark or two, and I do not envy the judges this part of their job. In the meantime it is excellent to see that a single tyre stop at an awkward moment, or a sooted plug, will not rob a good machine of its gold medal. The trial will be very strenuous, and for a variety of reasons it will completely fail to identify some of the fundamental differences between an absolutely first-class machine and a machine which is crude and rough, but sturdy and reliable.

That Empty Toolbag.

THE list price of a medium-powered 1919 machine is as near £100 as no matter. This figure does not usually include affixing numbers, a hooter, a pair of lamps, or a speedometer. For these omissions there are plausible excuses, *e.g.*, that such equipment costs anything up to £10, and many prefer their own selection. But my gorge rises at the toolbags. One is full, the other empty. The full bag contains a tool kit. In a few cases it contains a "designed" tool roll, fitted with cute little gadgets for all the tricky jobs which every machine sooner or later presents—*e.g.*, a thin open-ended spanner for the front wheel cones, a pair of duplicate spanners for tappet adjustments, a pair of miniature spanners for the Bowden adjusters, a valve spring remover, and other delights. In the majority of cases the tool roll is planned by a Sheffield toolmaker who has never seen the machine in question, has possibly never ridden a motor cycle of any kind, and generally drives a Rolls-Royce. The bag contains (I quote from a sample on my desk) a 6in. wrench (second-class quality), a tube spanner (which fits nothing but the rear spindle nuts), a screwdriver (too large for the magneto screws and too weak for other service), a pair of pliers (too clumsy for extracting split pins and not likely to be required for anything else), and a valve cap wrench. The latter is the only weapon of real value, except the magneto spanner, which is a free gift from another firm. I turn with beating heart to investigate the remaining tool pannier. What will it contain? I dream. Doubtless a handbook on management. A tyre repair kit. Some spare chain bits. A sparking plug in an armour-plated casing. Spare valves, suitably protected. Spare valve springs, ready compressed for immediate fitting when required. A few screws, bolts and nuts. I open the pannier. A vacuum. Nature abhors a vacuum, and I am a natural man. But I had forgotten. The machine only cost £100!



THE MOST WESTERLY POINT OF ENGLAND.

A B.S.A. sidecar in a region noted for its fine coastal scenery. The motor cycle has never been more fully appreciated than it has in the days of strikes, the most beautiful districts—often difficult of access by rail even in normal times—being open to devotees without any transport worry.

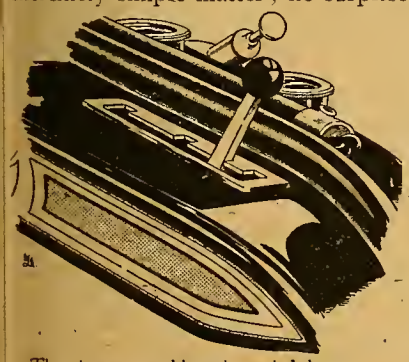
Why Keep the Push-cycle Saddle?

"OWEN JOHN," the famous *Autocar causeur*, aims some winged words at us motor cyclists and our peculiarities in the issue of that journal for June 14th; and amongst other humorous impertinences he wants to know why we continue to sit on push-cycle pattern saddles when we have almost universally discarded the pedalling gear for which those abominations were originally invented. I imagine "Owen John" is not a motor cyclist, or he would know better. To my mind, the push-cycle saddle is one of the most miraculous inventions in history. Hard, tiny, and all but springless though it be, it will carry a pedallist in comfort for a hundred miles or so per diem, with his leg muscles using it as a combination between a fulcrum and a bearing all day long. In its larger and more padded form, as applied to motor bicycles, it supports us in comparative idleness for as much as four hundred miles in a day; and I have yet to find a "pan seat" or driving chair to beat it on the rigid frames. The one-point suspension afforded by the super push-cycle type of saddle is almost ideal. I even go so far as to tell "Owen John" that the weight-carrying portions of my anatomy are usually far less weary after three hundred miles on a motor cycle saddle than after a similar distance in a very luxurious car. If one has got to be bumped, one may as well oscillate on a kind of hook: such a swaying motion is at least immune from rude shocks. But even the perfectly sprung frame will rightly retain the familiar saddle for some time to come. "Owen John" cannot know how little one "feels" a well-designed saddle on a sunset to sunrise jaunt.

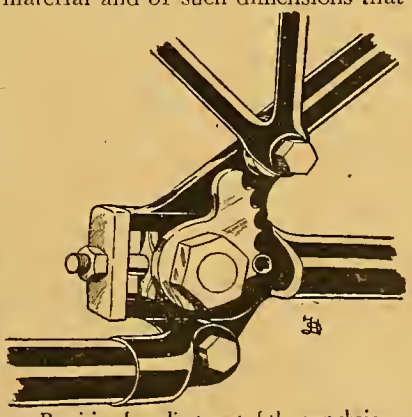
The Twin Rover on the Road

A Test of the 5-6 h.p. Model on the Edge Hills.

SOME motor cycles are so well and conveniently arranged in the matter of their controls that one may mount them and at once ride away with a feeling of familiarity. Such a mount is the Rover, the latest twin-cylinder specimen of which we lately had the pleasure of testing on the road. The 5-6 h.p. twin Rover-Jap is a wartime creation—it was originally produced to satisfy war demands, and right well it acquitted itself. Now that examples of the machine are available for private riders, it is, perhaps, not surprising, in view of the times in which we live, to learn that the order list is extremely lengthy. The machine to which we refer possesses no claim to novelty or even originality; it is the embodiment of well tried practice in motor cycle design, and to many makes a particularly strong appeal on that account. We tested the Rover with the standard sidecar attachment and a ten stone passenger. From the first starting was an extremely simple matter; no surprise in that, perhaps, for we had already learned to respect the care with which Rover products are examined and tested before issue from the works. Away we went through Warwick and Barford to our favourite testing ground—the Edge Hill range. Keeping up a lively pace through Kineton straight to the foot of Edge, we at once opened out and swept round the bend at a crackling pace. The second gear of 9 to 1 sufficed until well round the second bend, when a drop to low (17 to 1) was necessary on the 1 in 6 stretch. But on this ratio the engine naturally raced away and had to be throttled down; it was abundantly clear that with a slightly lower ratio for the middle gear, the lowest gear would never have been requisitioned. A second ascent confirmed this opinion. Observant readers well know that a favourite test of ours is stopping and restarting in the middle of a steep hill. It brings to light many things—good or bad—about a motor cycle. First, the brakes have to be first rate to hold the machine on the gradient; secondly, the engine must be properly adjusted and controllable; and thirdly, the clutch must be of such a material and of such dimensions that it is well capable of starting the not inconsiderable sidecar load on a single figure gradient. This new 1919 Rover answered everyone of those requirements; we repeated the operation three times "just to make sure," and on each occasion the machine performed consistently well.



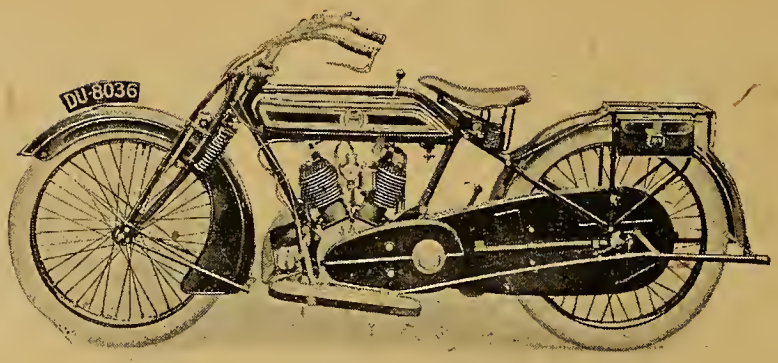
The change speed lever is carried through the tank, leaving the sides quite smooth Glass-topped filler taps are used.



Provision for adjustment of the rear chain on the Rover is by the draw bolts and serrated washers shown.

The Twin Rover.—

Double purpose twins are not as numerous as they might be. Manufacturers who favour sidecar attachments seem gradually to drift toward an 8 h.p. mount of a luxurious type fitted only for passenger work. In the case of a twin of the Rover type—whose J.A.P. engine of 70 × 85 mm. bore and stroke has a capacity of 654 c.c.—the machine is highly suitable and equally attractive to many as a solo or sidecar machine, for it is of medium weight as chain-driven three-speeders go, and consequently not a burden to handle. Smoothness of running is one of its virtues, and the silent running J.A.P. largely contributed to this happy state of affairs, for its valve gear was noticeably quiet. The gear box is exceptionally sturdy and apparently well up to its work, whilst the chain cases are a sound job and devoid of rattle. Our trip was purely a run of pleasure, for no untoward incident occurred, the Rover responding to every call. Toward the conclusion of the run one noticed a scraping sound when bounding over the pot-holes due to the new chain having stretched and fouling the casing. This experience only served to bring home the handiness of the special chain adjustment provided, which soon set matters right. The device, which deserves to be better known, is illustrated. First the spindle nuts are loosened and then the draw bolts used to tension the chain correctly. The serrated washers are then placed in corresponding positions on the pegs on each side of the fork end to ensure the wheel remaining central with the frame, thus taking all strain off the chain adjusters themselves.



The 5 h.p. twin Rover, the engine of which is 70 x 85 mm. (654 c.c.). The clean and workmanlike design of this model at once commends itself both to the sidecarist and solo rider.

An Exhaustive Benzole Test.

A Long-distance Trial arranged by the Automobile Association to ascertain the Effects of Benzole on the Engine.

EVEN at the present stage of automobile history there are innumerable people who do not consider benzole to be a suitable fuel for their machines. Many are so filled with doubts and fears for the mechanical condition of their engines that they steadfastly refuse to give the home-produced spirit a trial, despite the assurances of those of us who have used it for many years before war conditions gave it greater prominence as an alternative source of motive power.

Although it has become generally known that good quality benzole, such as that conforming to the specification of the National Benzole Association, has no deleterious effect on the engine, either as regards excessive wear on the bearings or corrosion of working or other surfaces with which it comes into contact, this freedom from attendant mechanical disadvantages accruing from its use has yet to be proved by thoroughly exhaustive and authoritative tests carried out by someone who has the motorist's, rather than the producer's, interests at heart.

An Unbiassed Trial.

Such a demonstration will be undertaken in the near future by the Automobile Association as a result of suggestions lately put forward in *The Autocar*, and, though primarily of interest to car owners, it will likewise provide material of much practical value to all users of internal combustion engines.

Briefly, the trials will be arranged on the following lines, the preliminary arrangements having been planned in conjunction with various suggestions emanating from the editorial staff of *The Autocar*. A new five-seated touring car of some popular make will be selected, and after it has been tuned up on petrol, the engine will be entirely dismantled and cleaned, after which a very thorough examination of all wearing parts will be made, the condition of all surfaces noted, and all bearing, sliding, and tappet clearances carefully recorded. After reassembling, the car will be used over all classes of roads on a tour extending to about ten thousand miles.

Observations to be Tabulated.

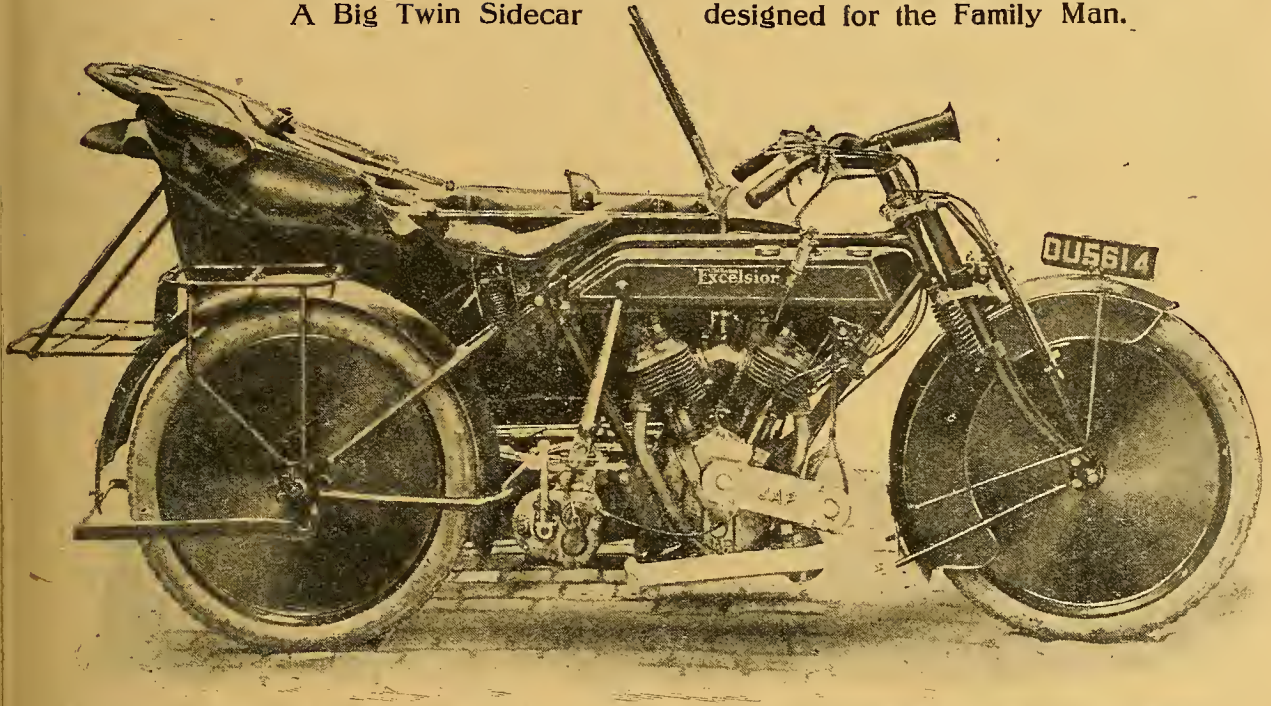
During the tour every observation will be made to enable a minute report to be given on the performance and consistency of running, average consumption, and deterioration of lubricating oil. Afterwards, the engine will be again taken down, and comparative measurements and observations made, also any adverse effects on carburetter, tank, or connections will be noted.

If at all possible, it is intended to include bench tests, and in every way to compile complete data with the idea of disposing of all debatable points attending the use of benzole. We regret that the experiment does not deal also with the motor cycle; still, the final observations will be of interest to all motor users.

Certainly the result of this trial will be looked for with keen anticipation by all who are interested in furthering the use of benzole, either from the standpoint of those connected with the industry or purely from the natural desire for the complete development of our national assets.

THE 1920 8 H.P. BRITISH EXCELSIOR.

A Big Twin Sidecar designed for the Family Man.

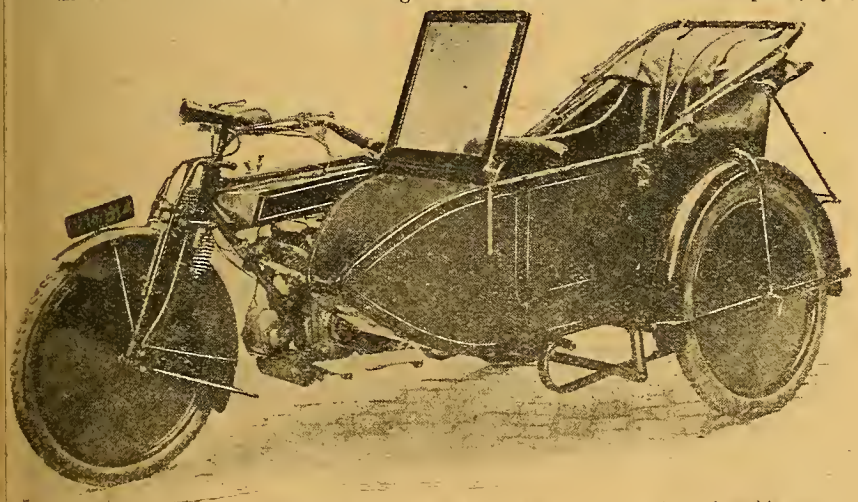


The new twin British Excelsior is fitted with an 8 h.p. J.A.P. 85·5 × 85 mm. engine, Sturmey-Archer gear box, and all-chain transmission

DESIGNED as a family sidecar, the new 8 h.p. British Excelsior is one which will appeal to many motor cyclists who have found the average medium-powered machine too small for their requirements. While there is nothing in the machine which departs from the conventional, the new model strikes one as being a "clean" design, in which accessibility has been well considered. Provision is made for fitting a dynamo between the "seat" tube and the rear mudguard, and the gear box bracket is upswept in order that the ground clearance shall be suitable for Overseas requirements. This is no less than 6in. at the lowest point, yet, with the 28 × 3in. tyres, the power and gear units do not appear to be unduly high.

The engine is the 8 h.p. J.A.P. provided with B. and B. pilot jet carburetter and M-L magneto, and driving through a Sturmey-Archer gear box by chains throughout. The cylinders are readily detachable without disturbing the rest of the engine, and well-made and easily removable cases enclose the chains.

Included in the general equipment of the cycle portion of the outfit are Druid Mark II. forks, aluminium footboards, front and rear stands, American type rims, and detachable wheels. Although not shown in the illustrations, it is intended that the sidecar lugs shall be integral with the frame.



The Excelsior sidecar is designed to accommodate a juvenile on a sliding adjustable seat

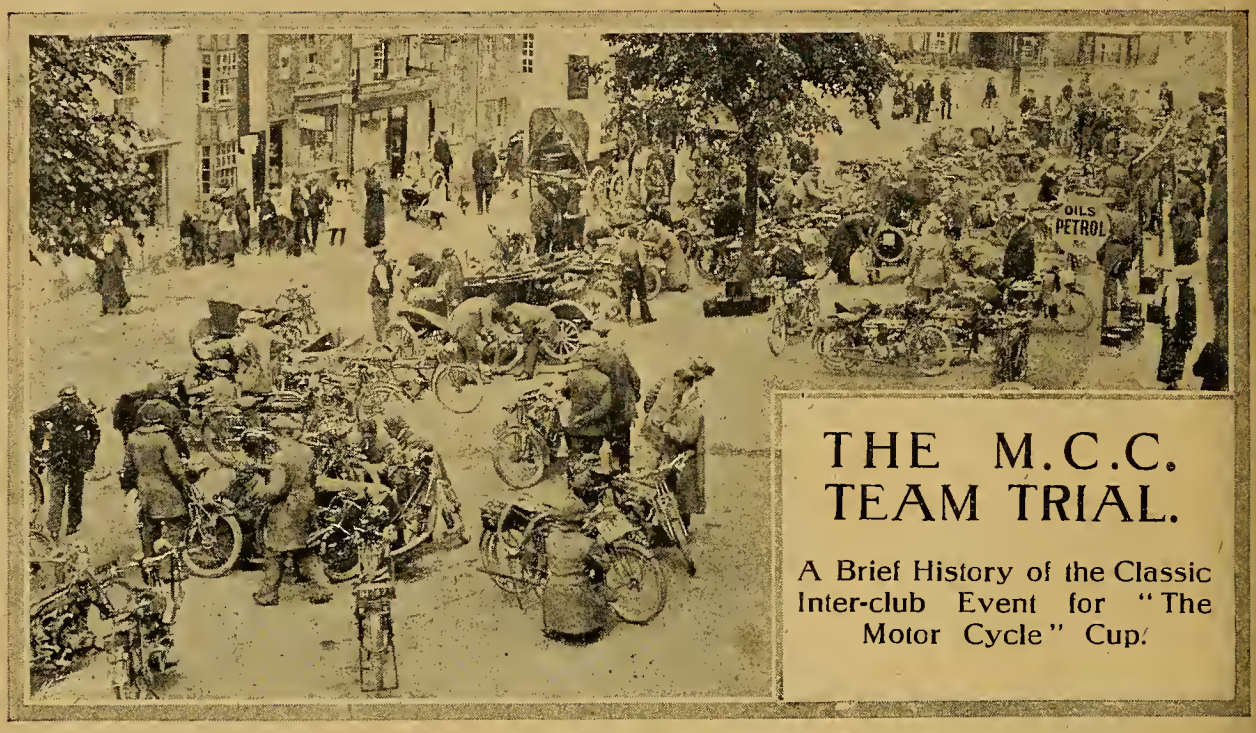
The Sidecar.

Appreciating the requirements of the average user of big twin sidecars, the makers of the British Excelsior are standardising an extra large sidecar body which, when desired, will be supplied with an adjustable seat for a juvenile. This seat slides on two-slotted metal guides fixed to the side and the door of the body.

The price of the machine with sidecar is £150, or, with hood screen and additional seat, £162. A dynamo lighting set with electric horn costs a further £25, while a spare wheel with tyre is catalogued at £8.

DAYLIGHT SAVING.

IN the House of Commons recently Mr. Shortt, the Home Secretary, replying to a question by Capt. R. Terrell about "summer time," said that latterly very few criticisms had reached the Home Office and it is believed that the general feeling is strongly in favour of the continuance of the system. If any further representations on the subject are submitted, they will, of course, receive careful consideration by the Government, but as at present advised there seems no occasion for a further enquiry. This is good news, and it is sincerely to be hoped that summer time will be continued from year to year, as the long summer evenings are greatly appreciated by those who take their pleasures awheel.



THE M.C.C. TEAM TRIAL.

A Brief History of the Classic Inter-club Event for "The Motor Cycle" Cup.

Some of the competitors in the 1913 team trials at Chipping Norton, where no less than forty-one teams assembled.

IN 1904 *The Motor Cycle*, then, and for over six years, the only journal devoted to the development of the machines now so popular, presented a fifty-guinea cup to the Motor Cycling Club for competition among teams representing clubs of Great Britain. From the start the competition was a great success, as was to be expected, since the winning of the trophy is regarded as an honour for the club securing it by the prowess of its chosen members against the picked riders of contemporary clubs.

The first team trial for the cup was held in August, 1904, and the conditions called for teams riding four solo and two passenger machines, the course being 100 miles of main roads between Bicester, Aynho, and Deddington, Oxon.

In referring to the course, the Rev. B. H. Davies, in *The Motor Cycle* for August 1st, 1904, says:

> "A twenty-five miles out and home course was originally fixed upon, to be covered twice. However, as in the team trials a checker to each mile will be necessary, since each rider is to score one mark for every mile covered without a stoppage, it became clear that a twelve and a half miles out and home course would be ample; even for this short stretch about a score of reliable marshals will be requisitioned."

The above will be read with amusement by present-day motor cyclists; but it illustrates the rapid progress made by motor cycle designers since these early days of only fifteen years ago.

The profile of this course, too, is interesting, and reveals that it included "hills" of 1 in 23, 1 in 12, 1 in 14, and 1 in 18.

Five teams competed, *i.e.*, the M.C.C., the Coventry M.C.C., the Guildford C. and M.C., the Peterborough and District M.C., and the Southern M.C. The first-mentioned team included such well-known riders as F. Hulbert (3½ Hulbert-Bramley with Minerva engine), now works manager of the Triumph Co., and W. H. Wells (2¾ Vindec), manager of the Hendee Co. in England. The Coventry club's team included R. W. Ayton, the original patentee of aluminium cylinders with liners, who rode a 2¾ Triumph, S. Wright (3½ Excelsior and trailer), and Bert Yates (3½ Humber tricar). The two last named have been connected with the Humber concern for many years. A. W. Wall, the inventor of the Roc gear and the Auto-wheel, drove a 3½ Roc and trailer in the Guildford team.

Most of the passenger machines were either trailers or tricars—only one sidecar being entered, while at least one of the trailers, S. Wright's Excelsior, had only a single-gear ratio, but to assist the engine as much as possible on the gradients an exhaust cut-out was fitted, and operated by a lanyard from the trailer seat.

The following were the results of the first event:

1.	Coventry M.C.C.	485 marks
2.	M.C.C.	381½ "
3.	Peterborough and District M.C. ..	245½ "
4.	Guildford C. and M.C.	187 "
5.	Southern M.C.	101½ "

In 1905 the competition was not held, the only team turning out being the M.C.C., who thus had a walk-over. In 1906, however, the M.C.C. won the trophy in competition against representative teams.

The Coventry club regained the cup in 1907 in the main road trial against the M.C.C., the Birmingham M.C.C., the Southern M.C., and the Great Yarmouth Club.

In 1908 the Coventry club won the event outright, and a new trophy was presented to the M.C.C. by *The Motor Cycle*.

In this event the majority of passenger machines (of which two were included in each team of six) were tricars or trailers, but three sidecars were entered, and showed up very favourably.

No fewer than seventeen clubs were represented in the 1909 event, and the majority of passenger machines were sidecars. The M.C.C. won this year with full marks (600), the second and third teams being respectively the Coventry and Warwickshire M.C. (578) and the Oxford M.C.C. (535).

Eighteen teams competed in the 1910 trial, and by this time the tricar had fallen out of favour, as each team included one sidecar. Again the Coventry club won, with 100% marks, but the Northampton club also secured full marks, and the award was made on time errors. The Bristol team, too, did well.

The eighth annual trial attracted twenty teams, of which the Derby and District M.C.C. had the least time error; but the following year (1912) there were twenty-five clubs competing, each team being made up of five solo riders and one sidecar. The event was won by the Nottingham and District M.C., the second and third teams being those representing the Bedford and South Birmingham clubs. Several of the clubs lost their chance of the premier award by the failure of their sidecar representatives to make a non-stop run; but, taken on the whole, the passenger machine did well compared with previous team trials.

The 1913 team trials attracted forty-one teams—the record entry, representing 246 competitors, 82 passengers, and over

The M.C.C. Team Trial.

100 reserve riders. The honour of winning this great event fell to the Sheffield and Hallamshire M.C.C. So representative of the whole of Great Britain was the trial that eleven teams travelled no fewer than two hundred miles to reach the start, which amply demonstrates the great interest in the event.

Only thirty-one clubs entered for the 1914 event. The teams were made up of four solo riders and two sidecar drivers. The course for this trial included two stiff hills, Tysoe and Sunrising, which were responsible for many stoppages. The event was won by the M.C.C. team.

For this year the composition of the teams has again been altered, and each competing club will be represented by three solo and three passenger machines, which shows that sidecars are now regarded as reliable as solo mounts.

The 1919 team trial will be held on September 6th, and clubs wishing to nominate a team should communicate at once with Mr. Southcomb May, 34, Gower Place, London, W.C.1.

THE UNIT SYSTEM.

A Designer's Suggestions for Single and Two-cylinder Engines with Gear Boxes Integral. A Simple Four-speed Gear Box Described.

THE unit system of construction—*i.e.*, the building of engine and gear box integral—has been almost an obsession with many designers for several years. In the drawing offices of most motor cycle manufacturers there are filed away the drawings of "engine gear" units which, for some unknown reason, have been "turned

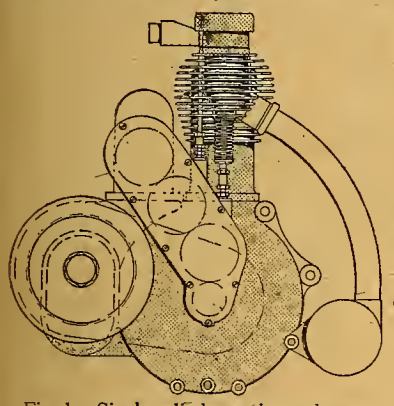


Fig. 1.—Single-cylinder engine and gear box designed as a single unit.

down" by the powers that be. True, a few machines embodying this feature have appeared on the market, notably the Diamond, Singer, Precision lightweight, and the Villiers four-stroke, but, excepting the first-named, the models now offered to the public do not include such machines.

Advantages are so apparent from both the riders' and the manufacturers' points of views that one is constrained to wonder why, in these days of advanced design, the unit system has not been more seriously adopted.

The Villiers unit was most successful, although the engine was only 74 × 80 mm. bore and stroke respectively. The first one made covered the distance between Wolverhampton and London at an average speed of 27 m.p.h., and was capable of 53 m.p.h., at which speed the revolutions of the engine were 3,400 r.p.m.

The weight of the engine and gear combined was practically the same as that of another engine and separate gear box; but as the flywheels were larger in the former, everything being equal, there would be a saving in weight by utilising the unit system.

Various Useful Types.

Fig. 1 shows a more or less conventional 3½ h.p. engine combined with a two or three-speed gear box. The latter is of the sliding gear type, driven by a silent chain from the mainshaft of the engine. Silent chains when working under ideal conditions do not need adjustments, and inside a gear box such conditions are obtained.

A twin engine of about 800 c.c. built integral with a four-speed gear box and intended for sidecar work is depicted in

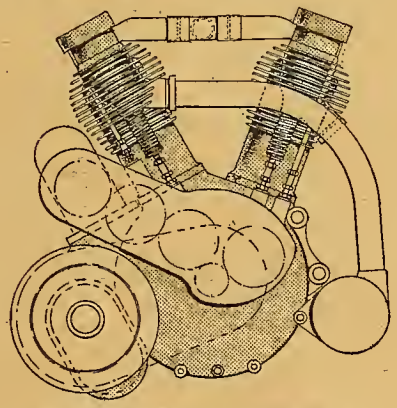

Fig. 2.—A compact unit consisting of a twin engine and gear box.

the second illustration. The gear box, which is shown in fig. 3, has sliding gears which are always in mesh. The plate clutch is outside the gear box proper, a desirable point, in view of the fact that such a clutch requires thin oil, which is not suitable for gears.

The mainshaft has the gear wheels A and D sliding on a splined portion. The wheels F and H are free to rotate upon

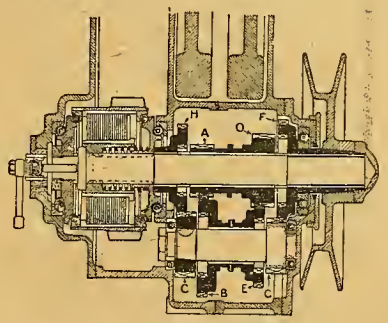

Fig. 3.—A simple four-speed gear box designed by the author.

the shaft, and the gear wheel F is fixed to the driving pulley member. On the secondary shaft, gears C and G are as part of the shaft, while B and E are idler wheels, both free to rotate separately on the shaft, but held laterally together by a forked operating lever.

To obtain the four speeds the following combinations are used, and operated by means of an ordinary gate change such as follows best car practice:

First speed.—B to left, A drives B, G drives F.

Second speed.—E to right, D drives E, G drives F.

Third speed.—A to left, H drives C, G drives F.

Fourth speed.—D to right, direct drive

STANMAR.

READERS' ROAD REPORTS.

WE have received the following road reports from one of our readers:

Kingston to Guildford.—Very good.

Farnham to Basingstoke.—Loose, rather rough.

Salisbury, Shaftesbury, Yeovil, Chard, Exeter, Okehampton, and Launceston.—Excellent.

St. Ives, Newquay, Padstow, Tintagel, Boscastle, Bude. Clovelly, Bideford, Westward Ho! Barnstaple, and Ilfracombe.—Excellent.

Bodmin, Redruth, Camborne, Penzance, and Land's End.—Good, but rough in parts.

The coast road from Ilfracombe to Combe Martin is closed owing to a landslip.

Porlock.—The private road is in a disgraceful condition, and positively dangerous. The notice at the top, stating that the road is "under repair," is wholly misleading: it appears to have had nothing whatever done to it in the way of repair.

Ilfracombe, Lynton, and Lynmouth.—Excellent.

Countisbury Hill is very loose and rough for the first three or four hundred yards; afterwards it is much better, but very rough.

Minehead, Taunton, Langport, Wincanton, and Mere.—Very good.

Mere to Amesbury.—Very loose and flinty.

Amesbury to Andover.—Rough.

The Andover-Salisbury route is much superior to the Andover-Amesbury road.

B3

THE KINGSBURY SCOOTER.

A Design Planned to Promote Cleanliness and Obviate Oil-slinging.

A seatless scooter, with two-stroke engine. Note the large silencer and manner in which the power unit is enclosed.

MESSRS. the Kingsbury Aviation Co., Kingsbury, London, N.W., propose, at no distant date, to place on the market a motor scooter of the original "stand up" type. A 2¼ h.p. two-stroke engine, carrying a detachable combustion head, is employed, while the cylinder and crank case form one casting. The crankshaft, carrying an external steel flywheel on the near side, runs in phosphor-bronze bearings, and a cast iron piston is at present employed, but may at a later date be replaced by an aluminium one fitted with cast iron rings. The weight of the power unit, less the C.A.V. magneto and standard Amac carburetter, is under 15 lb. The transmission gear employed is of a substantial nature, the drive being taken by a chain from the engine sprocket to a ball bearing countershaft situated directly in front of the rear wheel, and thence by another chain to the gear reducing sprocket enclosed in a case on the rear wheel. The gear ratio is 7 to 1.

A Chassis of Flat Steel.

The chassis is of flat steel throughout, the flexible qualities of which provide sufficient springing to absorb the smaller road shocks. On the top of the chassis a wide footboard is bolted, and is laterally held by means of long bolts, two of which hold the engine, which is situated directly behind the front wheel. Solid disc wheels are fitted, the front one being sprung by two vertically opposed compensating coil springs, the outer ends of which are attached to a steel frame, the lower half being bolted to the front forks, whilst the inner ends of the springs are attached, through a central slide, to the front hub spindle. Two brakes are provided—one hand and the other foot controlled—independently actuating the two external contracting brake bands on the rear wheel. A shield placed in the rear of the magneto, which is housed directly behind the engine, and extending from the wide footboard to the lower end of the petrol tank, adequately protects the rider, an especially important point to a lady. In addition to the gauze covering the off side of the engine, the petrol tank, conforming to the shape of the frame, practically encloses the complete engine unit. A substantial silencer is fitted and housed beneath the chassis.

The manufacturers of this scooter, who have previously been employed in the construction of aircraft engines, will be able to begin deliveries in large quantities within a short time.

R.A.C. SERVICE SCHEME.

Additional Benefits for A.C.U. Members.

EVER anxious to move with the times, the Royal Automobile Club recently inaugurated a new peace-time service scheme, which will directly benefit motor cyclists who are members of the Auto Cycle Union.

This venture will generally co-ordinate and enhance the working of the existing R.A.C. organisations. Its benefits will particularly apply to A.C.U. members, in virtue of the fact that they are associate members of the R.A.C. A.C.U. members will thus be offered additional practical advantages in the way of assistance on the road, insurance facilities, and in other directions.

Extending the Scheme.

It has been arranged to administer the new service scheme by means of R.A.C. repairer agents, who are now being specially appointed throughout the country, and the Club anticipates that within a very short time motor cyclists will be able to receive the additional advantages of the new scheme, should they desire these, in any city or town in England and Wales.

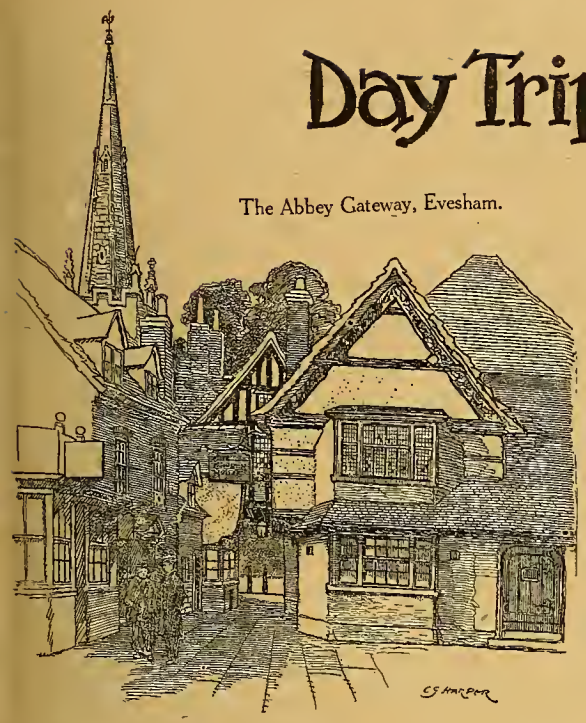
Already several thousands of new R.A.C. repairer agents have been arranged for, and the Club is endeavouring to appoint suitable garages and other businesses to maintain the new scheme in every locality. The R.A.C. agent will be readily distinguished by the new agent's sign, which we illustrate below, displayed outside his premises

The R.A.C. "Official Agent" sign. "Get-you-home" service is available wherever it is exhibited.

The R.A.C. repairer agent, with garage facilities approved by the committee, will prove a very useful person to A.C.U. members. One of the principal objects of his appointment is to render motor cyclists service in connection with the well-known "Get-you-home" scheme. Once the scheme is in full working order, wherever an A.C.U. member may meet with a breakdown or accident on the road he ought to be sure of obtaining practical assistance from an R.A.C. repairer agent. On receipt of the A.C.U. official "Assistance required" voucher the R.A.C. repairer agent will send a relief car to convey him and his passenger home, or to a railway station, within the limits of distance prescribed by the scheme. The "Get-you-home" scheme is one of the most widely appreciated of the many advantages of A.C.U. membership, and, augmented by the new facilities of the repairer agent service, it will prove of still more practical service to motor cyclists than hitherto. Wherever the A.C.U. member sees the R.A.C. repairer agent's official sign there he may be sure of ready and adequate assistance to cope with every kind of accident or breakdown on the road.

Day Trips and Week-Ends

By Chas. G. Harper



The Abbey Gateway, Evesham.

Instalment No. I.—Birmingham to Builth,—appeared in "The Motor Cycle" of July 17th.

II.—Oxford to Evesham, Tewkesbury, and Stow-on-the-Wold.

THIS is a round of 91½ miles from the University City and back, visiting some interesting country, and including a few byways not often explored. Making a start from Carfax in the centre of Oxford, the way out lies along Cornmarket and St. Giles's ("the Giler," according to University slang), and so along the well-worn route to Woodstock. The explorer probably will not want at the opening of his run, in eight miles, to turn aside in Woodstock town to visit Blenheim Park and Palace, which, together with the parish church, are found along a more or less obscure byway on the left of the main street. For the rest, Woodstock is a decayed old market town, which by no means realises the promise of its pretty name. We leave it without regret, and so through Over Kiddington and Road Enstone. It is a road characteristic of most Oxfordshire main roads: forthright and a little bare and grim. A left-hand fork in a further three miles leads direct to Chipping Norton. Let us, however, ignore this, and proceed into that town by the cross roads in another mile: this for the sake of seeing all that remains of "Chapel House," marked on the half-inch maps. Truth to tell, the actual sight is not inspiring: just a long range of farm-like buildings and a private house; but the place has an interesting history, for here was the "Chapel House" Inn, one of the best country hostelries in coaching times. Everyone knew it by that name, and so it is rather difficult to come by its real sign, which was the "Shakespeare's Head." The name "Chapel House," which sounds a good deal more devotional than we might reasonably expect of a house of entertainment for travellers, arose from the site having once been that of a wayside oratory and guest-house on what was then a lonely road. So it was not altogether a wrench from that ancient association when an inn was built here. Not a wrench, only a development. It was at "Chapel House Inn" that Doctor Johnson in 1776 held forth to the admiring Boswell upon the excellence of inns in general, concluding with an emphatic "No, sir, there is nothing which has yet been contrived by man by which so much happiness is provided as by a good tavern or inn."

The old-timbered buildings of Tewkesbury, which go to make the town one of the most picturesque in the Midlands.

A Puzzling Route.

Chipping Norton is a curiously half-decayed and half-revived kind of a place on an awkward site and a still more awkward branch railway. I do not think it can possibly interest anyone very much. But to get out of it, that is something of a puzzle for the motorist in a hurry, who has come in by the route detailed above, and who wants to get away on the road for Moreton-in-the-Marsh. The way out is, in fact, opposite the Town Hall, into New Street, which has every appearance of being an obscure alley leading nowhere in particular. But it is the main road, which presently broadens out and goes pleasantly enough past "Cross Hands" Inn. At one mile beyond that landmark, Little Compton is on the right, and on the left, one mile, is Chastleton House, the great mansion built about 1610 by one Walter Jones. There the Royalist, Capt. Arthur Jones, was successfully hidden, although the Parliamentary soldiers sought the place diligently for him. His hiding hole, and another, are there to this day, and so are many ancient relics.

We come into Moreton-in-the-Marsh past a tall stone pillar on the right. It bears no inscription nor any indication of its purpose, but it is the "Four Shire Stone," and marks where Oxfordshire, Warwickshire, Gloucestershire, and Worcestershire meet. Moreton is not in a marsh, nor ever was. The name means "Moreton-on-the-border," or in

the march: a very different thing from "marsh." The term survives in the "Marches of Wales," the borders between England and that Principality, and is hidden in the title of "Marquis," a marquis having been originally a Lord Marcher. The small town is remarkable for little else than its long broad street, for the imposing modern Town Hall, and for a small curfew turret surmounting an old lock-up for petty offenders. But if you care for the trouble of seeking the Cottage Hospital, there will be found in it a relic scarcely to be expected in such a place. It is the chair in which Charles I. sat during his trial. One further item about Moreton. It is situated on the ancient Fosse Way: a road crossing at right angles to our route.

In the Cotswold village of Stow-on-the-Wold.

Two miles out, on the way to Broadway, begins the long, heavy rise past Bourton-on-the-Hill, to 940ft., which marks the summit of the road over Broadway Hill. Away to the left, Broadway Tower, a modern building, marks a height of some 80ft. more. Just where a road goes off on the right to Chipping Campden, note the ancient signpost with seventeenth century iron arms, giving the mileages to various places, all wrong. Correct enough in its day, road alterations have now rendered it hopelessly at fault. Incidentally, it is the oldest signpost in England. The pretty little "Fish" Inn stands beside the road just before it goes down, steeply and lengthily, into Broadway. Beneath the picture of a trout (if it *is* a trout) are the quaint lines:

"The Fish, at the top of the Hill,
But how it came there is more wonderful still."

Broadway is *the* show village of Worcestershire: a little too much so now to be quite natural. The beauties of it began to be appreciated some twenty-five years ago, when Mary Anderson married and became Madame de Navarro, thus making it something of a pilgrimage for Americans. A little earlier the American artists, Millet and Edwin Abbey, had settled there, and about that time the fine old "Lygon Arms" Inn, built about 1620, and long known as the "White Hart," began to be restored and brought back to the beauty and the stateliness from which it had fallen when railways caused the traffic of the roads to decay. To-day it is one of the finest country hostelries in England. Broadway is a combination of beautiful antiquity and of exceeding modern neatness. The long broad street has here and there little selvedges of grass in front of the cottages: little strips all kept in the perfection of well-mown tidiness. Much could be said of Broadway if space permitted, which it does not. A church built in 1840 serves to save the inhabitants the walk of one mile to the old parish church; but it is a beautiful walk, and the modern church, as may readily be supposed, has neither the beauty nor the interest of the old one, which, by the way, contains a memorial brass to the innkeeper of the "White Hart," John Trevis, who largely remodelled the house in 1620.

A group of old-world buildings in the village of Eynsham.

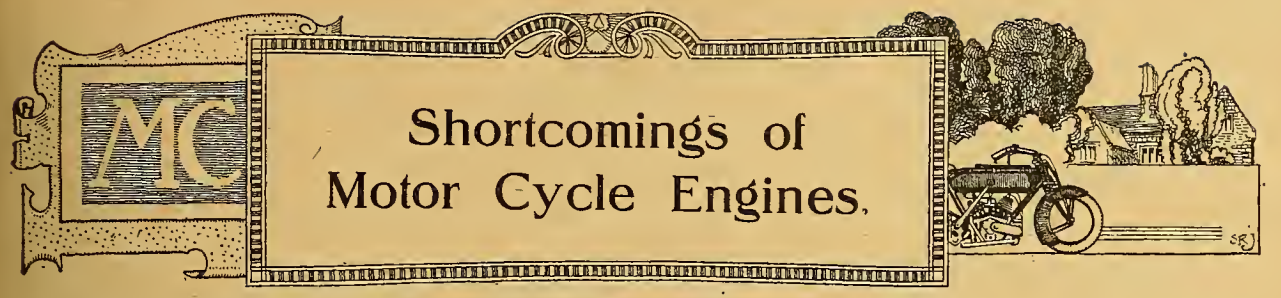
In less than five miles we reach Bengeworth, a suburb of Evesham, on this side of the Avon. To explore the town, cross the fine bridge and up the High Street. To-day Evesham lives for and on fruit. It is the great centre of Worcestershire fruit-growing, particularly of plums. But in the old days it was a great religious community. Here was one of the stateliest abbeys in the kingdom, but of it there is almost nothing left, except the fine Bell Tower, the quaint little entry called "Abbey Gateway," and the old building known as the Almonry.

Retracing the High Street, and crossing the bridge, we turn south along a level road through Sedgeberrow to Teddington Cross Hands.

Our return journey begins here. It is 15¾ miles to Stow-on-the-Wold, and a hilly road, climbing to the Cotswolds up Stanway Hill, and past the little inn, the "Plough," at Ford; every way you come up into hilltop Stow, and it is a meeting place of many roads. We leave it by the Burford Road, branching off in 3½ miles, to the left, for the pleasant byways through Westcote, Idbury, Fifield, and Shipton-under-Wychwood, an old-world village with an equally old-world inn, the "Crown." Thence to Leafield, where are situated the nine lofty masts of the Marconi wireless station, which have been visible for miles. Those tourists who take these winding byways will find themselves repaid in interest for doing so, and they bring you out by preference from Leafield, in three miles to Minster Lovel, where the great ruins of the ancient manor house of the Lovels stand by the river Windrush and the old church of St. Kenelm. Here the by-road comes up to the great Oxford and Gloucester road. Reaching it, we turn left and come in less than three miles to Witney, famous for blankets, with its quaint old butter cross, and stately church situated at the further extremity of an unexpected *cul-de-sac*.

And so home to Oxford, in another 11½ miles, past the village and toll-bridge of Eynsham. From Eynsham, most of the way into Oxford, the road has lately fallen into an abominable condition.

Instalment No. III will deal with Oxford to Cirencester and Cheltenham.



Shortcomings of Motor Cycle Engines.

Some Impressions and Deductions derived from a Study of Aero Engines. Part II.

(Continued from page 138, August 7th.)

JUST at first there will probably be but little change from the standard side-by-side valve position, but I am convinced that, as soon as the great British public can be convinced that overhead valves can be made practically unbreakable, there will be a great change, and the overhead type will become as universal as the present arrangement of side-by-side valves.

The reasons in favour of overhead valves are so overwhelming that they cannot be denied. Increased efficiency, which means, among other things, improved fuel consumption and better cooling for the head, are the first items to be considered.

It has been conclusively proved that a good design of cylinder head with overhead valves is indispensable for real efficiency. Aero engine research has proved that it is possible to obtain with well-designed air-cooled cylinders better m.e.p.'s than those obtained before the war on even water-cooled racing car engines. This has been brought about almost entirely by improved designs of cylinder head and valve ports, in conjunction with improved cooling due to the use of special materials for cylinder head construction. The cooling is important, but for such small cylinders as those used in normal motor cycle construction, the cooling of a cast iron head, *if properly designed*, will probably be sufficient for all normal purposes.

Cooling Problems.

A great deal of thought may well be expended advantageously on the subject of cooling. Why is it, for instance, that many (probably most) motor cycle designers turn out engines with less cooling surface on the head and valve ports than round the cylinder, *i.e.*, reduced cooling surface just where it is most needed? Possibly this is due partly to the look of the thing and partly to the fact that deep fins round the exhaust port of the average side by side valve 500 c.c. cylinder would be apt to burn the rider's trousers. Well, these two objections no longer hold good in the case of o.h.v. engines, and it is possible to arrange deep fins round the head and exhaust valve ports without any detrimental effects. Even the shape of the cooling ribs is important, and there is a tendency to err in the direction of super-thin rib roots when cast iron cylinders and deep ribs are involved. The use of aluminium cylinder heads is obviously desirable, owing to the improved cooling which this material provides, but its adoption becomes a question of construction and production rather than desirability, and though the ultimate inclusion of aluminium heads in all first class specifications is almost a certainty, there are one or two manufacturing difficulties yet to be cleared up.

To return to the question of valve gear, which is intimately connected with cylinder head design, two difficulties arise in connection with overhead valves—great overall height (in the case of a vertical single-cylinder) and noise. These are real troubles, but neither is insuperable. In the first case, provided the engine can be got into a reasonable frame (a matter which presents little difficulty unless a very long stroke is used), a detachable head will solve any difficulty with regard to accessibility. The second case requires more consideration, especially if high efficiency cams are to be used. At the same time, it will be found that if ample bearing surfaces are employed for the rocker arms and special arrangements are made for their lubrication, there will not be any undue clatter. Added to this, it is a comparatively easy matter to enclose even overhead valve gear in such a way as to ensure adequate protection.

Lubrication.

Lubrication has been a vexed question for a long time in this country. Most designers have avoided the question as far as possible by introducing ball or roller bearings whenever there is room for them and leaving the cylinder and gudgeon pin to be lubricated by "hope," or whenever the rider feels inclined. This system, for some mysterious reason, has worked fairly well (probably because motor cyclists as a whole are enthusiasts who take the trouble to learn enough about their mounts to know when oil is required). At the best, however, this is a hit and miss system, even the drip feed oil supply requiring considerable skill in regulation if it is to be really satisfactory under varied conditions. The latest innovations in the way of throttle controlled oil pumps are a step in the right direction, and when properly carried out are as near perfection as possible with any system which relies merely on the amount of oil fed in, but if an oil pump is to be used, why not have a proper lubrication system? A small gear pump of sufficient capacity for the average motor cycle engine is an absolutely fool-proof device, and its cost would easily be saved by the absence of ball bearings. By the use of a forced lubrication system a proper supply of oil could be ensured for all bearings, and if it were considered desirable, the relief valve spring tension could be controlled in conjunction with the throttle, so that when the engine is under load oil would be delivered at higher pressure than is normally the case. A simple system of forced lubrication is a blessing beyond words, and, provided that the filtering arrangements are properly carried out, there need be absolutely no fear on the score of unreliability.

The Shortcomings of Motor Cycle Engines.—

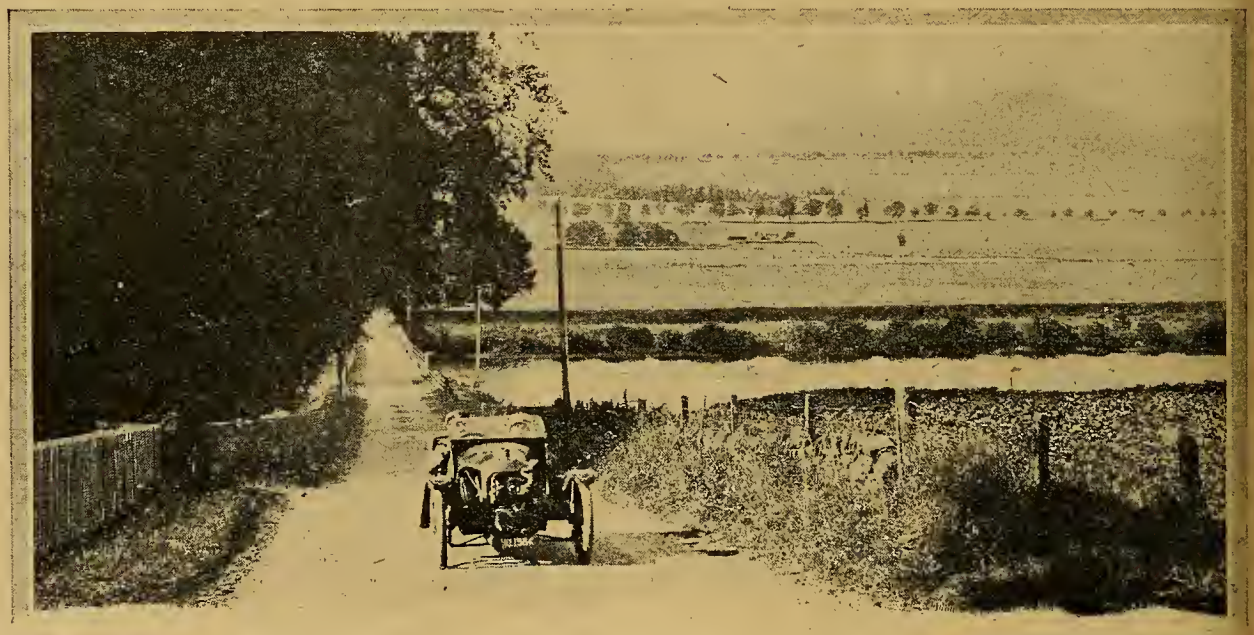
So long as inside flywheels are used on motor cycles, so long will there be trouble in the lubrication of plain big end bearings, unless forced lubrication is employed. Several ingenious devices have been produced to alleviate this trouble (J.A.P., Abingdon, etc.), but even these depend to a degree on the regularity with which the engine is supplied with oil.

Conclusion.

The merits of the single, V twin, flat twin, four-cylinder, and two-stroke have already been much discussed, and each will undoubtedly have its own admirers. All, however, can be improved, and it is with the idea of destroying the rut into which motor cycle design has been running for some years that this article has been written.

Engineering is a specialised profession, and the science of the internal combustion engine is becoming more and more specialised day by day. Wonderful things have been accomplished by motor cycles in the past. Let us hope that our hobby (and business) may rise above the rather crude stage which it has now attained. A few far-seeing manufacturers have given us a lead, and a few have disappeared (sad to relate) on account of the "lack of conventionality" of their mounts. It is not an easy matter to educate the public, but now, if ever, is the great opportunity, when the world is full of new ideas. Possibly these notes will draw forth a cloud of abuse from some of the more conservative amongst both manufacturers and public. However, the suggestions may be taken in the spirit in which they are meant, for it is high time that "hit and miss" methods should be discarded, and that specialisation should take place, not only in materials, but in all other departments of this modern industry.

A.M.I.A.E.



A Scottish panorama. A Morgan on a hill near Contin between Beauly and Braemore, north of the Caledonian Canal, in the Inverness district.

IRISH TWO-DAY RELIABILITY TRIAL.

THE Dublin and District M.C.C. held its annual two-day reliability trial to Glengarriff and back on the 2nd and 4th August, the total distance covered during the run being 446 miles. The first day's route was through Kildare, Cashel, Lismore, Cork, and Macroom, the mileage being 225. The next day was given over to sight-seeing, and on Monday the return journey *via* Killarney, Limerick, Roscrea, and Maryborough was commenced, the distance being 221 miles.

Twenty-two competitors were started by the timekeeper, Mr. S. L. Hutchinson, on the Saturday morning, these being:

W. H. Freeman (7-9 Indian sc.)
P. H. Hurse (4¼ B.S.A.)
T. Woods (4¼ B.S.A.)
Maj. Waters (2¼ Baby Triumph)
J. Browne (2¾ Douglas)
H. McAllister (4 Triumph sc.)
Maj. V. Farrell (6 A.J.S. sc.)
Dene Allen (3½ Norton)
A. Carton (7-9 Indian sc.)
O. Grimes (2¾ Douglas)
W. J. Burney (8 Enfield sc.)
J. P. O'Brien (7-9 Indian sc.)
Randall Walsh (8 Matchless sc.)
G. Kilroy (3½ Sunbeam sc.)
W. J. Chambers (6 A.J.S. sc.)
J. Adair (2¼ New Hudson)
C. W. Johnstone (3½ Sunbeam)
C. S. Kettle (4¼ B.S.A.)
S. Redmond (5 Indian)
F. McDonagh (4¼ B.S.A.)
S. Smith (4 Triumph)
J. Skehan (4 Campion)

Rory Smith (7-9 Indian sc.) did not start.

During the earlier part of the trial the weather conditions were ideal, but later there were heavy showers which became prevalent.

Allen (Norton) suffered a leaking tank, and the following stopped on Crowlane Hill: Grimes (Douglas), Freeman (Indian sc.), Chambers (A.J.S. sc.), Walsh (Matchless sc.), and O'Brien (Indian sc.)

Major Waters (Baby Triumph) climbed all hills, including Crowlane.

At the final check at Inchicore, the following arrived to time on Monday evening:

P. H. Hurse (4¼ B.S.A.)
T. Woods (4¼ B.S.A.)
Maj. Waters (2¼ Baby Triumph)
J. Browne (2¾ Douglas)
H. McAllister (4 Triumph sc.)
Maj. V. Farrell (6 A.J.S. sc.)
A. Carton (7-9 Indian sc.)
W. J. Burney (8 Enfield sc.)
Randall Walsh (8 Matchless sc.)
W. J. Chambers (6 A.J.S. sc.)
C. W. Johnstone (3½ Sunbeam)
C. S. Kettle (4¼ B.S.A.)
S. Redmond (5 Indian)
F. McDonagh (4¼ B.S.A.)
S. Smith (4 Triumph)

The probable team prize winners are Smith, McAllister, and Waters, who were mounted on Triumphs.

1914 v. 1919.

The Experiences of a Middle-aged Novice.

RECORDED BY VETERAN.

A SHREWD and judgmatical man of forty figures as my most recent convert to motor cycling (all good motor cyclists are missionaries). With his conversion I combined an experiment in taste. He possessed a sturdy prejudice against motor cycling, based on what he had seen and heard; and I thought his unprejudiced opinion on our old 1914 ideals and their modern successors might be interesting. By way of a decisive test he was to cover thirty miles of carefully selected road twice, using a 1914 machine on the first occasion, and a 1919 specification on the second trip. The value of a fresh judgment is shown by the fact that his verdict surprised such an old stager as myself in several quite important respects.

The two machines were carefully selected. The 1914 model was a single-cylinder of excellent quality, with one of the very best spring forks and smoothest transmissions. The up-to-date mount had a flat twin engine, automatic carburetter, and a fully sprung frame. I should add that a middle-aged rider was utilised as the arbitrator because the future of the industry does not depend upon youthful opinion, as is often fallaciously supposed: the older men have more money at their command, they "embrace" women psychologically if not physically, and they are often too fat and lazy to cycle. These three factors lend weight to their judgment as to the saleability of a given model.

1914.

The rider, who shall henceforward be designated as "Jones," made his first thirty mile trip on the 1914 model without incident. At the end of it he waxed extremely talkative. I gathered that he would only purchase a sister machine on the grounds that his dimensions precluded push-cycling, whilst his means did not run to a car. On the other hand, he had enjoyed the speed and the fresh air. Asked to specify the disagreeables in his novel experience, he identified the following defects with much fluency and little hesitation:

1. *Weight.*—His discarded push-bicycle weighed 22 lb. It was absurd to ask him to lug about a monster scaling 2½ cwt. He made picturesque references to hauling it through the small pedestrian gate at a level crossing

2. *Vibration.*—He objected to feeling the engine in every nerve of his body, and said that when he wanted electric massage he knew where to get it good. But his language on this point paled its ineffectual fires when he started on road vibration. (In actual fact, the road was excellent as roads go, and the spring fork quite admirable; he can have sustained no road vibration except that emanating from the back wheel; anyhow, he said that "the road kept hammering his backbone.")

3. *Carburetter.*—This was of the two-lever "sensitive" type. It is not abnormally sensitive, but the air must be shut off for picking up from a crawl, and it requires frequent adjustment if the speed is varied over a wide range.

1919.

When Jones had blown off steam on the subject of the 1914 model, he was despatched over the same road on a 1919 machine. I innocently expected him to be enthusiastic at the end of this jaunt, and did not suppose he would have any criticisms at all to offer. Quite obviously, he had enjoyed the second trip more than the first, and his conversion was complete when he dismounted. To edit his praises first, the items in order of mention were:

1. *Carburetter.*—The 1919 vaporiser was of the single-lever type, and the simplicity of this control appealed to him enormously. He did not allude specifically to several restarts, a tricky little hill, and several awkward corners along the route; but spoke rather of the general comfort engendered by a simple control which "always did what you wanted."

2. *Comfort.*—He enlarged on the complete absence of vibration, and marvelled that anybody still troubled to make or ride such liver-joggling mounts as the rigid frame single-cylinder. (I doubt if he could distinguish between road and engine vibration: both were present on the 1914 model, neither on that of 1919.)

3. *Conking.*—He enquired quite angrily why the older machine sounded as if it were breaking in half round a bad corner whilst the new one slid round right angles like a pushcycle. (I blamed his driving; but only a clever rider can coax this particular 1914 engine round a really sharp corner on top gear without getting an anvil exhibition.)

Gear Changing.

Now come my surprises. He denounced two points in the up-to-date specification with unmeasured ferocity. The first was the gear box. Against this he had two plaints. The more violent was that you had to do so many things at the same time (*i.e.*, set the throttle, declutch, and move the gear lever); whereas, on the older machine, gear changing was as simple as "giving the new fellow more gas" (the 1914 mount had a foolproof gear change, independent of clutch or throttle work). "Jones" would evidently applaud Henry Ford's judgment in giving the general public a gear change which can neither be missed nor scrunched. It would appear that Jones's tribula-

1914 v. 1919.—

tions mostly occurred on the only real hill along his route, where he forgot his steering in the effort to change down, and succeeded in missing gears, all but ramming a bank, and finally commenced to slide backwards and toppled over. But he also described, with some bitterness, how he had dropped from top to bottom when he wanted second, and how the machine had nearly stopped, and he had nearly gone on without it. I draw the attention of designers to Jones's opinion about complex gear changes. Hardly less pronounced were his views on the frequency of gear changes. I do not think these are quite to the point, seeing that a flat twin of 3½ h.p. need not demand more gear changes than a single of the same power; but the 1919 type employed does not climb trees on its top gear, and, as explained above, Jones had a great distaste for its gears at the best of times.

Secondly, he denounced its weight very violently, and made hopeful enquiries about a scooter. Possibly this criticism should be classed with others in respect of which any novice's opinion is unsound. For example, Jones is not qualified to pronounce upon accessibility, cleanliness, lubrication, sideslip, and various other vital topics, on two of which the single-cylinder probably scores quite heavily. The contrast between a 22 lb. pushcycle and even a scooter at perhaps 75 lb. actual is sure to be felt at first; it is quite possible that the change from 22 lb. to, say, 175 lb. would not be noticed more materially. In neither case did Jones have the luck to enjoy an automatic lubrication system. He did not complain about the hand pump: when challenged, he merely said, "Oh, that did not bother me; it was easy to remember a pumpful at X (the halfway house, going and coming) and at Y (the turning point)"; but I should argue from his strong dislike of two-lever carburetters that a hand pump would annoy him on a long journey.

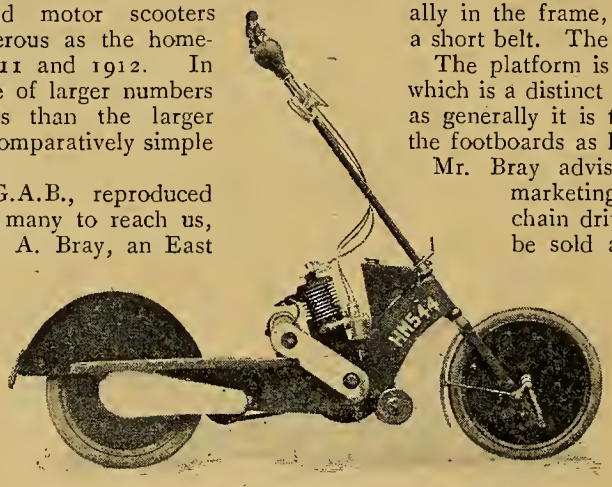
To sum up, this particular novice set a high value on comfort and on foolproof controls of his engine and gears. I fancy most novices would continue to endorse these points as their experience ripened. He further regarded our standard weights as ridiculous: on this question experience might modify his judgment.

A Scooter with Pressed Steel Frame.

PRIVATELY constructed motor scooters are becoming as numerous as the home-made cycle cars of 1911 and 1912. In fact, there is greater promise of larger numbers of miniature single trackers than the larger machines, because they are comparatively simple and cheap to make.

The illustration of the G.A.B., reproduced on this page, is one of the many to reach us, and is the design of Mr. G. A. Bray, an East Ham enthusiast, at present in the R.A.F.

As will be seen a pressed steel frame is employed, the transmission is enclosed, and disc wheels are fitted. The last mentioned are 16in. in diameter. The engine fitted is a 2¼ h.p. two-stroke, placed diagonally in the frame, and drives a countershaft by a short belt. The final transmission is by chain.



The G.A.B. scooter fitted with 2¼ h.p. two-stroke engine.

The platform is well above the wheel centre, which is a distinct departure from usual practice, as generally it is the aim of designers to place the footboards as low as possible.

Mr. Bray advises us that he contemplates marketing a similar machine with all chain drive, which, it is expected, will be sold at a figure in the neighbourhood of £25. Several new features may be embodied, including a mechanical hand starter, a band brake on the rear wheel, an improved spring fork, and 16 × 2⅜in. tyres. Twist grip controls are also under consideration, as they are better suited to short bars.

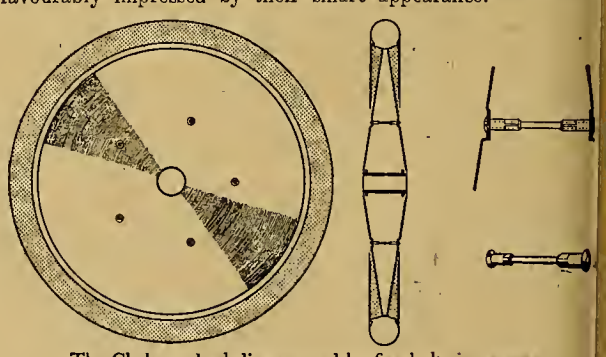
REFINEMENTS IN WHEEL DISCS.

A MACHINE equipped with wheel discs is regarded in some quarters as being ultra-fashionable, but there is another reason, however, why their present popularity may increase instead of diminish. This is the point of convenience in cleaning. To clean a wire wheel is a long and irksome task, and for this reason one or two firms have experimented with artillery wheels, which, we understand, were found too rigid. It would appear, therefore, that wheel discs will retain their popularity for some time to come, and it is not surprising to find several firms seriously entertaining the production of them on proper engineering lines. It is not sufficient to cut out discs with a pair of hand shears, and fix them by ugly nuts and bolts. Nothing looks so unfinished as some of the wheel discs at present on the road, which are generally "home" produced.

One of the firms entering this field with a neatly and correctly constructed disc is the Chelsea Aviation Co., Ltd., 30, Whiteheads Grove, Chelsea, S.W.3.

The discs may be had in either black enamelled steel or polished aluminium. They are held together by five bolts midway between the hub and the rim, and have the merit that they will neither rattle nor work loose. The bolts are completely encased, and access to the valve is obtained by means of a slide.

We noticed a Douglas outfit in the London-Edinburgh run which was equipped with these discs, and we were very favourably impressed by their smart appearance.



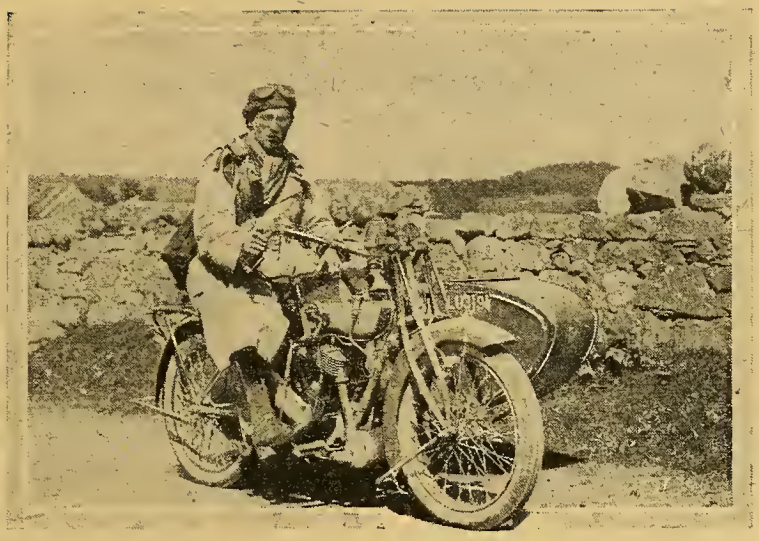
The Chelsea wheel disc secured by five bolts in recesses.

1,768 Miles in Twelve Days.

Photographing the Scottish Six Days Trial on a Victory Model Matchless.

BY "THE MOTOR CYCLE" STAFF PHOTOGRAPHER.

PHOTOGRAPHING the Scottish Six Days always means ten or twelve days of hard riding, and, after following the 1913 and 1914 events on a solo machine, I decided that a sidecar is better to accommodate the heavy paraphernalia which it is necessary to carry in order to obtain a good selection of photographs representative of the riders, the machines, and the course.



The Motor Cycle photographer aboard his 8 h.p. Matchless outfit.

This year the event, for me, was a very rushed affair. I was away on holidays at the time the Editor decided that my fingers should press the button. I was recalled from the coast by wire, and had thirty-six hours in which thoroughly to overhaul the machine and fit new tyres. My mount is an 8 h.p. Victory Matchless with many thousands of miles to its credit, so I made my way straight to Messrs. Colliers at Woolwich, arriving at noon on the Wednesday prior to the trial. A few words with C. R. Collier to explain matters were sufficient for this sporting manufacturer. He helped to dismantle the machine himself, and very soon the engine, gear box, and wheels were out for overhaul. In the afternoon he turned his men on to the job, and by 6 p.m. I left the works with the machine in trim for the strenuous week's work.

With the same good-hearted sportsmanship as displayed by the Collier firm, the Palmer Tyre, Ltd., fitted a new set of tyres, and by midday on Thursday I was ready for the Northern trip. With the exception of a stop to rectify the timing, which had slipped, the run to the Scottish capital was without incident other than running into a very bad thunderstorm a few miles from my destination. The actual running time was sixteen hours—25 m.p.h. average.

During the trial, with one exception, the machine gave no trouble, and climbed every hill but Aultnaharie, which I did not trouble to descend, since the competitors were returning up the hill almost immediately. The little trouble experienced was concerned with the magneto. The fibre brush on the contact breaker arm is evidently soft, and twice wore down, the result being that the points failed to break. It would be interesting to know if any readers have had similar trouble.

I left Edinburgh on the day following the conclusion of the trial and cruised back to London at an easy speed, arriving on Tuesday morning. The Victory Matchless is fitted with an 8 h.p. J.A.P. engine and an Amac carburetter, and my petrol consumption works out at over 60 m.p.g., but under less strenuous conditions I frequently obtain 70 m.p.g. despite the heavy loads I usually carry.

My total mileage to provide readers of *The Motor Cycle* with a photographic record of the 1919 Scottish trials is 1,768—covered in twelve days.

Home Produced Petroleum.

English Petrol in Abundance. Norfolk Deposits said to be the Richest in the World.

NOT the least important phase of the war is the manner in which our home resources have been developed. A country such as ours, which made no pretence of being self-supporting in many of its most vital requirements, might have found itself in even graver difficulties than we experienced, but our natural possibilities were explored in every way, and we emerged from the crisis in a position of much greater potential strength than ever before.

It has long been taken as a matter of course that our petrol supplies should come from the recognised oil-well districts of the world, but to-day we know that geologists consider the oil-bearing shales of Norfolk, hitherto of hazy existence to the man in the street, to be the richest in the world.

The credit for the discovery of the value of these deposits is due to Dr. Forbes Leslie, F.G.S., who estimates that two-thousand million tons of shale lie ready for mining, and that a yield of 200,000,000 tons of petroleum products may be expected; the value of this is apparent when our yearly consumption is only 1,500,000 tons.

The workings are already in hand, and one distillery is now in operation, so that in the near future we may hope to have abundant supplies of petrol produced within our own boundaries.

NO AGE LIMIT.

A Further Selection of Letters from Riders of Mature Years.

IN our issues for June 26th and July 3rd and 10th we published several letters from motor cyclists of advancing years, all of whom testified that there is practically no age limit where the motor cycle is concerned.

The following is a list of some of these riders, their ages, and the machines they use:

	Age.
Mr. Robins (3½ Rex)	81
Rev. J. Parnell (sidecar)	79
Mr. R. Wolstenholme (4½ Excelsior)	77
Mr. Jas. Scott (2½ Calcott)	75
Capt. H. C. Hollenbeck (Cleveland lightweight)	73
Mr. J. E. Jones (Cleveland lightweight)	72
Rev. E. W. Wilmott (3½ Sunbeam sc.)	72
"An Irish Canon" (4 Triumph sc.)	72
Mr. J. R. Marsh (4¼ B.S.A. sc.)	70
Mr. R. Cumming (Baby Levis and Triumph Junior)	69
Mr. F. G. Hillyer (6 Enfield sc.)	68
Rev. A. G. Stembridge (3½ Triumph sc.) ..	67
Mr. W. Crooke (3½ Rover sc.)	67
Mr. Sibley (2¾ Allon)	65
Mr. S. Walker (Triumph Junior)	65
Mr. A. J. Hicks (Triumph Junior)	63
Mr. John Watson (4 Lincoln Elk sc.)	61
Mr. Geo. J. Bragg (4¼ B.S.A. sc.)	55

This week we are able to give another selection of letters, and, incidentally, one is from an eighty-three-year-old reader, who so far heads the list, and until a rider is found who exceeds him in age, may be regarded as Britain's oldest motor cyclist. This rider is Mr. Elias Blackburn, of Redcar, who has been a reader of *The Motor Cycle* since No. 1. He writes as follows:

"Seeing that you have been publishing particulars of aged people who ride motor cycles, I send you my picture, as I can take the lead of any published up to date. My age is eighty-three, and I have ridden almost every make of bicycle from the dandy-horse seventy years ago. My motor cycles include L.M.C., Premier, and several others, which I have always ridden solo, and nothing would give me greater pleasure than to meet other motor cyclists who, like myself, are getting on in years.

"I must add that, from a health point of view, the effects of motor cycling have been decidedly beneficial."

Another young-old rider of seventy-seven summers is Mr. W. H. Marshall, of York, who uses a 2¾ h.p. New Imperial-Jap with a light sidecar, in which he carries a camping outfit. Mr. Marshall took up the motor cycle after a lapse of fifteen years, so he was one of the pioneers. He obtained his machine last Easter, and advises us that, after three or four attempts to start it, he rode fourteen miles without any trouble. After a few short runs, he ventured upon a hundred-mile trip. Although he has ridden the machine solo, Mr. Marshall prefers the sidecar, and is now planning a camping tour. Last year this young-old reader rode from York to London and back on a pedal cycle with tent and kit, camping on the way.

Mr. Elias Blackburn, age 83 years.

J. L. Norton, the designer of the record-breaking Norton motor cycle, is a rider of long experience, having few compeers as a driver. It may be said that the Norton has been developed on the road experience of its designer and those associated with him.

Mr. W. H. Marshall, age 77 years.

Here is another example, proving, without question, that motor cycling is a pastime for all ages.

Mr. R. Parnell.

Another rider, sixty-seven years of age, who hails from Launceston, is Mr. Richard Parnell. For several years he used a lightweight fixed gear machine, and derived much enjoyment from it. Of late he has used a two-speed geared model, and naturally finds it mu easier to manipulate.

A sixty-seven year old rider, who u his machine regularly, is Mr. Cornwa Knapp, St. Helen's Cottage, Byfle whose remarks we quote:

"I was born on 5th June, 1852, a am just on sixty-seven.

Mr. C. Knapp.

"I still use my motor cycle daily, and up to 1914 made long tours lasting up to three weeks, occasionally riding over three hundred miles in the day, and propose to make some long tours this summer.

"As an engineer by profession, I naturally took motoring as soon as I saw its possibili (about 1900). Have toured over pra cally the whole of this country, parts of France. In recent years I h used a Zenith with 4¼ h.p. Preci engine for heavy touring, and a twin 2½ h.p. for light work."

If any other readers of mature y care to place their experiences on rec we shall be pleased to hear from them

In the meantime, we conclude that Elias Blackburn, of Redcar, is the ol motor cyclist, and until we hear fro older rider claiming this distinction, readers, like ourselves, will look upon Yorkshire veteran as heading the lis young-old motor cyclists who prove so far as the pastime is concerned, t is no age limit.

TWENTY-FOUR HOURS TRIAL.

On the 22nd and 23rd inst. the Motor Club will hold its twenty-four h ride from Woodford to York and starting from "The Eagle Hotel," Sn brook at 7 p.m.

In addition to the cup presented by Triumph Cycle Co., and gold, silver, bronze medals, several special aw have also been offered, namely, a s challenge cup, and a special prize wi presented by the Hendee Manufactu Co. for the best performance by a pr owner.

Entries (15s.) should be sent to Douglas Kapadia, Holme Villa, A Road, Loughton, Essex. The compe is confined to club members only.

N.M.C.F.U. (Sheffield).

The above branch of the N.M.C.F.U. will hold a sports meeting on the 16th, at Cordwell Valley.

Kidderminster M.C.C.

The results of the recent petrol consumption test are as follow:

	m.p.g.	Fig. of Merit.
1. J. S. Nickson (3½ Rudge) ..	130	14.4
2. L. Naylor (6 A.J.S. sc.) ..	53	14.5
3. A. W. Lucas (4 Triumph sc.)	72	12.8

N.M.C.F.U. (Derby).

A national inter-meet will be held in the centre of Newtown Linford, near Bradgate Park, Leicester, on the 24th inst. at 2.30 p.m. It is anticipated that the record of Stratford (700) will be easily passed.

Oxford M.C.

The membership of the club is fast increasing, and local motor cyclists interested in competitions and other club events should first communicate with the hon. sec., Mr. A. Morton Bailey, 43, Cornmarket Street, Oxford.

North Derbyshire M.C.C.

The above club will hold a hill-climb on the 20th inst., for members only. Five classes are arranged: 350 c.c. and 600 c.c. solo on formula, 600 c.c. and unlimited on time, and 600 c.c. and unlimited passenger machines on formula. Entries close on Monday, the 18th inst.

Birmingham M.C.C.

The results of the Midland Cup trial are as follow: T. Stevens (4¼ James sc.) and H. Denley (8 Morgan), equal holders of the Midland Cup; team prize, New Imperial team (Messrs. Taylor, Arch, and Sellis). No other competitors qualified for awards.

Southport A.C.

This newly formed club has made a good start with a successful opening run, which, despite the inclement weather, attracted a good muster of members. The headquarters of the club are the Queen's Hotel, Southport. Any interested local motor cyclist should communicate with the secretary, Mr. H. Dobson, 5, York Avenue, Birkdale, Southport.

N.M.C.F.U. (Leeds).

A rally of motor cyclists is being organised by the Leeds branch of the National Motor Cyclists' Fuel Union on the 31st. Members will assemble at 1 p.m. at the City Square, and will entertain the limbless soldiers with an outing and tea at Knaresborough. All offers of motor cycles should be forwarded to the hon. sec., Mr. T. W. Lancaster, 7, Evelyn Street, Chapeltown Road, Leeds.

Future Events.

Aug. 16.—N.M.C.F.U., Portsmouth. Run to Selbourne.
Aug. 16.—N.M.C.F.U., Sheffield. Victory Sports, Cordwell.
Aug. 16.—Woolwich, Plumstead, and District M.C.C. Inter-team Trial.
Aug. 16.—Glasgow M.C.C. Run to Lake of Monteith.
Aug. 16.—Public Schools M.C.C. Speed Trial.
Aug. 16.—Rochester, Chatham, and District M.C. Competition for Woolwich Cup.
AUG. 16.—S.E. COUNTIES INTER-CLUB TEAM TRIAL.
AUG. 16.—SOUTH BIRMINGHAM M.C.C. OPEN TRIAL FOR THE PALMER CUP.
Aug. 16-17.—Cumberland County M.C.C. Reliability Run into Scotland.
Aug. 16-17.—Oldham and District M.C. Reliability Trial for Bradbury Cup.
Aug. 16-17.—Wolverhampton M.C.C. Reliability Trial to Barmouth for the Eric Williams Shield.
Aug. 17.—Western M.C.C. (Glasgow). Picnic in the Trossachs.
Aug. 17.—Nottingham and District M.C.C. Run to Matlock.
Aug. 17.—N.M.C.F.U., Coventry. Run to Matlock.
Aug. 17.—Ilkeston and District M.C.C. Run to Castleton.
Aug. 17.—N.M.C.F.U., Portsmouth. Run to Arundel.
Aug. 17.—S. Birmingham M.C.C. Run to Haselor.
Aug. 17.—N.M.C.F.U., Leeds. Sports, Birstall.
Aug. 17.—N.M.C.F.U., Sheffield. Run to Woodhead.
Aug. 17.—Rochester, Chatham, and District M.C. Run to Herne Bay.
Aug. 20.—N.M.C.F.U., Portsmouth. Run to Westbourne.
Aug. 20.—N. Derbyshire M.C.C. Hill-climb.
Aug. 22-23.—Essex M.C. 24 Hours' Ride to York and Back.
Aug. 23.—S. Birmingham M.C.C. Run to Stratford-on-Avon.
Aug. 23.—N.M.C.F.U., Portsmouth. Run to S. Hayling.
AUG. 23.—BIRMINGHAM M.C.C. OPEN HILL-CLIMB.
Aug. 23.—Glasgow M.C.C. Reliability Trial.
Aug. 24.—N.M.C.F.U. Inter-meet at Newtown Linford.
Aug. 24.—Manchester M.C. Gymkhana.
Aug. 24.—N.M.C.F.U., Sheffield. Run to Lincoln.
Aug. 24.—N.M.C.F.U., Portsmouth. Run to Epsom Downs.
Aug. 24.—N.M.C.F.U., Leeds. Run to Grassington and Buckden.
Aug. 24.—Rochester, Chatham, and District M.C. Run to Wateringbury.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 30.—S. Birmingham M.C.C. Hill-climb.
Aug. 30.—N.M.C.F.U., Sheffield. Week-end Run to Boston.
Aug. 30.—N.M.C.F.U., Portsmouth. Run to Halnaker.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
Aug. 31.—N.M.C.F.U., Leeds. Soldiers' Outing.
Aug. 31.—Ilkeston and District M.C.C. Run to Matlock.
Aug. 31.—N.M.C.F.U., Portsmouth. Run to Hayling Island.
Aug. 31.—Birmingham M.C.C. Social Run.
Aug. 31.—Rochester, Chatham, and District M.C. Run to Hawkhurst.
Aug. 31.—Woolwich, Plumstead, and District M.C. Picnic and Gymkhana at Brasted Hill.
SEPT. 5.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
Sept. 6.—Birmingham M.C.C. Reliability Trial for Sangster Cup.
SEPT. 6.—YORK AND DISTRICT M.C. OPEN HILL-CLIMB AT SUTTON BANK.
SEPT. 15-20.—A.C.U. SIX DAYS' RELIABILITY TRIALS.
Sept. 19.—Essex M.C. Gymkhana.

South Birmingham M.C.C.

The entries for the above club's open trial on the 16th inst. close to-day, Thursday, the 14th.

Middlesex M.C.C.

The Middlesex M.C.C. is being reformed, and a special meeting is to be held at the Great Eastern Hotel, room 136, Liverpool Street, on Friday, August 15th, at 7.30 p.m. All members are urgently requested to attend, as well as all motor cyclists who are interested. The secretary is S. A. McCarthy, Essex Lodge, 2, Nightingale Road, Lower Clapton, London, N.E.

Cumberland County M.C.C.

During the past few months strong and successful efforts have been made to re-establish this well-known sporting club, which lost many of its leading members during the war.

A reliability run will be held on the 16th and 17th inst., leaving Carlisle at 1.30 on Saturday, the 16th, riding to Crieff *via* Lanark, Stirling, Bridge-of-Allan, Dunblane, Greenloaming, and reaching Crieff at 8.36. On the following day the competitors will proceed *via* the Sma' Glen, Amulree, Kenmore, Loch Tay, and Rumbling Bridge. The ties resulting from Whit-Monday run will be decided in this run. Over twenty-five members have already entered. The organising sec. is Mr. T. Rutherford, 15, Blackfriars Street, Carlisle.

York and District M.C.

Thirty-eight competitors started in this club's open two-day trial to Edinburgh and back on August Bank Holiday, which was a very successful event. Twenty-five competitors qualified for awards. The following are the results:

G. Jefferson (4 Triumph), cup.
G. A. Reed (2¾ Coulson B.), cup.
E. Wasling (2¾ Coulson B.), retired. Controls gave way.
W. Atkinson (4 A.J.S.), retired. Broken saddle.
G. Walker (4 Triumph), cup.
G. H. Eastwood (4-5 Zenith), retired.
W. N. Tetley (3½ Sunbeam), cup.
R. F. D. Baker (4 Triumph), cup.
A. Kirk (4 Triumph), cup.
R. A. Bonner (2¾ Douglas), cup.
W. A. Porter (Omega-Jap), retired. Lamp troubles.
H. Barton (6 Sunbeam), cup.
B. Hogson (4¼ B.S.A.), retired.
J. Oliver (7-9 Harley-Davidson), cup.
W. R. Eadington (3½ Sunbeam), cup
A. Roberts (8 Zenith), cup.
J. Williamson (4 Triumph), cup.
Jas. J. A. Dias (3½ P. and M.), cup.
P. H. Ingham (3½ Rover), retired.
N. B. Shulders (4 Blackburne), retired.
J. Procter (2¼ Triumph Junior), cup.
A. Procter (2¼ Triumph Junior), cup.
H. Pattinson (4 Triumph), retired.
G. Hill (2¼ Triumph Junior), cup.
F. U. Mundy (2¾ Ruffells), retired. Belt rim adrift.
R. L. Richardson (4¼ B.S.A. sc.), retired.
Rex Muody (8 Matchless sc.), cup.
H. G. Uzzell (4¼ B.S.A. sc.), cup.
W. G. Harrison (6-7 Ariel sc.), cup.
J. S. Wilson (7-9 Yale sc.), cup.
D. Mill (6 A.J.S. sc.), retired.
D. Bradbury (4 Norton sc.), cup.
W. Hoyland (4 Norton sc.), retired.
S. S. Fisher (3½ Norton sc.), retired.
A. Dover (6 Enfield sc.), cup.
T. G. Ellis (10 G.N.), cup.
C. Finch (10 G.N.), cup.

SUMMER TIME.

Aug.	14th	... ...	8.55 p.m.
,,	16th	... ...	8.50 ,,
,,	18th	... ...	8.47 ,,
,,	20th	... ...	8.43 ,,

Relics of a Former Life.

Many of the competitors in the recent Scottish Trials wore their tunics with pips and shoulder straps removed, while field boots, British warms, or trench coats were the common order.

Scooters in the North.

The North-Eastern Automobile Association contemplates the inclusion of a scooter event in the programme of its gymkhana, to be held near Newcastle in September, but to date the motor scooter epidemic has not reached the North. The present expectation that scooters will swarm like bees by September seems to be based on slender foundations.

A "Consolation" Prize.

Three prizes were offered by the Newcastle and District Motor Club for its August Bank Holiday run to Keswick. It is whispered that there was the keenest scrapping for the third prize, although the first and second were substantial accessories. The mystery is explained by the fact that the third prize was a bottle of "Black and White" whisky!

A Swiss Reliability Trial.

A reliability trial took place on the 3rd and 4th inst., passing through such well-known Swiss towns as Lausanne, Neuchatel, Basle, Zurich, Berne, Freiburg, etc., the total distance being 330 miles.

A Scott on Scottish Hills.

During a holiday in the Highlands Mr. W. H. Dovener, secretary of the Scott Motor Cycle Company, Limited, amused himself by trying his Scott and sidecar up most of the hills included in the recent Scottish Six Days. It speaks well for the climbing abilities of the Scott that his efforts resulted in clean ascents of most of the hills without shedding his 12 stone passenger. Mr. Dovener proposes making a sporting attempt with his sidecar outfit at the next Scottish Six Days.

French Road Race.

The Moto Club of France is organising the Circuit de l'Eure on the 16th and 17th inst. On the 16th a race will take place over a course measuring about fifteen miles, and will be confined to sidecars and cycle cars. On the 17th the motor bicyclists will race over the same course, but instead of covering twelve laps they will do fifteen. Two or three new two-stroke machines are entered. Among them are the Moto-Solo and the Bi-Temps. An Indian will represent America in the sidecar class, and a Morgan will uphold England in the cycle car class.

A motor cycle club has just been formed at Basingstoke, the first run being to Lee-on-the-Solent, when, as shown by the photograph, a very enjoyable day was spent picnicking by the sea.

Special Features.

HOW TO BUILD A MOTOR SCOOTER.
THE M.C.C. TEAM TRIAL.
NEW MODELS DESCRIBED.

Aeroplane v. Train.

Mr. Trevor T. Laker, the ex-competitio rider, who is giving aeroplane passeng flights in the Midlands, recently demo strated the advantages of the aeropla over train service by carrying a busine man from Coventry to Nottingham a back in less time than the single journe could have been made by train.

Helpers Wanted for A.C.U. Trials.

The Auto Cycle Union requires t services of expert observers for offici duties in connection with the Six Da Trials on September 15th to 20t Substantial expenses will be paid to ea of ten experienced motor cyclists. large number of voluntary helpers are al required. Those interested should co municate with the secretary, A.C.U., 8 Pall Mall, London, S.W.1, stating ful their qualifications and experience.

W D. Machines at Newcastle.

Recently thirty-five battle-scarred mot cycles were sold by Mr. James Coope auctioneer, at the Gosforth Aerodrom near Newcastle. The gross total realised w 1,177 guineas—an average of 33½ guine each. The top price was 71 guineas f a 4 h.p. A.J.S. and sidecar. Oth machines included Douglas, Triump Royal Ruby, and Invicta.

The Story of a Badge.

How an Auto Cycle Union handle-b badge saved a valuable sidecar out forms an interesting story. An A.J. combination was discovered at Rednal the Worcestershire police, and, their su picions being aroused, they got th detective instincts to work. An A.C. badge on the handle-bars had apparent been overlooked by the person wh they suspected had appropriated t machine, or had been left on so that might enjoy the facilities available motor cyclists displaying it. According the police took the number of the bad and communicated with the Auto Cy Union, asking for the name and addr of the member to whom the badge w issued. The information was immediat forthcoming, the member was approach by the police, and the machine was fou to be stolen, and at once returned to owner. Since all identification marks h been obliterated or destroyed, the ba alone offered a clue as to the right owner.

cottish Open Trial.

The Glasgow M.C.C. is holding a 100-mile open trial on the 23rd inst., for which entries should be sent to Mr. Frank Miller, 282, Woodlands Road, Glasgow, before Tuesday next.

The A.C.U. Six Days Trial.

The first three entries for the A.C.U. Six Days Trial, September 15th to 20th, have been received. These are from Cather Cooke (4 Triumph), private owner, and two trade entrants, J. Dosher and D. Guise (8 Enfield scs.)

Petrol Imports.

Petrol in big quantities reached this country in July last, the number of gallons imported being 14,419,829. The figures for the corresponding month in 1917 and 1918 were 12,346,846 gallons and 20,584,831 gallons respectively.

Stolen Motor Cycles.

On Wednesday, July 30th, a motor cycle was stolen from outside the Engineering Laboratories, Cambridge. It is a 1916 Harley-Davidson, engine No. M1286, enamelled grey, with discs and sidecar to match; blue upholstery with green cushion. Information that might lead to its recovery would be gratefully received by Mr. W. A. Fell-Smith, Magdalene College, Cambridge.

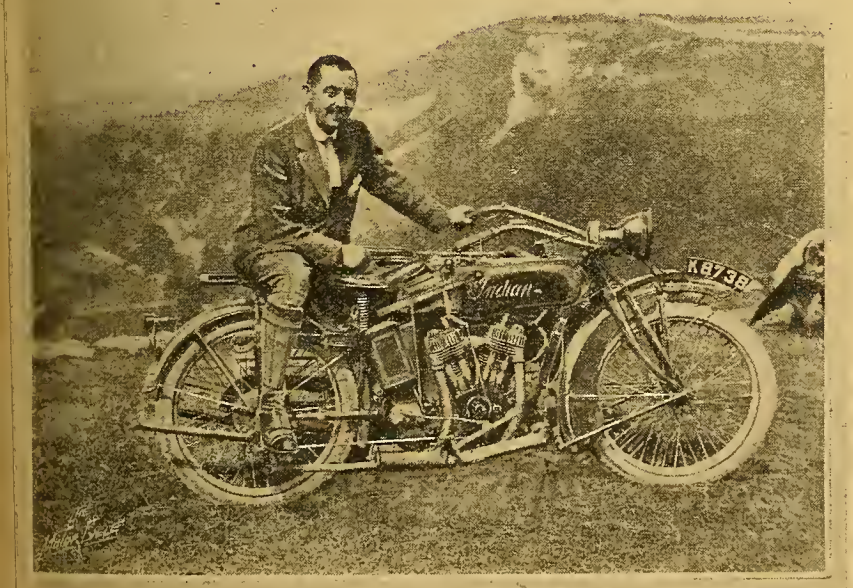
A 1915 B.S.A. chain-driven machine, with sidecar, was stolen from the premises of Mr. W. Pascal, of 51, Cambridge Road, Hammersmith, London, W.6, on August 1st, and £20 reward is offered for information leading to its recovery. Engine No. 10448, frame No. 10438, registration LH 298. The sidecar is a Douglas pattern, green body, coach-built, and underslung.

The Raleigh challenge trophy, East Midland Centre challenge trophy, and other awards in the tests organised by the Nottingham M.C.C. at Monsal Dale. The sidecar outfit is an 8 h.p. Campion originally designed as an ambulance.

Open Trial by Redditch Club.

The Redditch and District M.C.C. is holding an open trial on the 23rd inst., which is one of the events to be officially supported by the trade, and will include flexibility, brake, restarting, and "condition" tests.

Entries close to-morrow, the 15th inst., and should be sent to F. W. Viles, Headless Cross, Redditch.



A 1919 Indian, one of the first to arrive in England, ridden to the club meet at Monsa Dale by Noel H. Brown (hon. sec. Liverpool M.C.C.)

Speed Trials at Weston-super-Mare.

As foretold in last week's issue, the recent decision of the manufacturers to support certain open competitions has brought alterations in the programmes of several clubs. In addition to the Birmingham M.C.C. hill-climb, mentioned on page 182, there are other events which will be open, instead of confined to members, and certain abandoned competitions have been revived. Among the latter is the Bristol M.C.C., who will hold their open speed trials at Weston-super-Mare on the 30th inst. Trials entries close on the 23rd inst., and should be sent to Capt. Philip Grout, Keynsham, Somerset. The solo events include classes for 275 c.c., 350 c.c., 500 c.c., 600 c.c., and unlimited machines, and the sidecars 350 c.c., 500 c.c., and 600 c.c.

Imports and Exports.

The Board of Trade returns for July show that twenty-seven motor cycles were imported during that month, valued at £1,443. The importations of accessories, however, were of greater value than of motor cycles, being £3,008. During July last year the total value of both machines and parts was £171.

EXPORTS.

The value of machines as apart from accessories exported in July this year was £33,521. This is actually £1,000 less value than was exported in July, 1917. The number of completed machines sent out of the country, as will be seen by the table below, is actually 160 less than in the corresponding month of 1917. It must be admitted that these export returns are poor, and although there are many justifiable causes for such a poor showing, they will not hearten Overseas readers who are anxiously awaiting new British models.

	1917.	1918.	1919.
No. of machines ..	661	245	501
Value of machines ..	£34,786	£14,224	£33,521
Total value of machines, tyres, and accessories	£73,437	£66,984	£62,663

Club Rally at Monsal Dale.

A Well-attended Meet of East Midland Riders in the Peak District of Derbyshire.

FAVOURED by one of the brightest and warmest days we have had this year, the social run to Monsal Dale on the 10th inst., organised by the Nottingham and District Motor Cycle Club, associated with other clubs in the East-Midland centre, was attended by motor cyclists from all parts of the Midlands and surrounding districts.

Many had arrived by ten o'clock in the morning, and were soon at work with luncheon baskets and Primus stoves; at mid-day the riders from more distant places were coming in thick and fast, and either parked their machines at the Dale Head, or in the large field reserved for the various clubs.

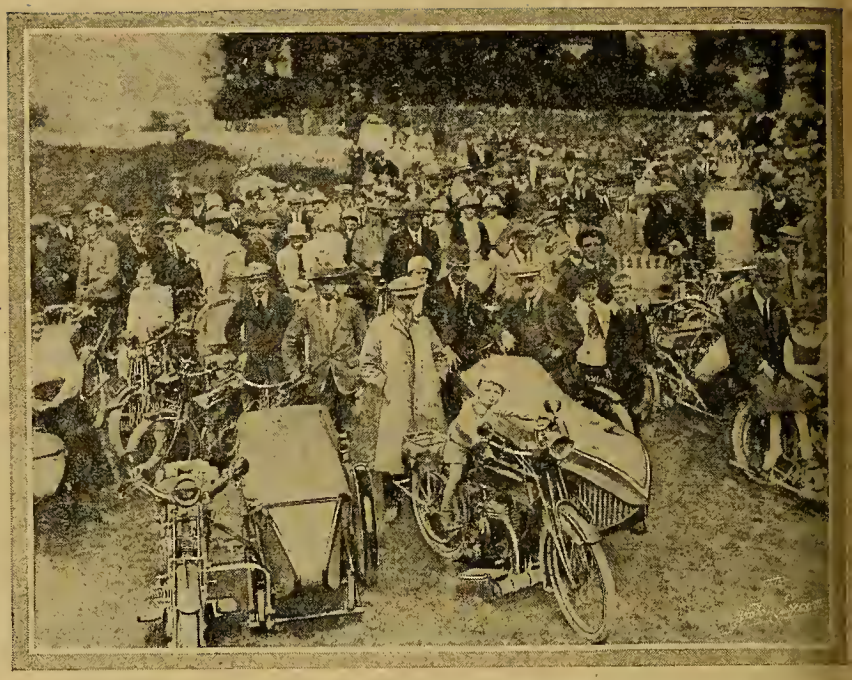
The Nottingham and Liverpool bodies were undoubtedly the best represented, but the Sheffield, North Derbyshire, Birmingham, Manchester, and Lincolnshire Clubs all turned up in force.

A Goodly Show.

Independent riders from Leeds and other places in West Yorkshire were also noticed, while from the South many had travelled from the Coventry district, all of which goes to show that these social meets, where a great variety of new machines may be seen and experiences exchanged, are very attractive to the unattached rider, as well as to the clubman.

The machines, as well as the splendid view from Monsal Dale Head, received much attention; indeed, one is led to believe that the average motor cyclist is keener to observe his neighbour's mount than the beauties of the landscape, and every model, whether new or old, came in for a critical examination.

Almost every class of machine was present, sidecars being in the majority,



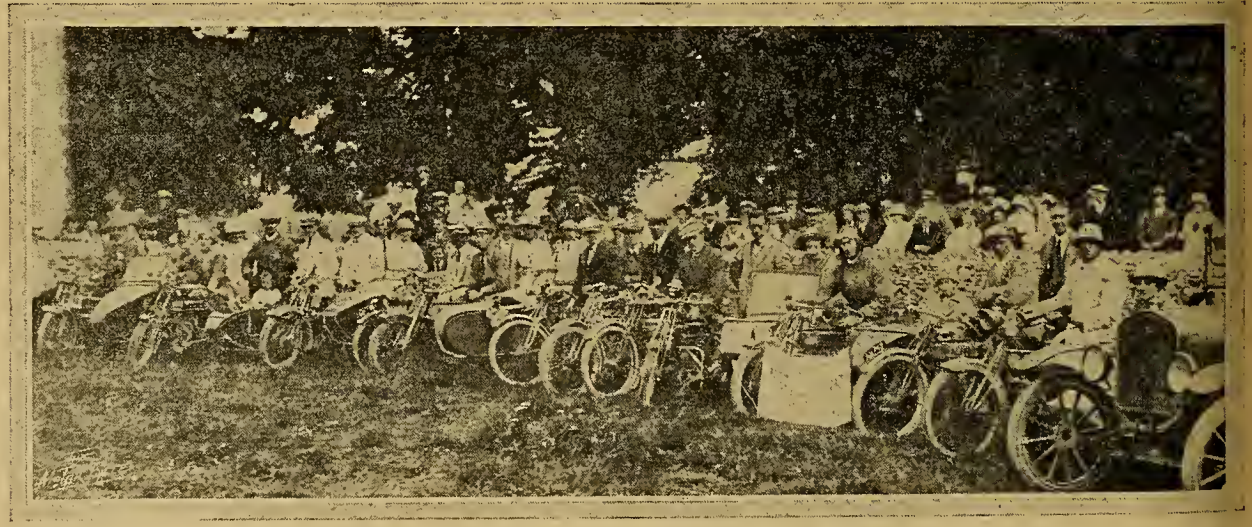
At Monsal Dale: a part of the assembly of machines and riders on the social run of the associated East Midland clubs. Over 300 machines were present.

and, while new models were fairly prevalent, only a few new designs were seen. The Skootamota, however, driven down by Dan Bradbury, of Sheffield, erstwhile exponent of big single-cylinder outfits, was a centre of much interest.

After the various clubs had all assembled a move was made for River Bridge, Ashford, were a competition for the Raleigh challenge trophy (held by the Nottingham Club) was held. The tests consisted of easy starting, slow running (free engine), silent running (free engine), and acceleration test (up-hill). Six classes were arranged, so that every machine entered could compete with an equal chance of securing the premier award, the Raleigh trophy, valued at 100 guineas, going to the rider gaining the largest aggregate of marks in the various tests. Other prizes were also offered for lady members and cycle car drivers.

Homewards.

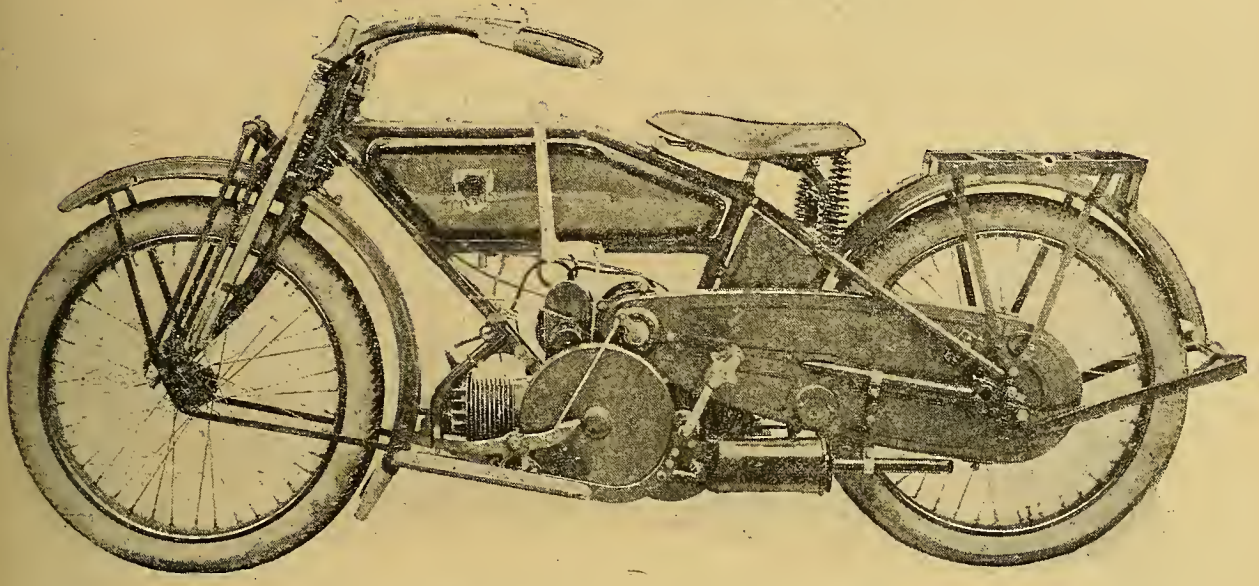
Various hill-climbing stunts were afterwards attempted on the rough and grassy Monsal Bank, and so the affair came to a conclusion and the riders dispersed in groups, and, one by one, in a dust cloud, the like of which could only be raised on the roads of Derbyshire with their finely powdered coating of white limestone.



Members of the Nottingham M.C.C. at Monsal Dale last week end.

THE HARLEY-DAVIDSON FLAT TWIN.

A 6 h.p. Engine, 70 mm. × 76 mm., 584 c.c.



The Harley-Davidson flat twin, from the transmission side, showing the enclosed single low speed chain, and the protected flywheel.

IN the new Harley-Davidson flat twin—the sport model, as its makers call it—we have a distinctly original motor bicycle, the popularity of which seems certain. It is not a lightweight, as it turns the scales at 257 lb., but is a handy two-purpose mount, which has sidecar lugs built in the frame, so it is evident that the manufacturers intend it to take two people if desired, while, being well balanced and not too heavy, it should make a comfortable and tractable solo mount.

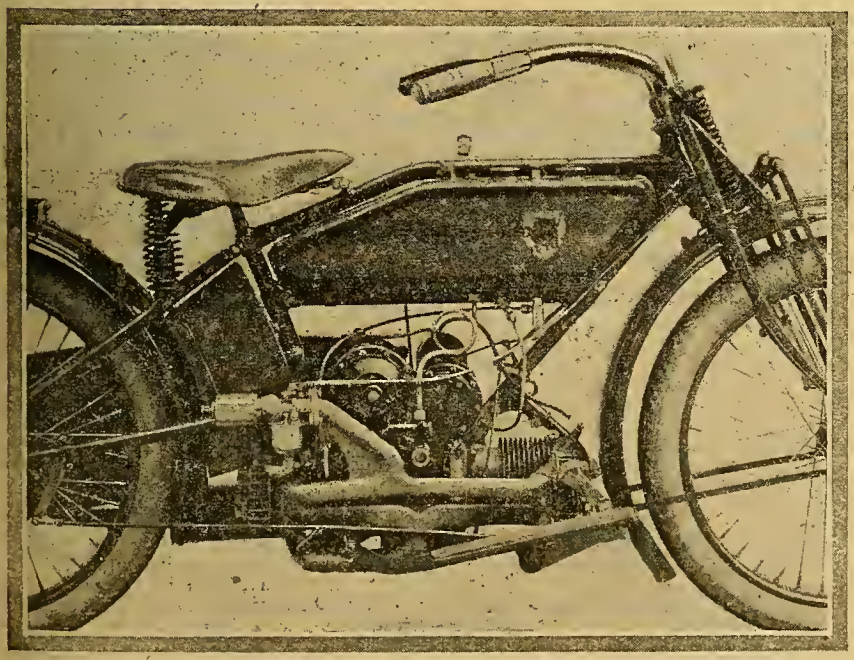
A Warmed Induction Pipe.

There are several attractive features about the engine. In the first place, both engine and gear box form a single unit, the latter being above the crank case, while another interesting point is the heated "twin-cast" manifold, which means that inlet and exhaust pipes form a single casting, a startling departure from standard motor cycle practice. The casting is held on to the engine by two nuts, and so may be easily removed, while the branch from the main inlet pipe to the carburetter is exhaust jacketed. It is this branch which is most liable to condensation, and as the jacket is of ample size and has a wide outlet pipe it should perform its intended function in a highly satisfactory manner.

The carburetter is a Schebler, improved by the addition of a cylindrical air filtering device, and gives excellent acceleration and slow running.

Roller bearings are employed throughout in the engine, those in the big ends being of large dimensions, and the crankshaft is counterweighted.

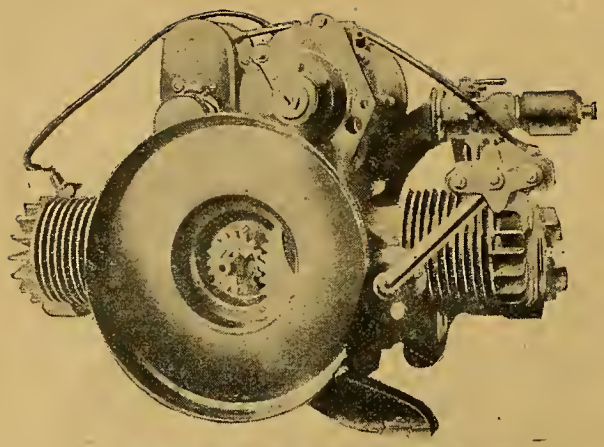
Side-by-side valves are employed, and these are staggered so that each set may be actuated by a common camshaft. The valve caps are provided with large cooling fins. At first sight the engine appears to be somewhat inaccessible, but really this is not the case, as the valves may be ground in without removing the power unit from the frame, and it is possible to remove the cylinders when decarbonising is necessary, though there is a stay to support the footboards in front of the engine, which would, at first glance, seem to prevent the removal of the front cylinder.



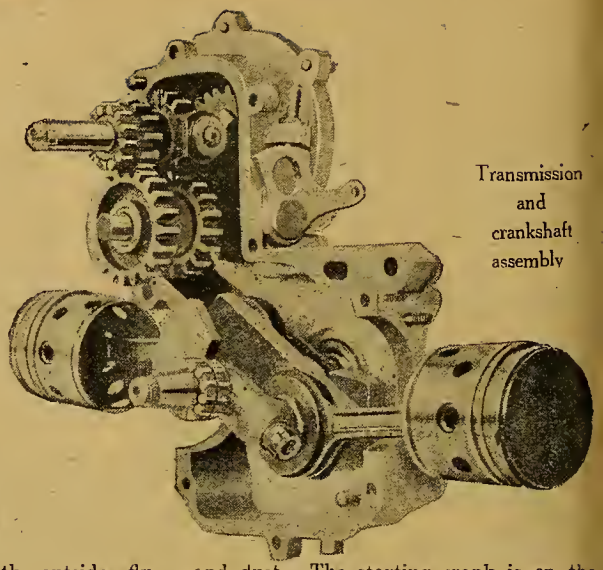
The Harley-Davidson flat twin, carburetter side, showing the "twin cast" intake and exhaust manifold.

Lubrication Details.

The lubrication of engine and transmission is effected by means of a plunger pump, which may be adjusted to feed more or less oil by lengthening or shortening its stroke by means of an adjusting screw, while a hand pump is also provided. This mechanical pump delivers oil directly to the transmission gearing, the clutch, and the crank case. Since the gear box has an open base leading into the crank case, the rotating crankshaft



The kick-starter and pinion with its protecting shield.



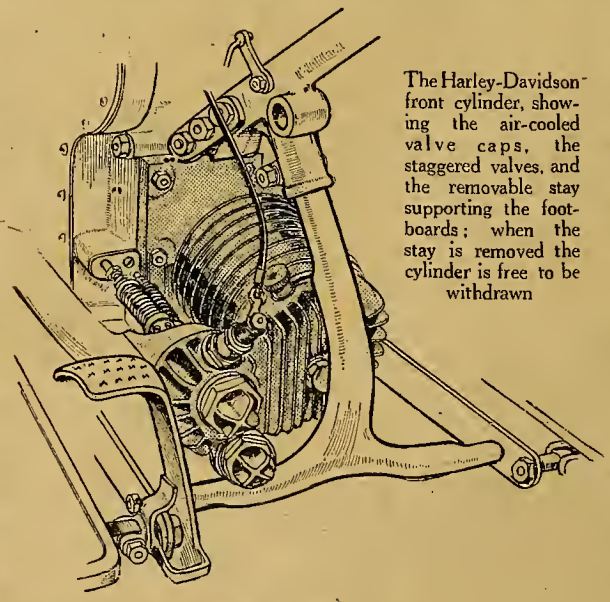
Transmission and crankshaft assembly

keeps the gears within bearings well supplied with lubricant. Oil reaches the timing gear case in the form of a mist through a rotary breather valve, formed by drilling ports in the secondary gear journal and the bearing in which it rotates. The breather pipe leads from the top of the spiral gear case direct to the chain case.

We now come to the transmission. A multiple-disc clutch, consisting of thirteen plates, is employed, which is designed to run in oil, and of these every other plate possesses composition inserts. Its adjustment is effected by removing a screw in the gear cover, which renders each adjustment screw for tightening a spring accessible in turn.

The gear box gives three speeds, which have the following ratios: top 5 to 1, second speed 8.33 to 1, and bottom gear 13.87 to 1. On one side of the power unit are the usual timing gear wheels, which work the valve gear, the Berling magneto, and clutch, while on the other side are spiral gears through which the transmission is conveyed. The whole idea is most ingenious and carefully thought out, as it allows the power to be transmitted to the rear wheel by means of a single low-speed chain entirely enclosed. Another excellent feature is the total enclosure of the flywheel, which is built up of steel plates, and it is consequently impossible for the Harley-Davidson flywheel to sling mud, an objection often levelled against motor cycle engines fitted with outside flywheels.

The kick starter quadrant engages a pinion on the mainshaft behind the flywheel, and when at rest reposes in a special protecting shield secure from mud and dust. The starting crank is on the left side of the machine.



The Harley-Davidson front cylinder, showing the air-cooled valve caps, the staggered valves, and the removable stay supporting the footboards; when the stay is removed the cylinder is free to be withdrawn

Frame and Forks.

The frame is of the usual diamond pattern; we say usual, as this is the most common type of motor cycle frame, but it is unusual when a flat twin engine is employed. A shield or shelf is placed between the bottom of the down tube and the saddle tube, on which the power unit may be rested when assembled by one man. There is a road clearance of 5½in.

A single brake is fitted on the rear wheel and is of the contracting type, 7in. in diameter.

The front fork is strongly constructed of round seamless steel tubing, and is of the castor type. Points of convenience have been carefully studied. The tank holds three American gallons of petrol, and two quarts of oil; the mudguards are 5in. wide, and the rear one has a removable section to facilitate tyre repair, and a special tool box is located behind the saddle tube.

Unfortunately, the Harley-Davidson Motor Co., Harleyson House, Newman Street, Oxford Street, London, W., is at present unable to make any statement as regards prices or deliveries.

The Birmingham M.C. Open Hill-climb.

THE Birmingham M.C.C. hill-climb on the 23rd inst. will be an open event after all. The decision of the trade to support twelve events, of which this is one, has resulted in this change of programme. The following classes are included:

CLASS 1. Singles and Twins (Solo), up to 230 c.c.—Expert and general.
CLASS 2. Singles and Twins (Solo) up to 230 c.c.—Expert barred.
CLASS 3. Singles and Twins (Solo) from 231 c.c. to 300 c.c.—Expert and general.
CLASS 4. Singles and Twins (Solo) from 231 c.c. to 300 c.c.—Expert barred.
CLASS 5. Singles and Twins (Solo) from 301 c.c. to 350 c.c.—Expert and general.
CLASS 6. Singles and Twins (Solo) from 301 c.c. to 350 c.c.—Expert barred.
CLASS 7. Singles and Twins (Solo) from 351 c.c. to 500 c.c.—Expert and general.
CLASS 8. Singles and Twins (Solo) from 351 c.c. to 500 c.c.—Expert barred.
CLASS 9. Singles and Twins (Solo) from 501 c.c. to 650 c.c.—Expert and general.
CLASS 10. Singles and Twins (Solo) from 501 c.c. to 650 c.c.—Expert barred.
CLASS 11. Singles and Twins (Solo), open.—Expert and general.
CLASS 12. Scooters.
CLASS 13. Sidecar Machines up to 400 c.c.—Expert and general.
CLASS 14. Sidecar Machines from 401 c.c. to 650 c.c.—Expert and general.
CLASS 15. Sidecar Machines over 650 c.c.—Expert and general.
CLASS 16. Three-wheelers.—Expert and general.

Awards include a special prize for the fastest time of the day, and for the best performance on formula, irrespective of class. In each class there will also be prizes for the fastest and the second fastest times, and for the best and second best performances on formula. An acceleration climb on formula only will be a feature of the programme, and will be open to all entrants without extra entry fee.

The entry fee in each class is 5s., and entries, which should be sent to Mr. T. Silver, Frederick Road, Stechford, Birmingham, close on Monday next, the 18th.

The formula will be: $\frac{W}{C \times t^2}$

A ROOMY SPORTING SIDECAR.

New Type of Sidecar by a Competition Rider.

A COMPETITION rider who has always been keen regarding the smart appearance of his machines is Mr. E. Kickham, the Bristol agent for Sunbeams and other well-known machines, who has for several years been developing a sporting sidecar on attractive lines, and giving a greater degree of comfort than the average small passenger attachment. This he has now introduced as the Dinky sidecar, and during the past few months quite a number have been seen attached to Douglas and Sunbeam machines in reliability trials.

A Practical Design.

As will be seen from the illustrations, the Dinky is very distinctive. The body is made of the best three-ply wood on an ash frame; the only metal panel used is that of the hinged dash. Streamline shapes have been carefully studied, and the result is proving remarkably effective. By placing the seat low in the body and providing good upholstery in the back and sides, really cosy and yet spacious accommodation is obtained. The tail contains a capacious locker, with ample room for two tins of petrol and other necessaries. No door is needed, as the passenger gets in from behind by a step placed between the motor cycle and the body. The curving dash is hinged so as to turn forward over the forepart of the body until the passenger is seated, when it can be turned back and locked in position; the resulting protection for the occupant is undoubted. Side pockets, footrest, and a thick foot mat are included in the specification.

The springing, by standard type of leaf springs, is very good. In the outfit illustrated the chassis is a Watsonian, with rear springing only. The body may be fitted easily to several different makes of sidecar chassis.

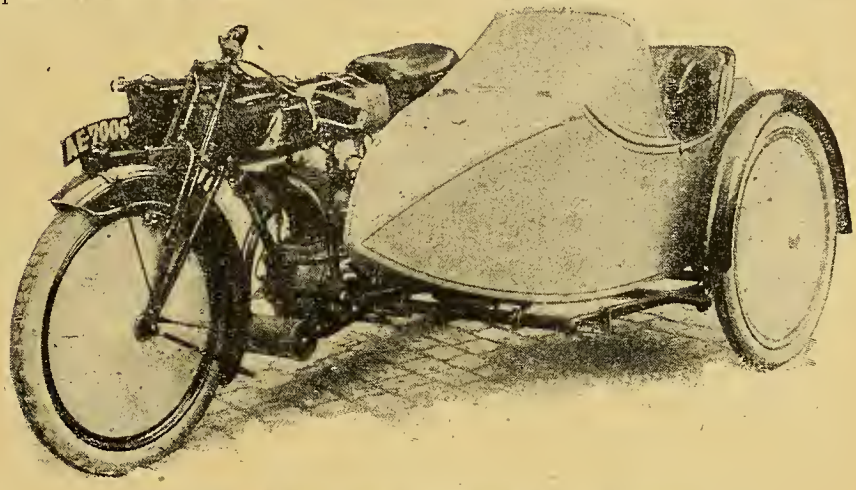
Four-point suspension will be standard. A removable hood can be fitted as an extra; with this addition the passenger is completely protected, and yet his vision is not obstructed to any great degree. To prevent the hood from damaging the coachwork when folded back a neat rest and strap are provided in the lid of the back locker.

A good range of colours is available: black or royal blue, with gold lining in either case, Indian red, and primrose yellow, as the one illustrated; the coach-painter's work is excellent.

This sidecar presents so many attractive aspects that one finds no particular point to criticise. Mr. Kickham, as may be expected, is experiencing a big demand. The price is not definitely fixed, and is likely to increase, but at present it is in the neighbourhood of £30.

The de luxe outfit illustrated, which aroused great interest at the recent Bristol Club Rally, is a specially finished 1920 Sunbeam and Dinky sidecar. The disc wheel covers match the sidecar, and the whole makes a very fine piece of work.

The new Sunbeam front fork, with laminated springing, is incorporated in this machine. This feature is being tested for the 1920 models.

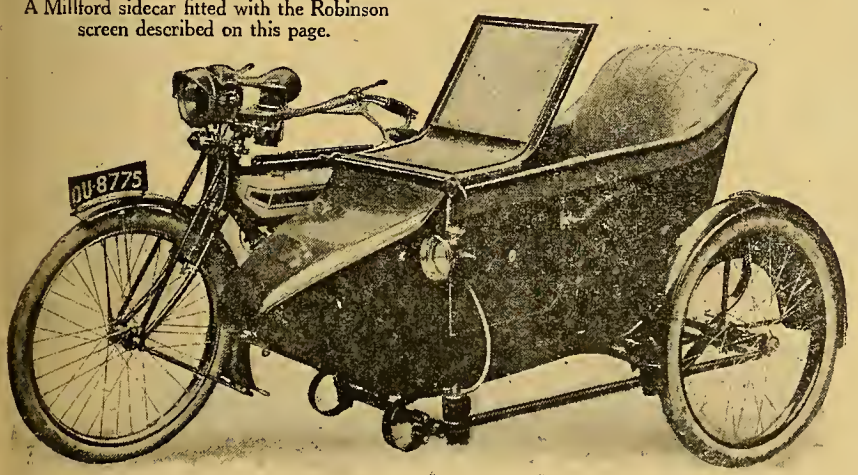


The Dinky sidecar, fitted to E. Kickham's 3½ h.p. Sunbeam.

A New Sidecar Screen.

THE Robinson sidecar screen consists of a wooden frame hinged in front of the sidecar door and curved upwards in any manner desired. In the back portion is a celluloid or glass window. The whole can be tilted forwards in a moment to allow the passenger to enter the sidecar, and, when fixed in position by the usual locking screw, it in no way impedes the movements of the driver. A patent (No. 14,133, 1919) has been taken out for this screen by Mr. F. T. Robinson, 29, Bramble Street, Coventry. Our illustration shows it fitted to a Millford sidecar attached to a 4 h.p. 1919 Triumph, and it will be seen that it harmonises very well with the conventioual coachbuilt type of body, while if fitted in conjunction with a hood, complete protection from the weather should be achieved.

A Millford sidecar fitted with the Robinson screen described on this page.



TAXI SIDECARS IN PARIS.

OUR contemporary *L'Auto* states that the much-talked-of Paris taxi sidecars have actually come into being. There is at the present moment one of these on the road—a 4 h.p. Triumph. As this is classed as a luxury vehicle it has no taximeter. It is fitted with a hood and screen, and the body is yellow with red lining. The owner-driver is, we are informed, amiable and courteous, and our contemporary says that "this novelty alone will assure him the best of success"

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

A MOTOR CYCLE CLUB FOR THE ROYAL NAVY.

Sir,—I have been asked to undertake the organisation of a motor cycle and cycle car club for the Royal Navy, and should be pleased to hear from any naval officer or rating interested. I shall welcome suggestions and offers from officers or men who are willing to give their services as club officials. It has been suggested that, in order to cater for all classes, the subscription to the club should be in proportion to the pay of the member.

E. S. K. EVANS-GREAVES, Lt. R.N.

DESIRABLE TESTS.

Sir,—I take it from an announcement of the Scott in your issue of May 1st, that the makers of this machine emphasise, more than anything else, the cool running and accelerating powers of their engine by ascending and descending Sutton Bank 100 times in 7½ hours.

Why do the other makers, such as Triumph, Norton, Rudge, Rex, Brough, A.B.C., etc., not follow their example and try to do it in a shorter time? An engine which could keep cool throughout this test is most suitable for the tropics. This test should be done by sidecar combinations as well as by solo machines.

Another interesting test would be a road race (as was done in November, 1917, between the Triumph and British Excelsior combinations) between the following makes: Norton and Triumph, Harley and Blackburne, Indian and Clyno, American Excelsior and British Excelsior, and so on.

Selangor, F.M.S. LOO YEW HOI.

THE ARBUTHNOT TROPHY.

Sir,—May I make use of your columns to express my gratitude to all concerned with the origin, development, and organisation of the Arbuthnot Trophy Trial? The committee of the A.C.U. are to be complimented on the way the trial was run, and on the lightning rapidity with which the results were made known. The whole trial was conducted on sporting lines, and, although many competitors had very bad luck, I never heard a grumble from anyone, even when the clerk of the weather was inconsiderate enough to drench us all on the first day.

May I also thank the manufacturers and motor cycling public who so generously subscribed for the trophy, and the magnanimity of the Motor Cycling Club in presenting a special prize?

I see the question has been raised as to whether the trial should be confined to officers only. This is a point which certainly deserves notice. I rather hesitate to express my own opinion without longer consideration, but I am sure the A.C.U. would be pleased to hear views on the matter.

In conclusion, may I urge *all* naval officer motor cyclists to support the trial next year? They will not find a more enjoyable way of spending two days.

E. S. K. EVANS-GREAVES, Lt., R.N.

Sir,—In view of the great success of the Arbuthnot Trophy competition, may I suggest that the A.C.U. organise a somewhat similar event for ex-D.R.'s? It might be made open to all N.C.O.'s and men who have been D.R.'s in any theatre of war. I think a one or two-day trial, held, preferably, at one of the holiday seasons, would attract a very good entry, and would be some recognition of the services of the motor cyclists in the war. From a social point of view, too, it should be a success, and many friendships formed in the mud of Flanders or on the sands of the desert might be renewed. If it is too late to organise such an event this year, it might be fixed for next spring.

I might add that I was one of the motor cyclists recruited by *The Motor Cycle* for the M.M.G.S., and hope soon to be demobbed, get a new 'bus, and send in my entry for the trial I have suggested. C. MANSFIELD (Pte.),

Calais. R.A.S.C., M.T.

BAKING THE SPARKING PLUG.

Sir,—In reply to "Ixion's" comment on the tip of heating the sparking plug to get an easy start in cold weather—issue of June 12th. I cannot claim to have reinvented the idea, but I owe it to the kindness of Mr. J. L. Norton, who is never dumb to an appeal for help. The reason for its efficacy, surely, is that when the blobs of unvaporised spirit are drawn past the inlet valve, they hit the hot plug and give gas just at the place where it is wanted.

(REV.) J. M. PHILPOTT.

"A KNIGHT ON WHEELS."

Sir,—I was a witness recently of a remarkable instance of how a motor cycle and sidecar were of invaluable assistance to a heavily loaded car in distress.

A brand new 6 h.p. A.J.S. combination was descending Kirkstone Pass towards Patterdale when it was overtaken by a Ford car—seven up—out of control, as its brakes were ineffective.

The car driver vainly endeavoured to avoid a crash with the A.J.S., but ran into the back of the bicycle, the near side front wheel of the Ford being between the sidecar and the cycle.

With great presence of mind the cyclist maintained his position on the road, and by gradually and forcibly applying his brakes succeeded in checking the runaway, finally reducing its speed sufficiently to permit of it being run into the bank.

Too much praise cannot be given to the cyclist—and his machine—for his courage and skill in such an emergency. Nothing would have been easier than for him to put on speed and have left the car to a certain fatal smash, as only by some miracle could such a result have been avoided.

The A.J.S. subsequently continued its journey, and when I left the scene the Ford was being made serviceable by its owner. J. D. N. FOREMAN.

SPARE PARTS.

Sir,—It is with deep regret that I feel it my duty to make it known that, although we have returned to times of peace, certain firms are shockingly careless about their supply of spare parts, and well-known makers at that.

I have a 4 h.p. motor cycle. On May 26th, one of the connecting rods came adrift, and punched a hole in the top of the crank case. My agent at once sent away to the makers for new parts; they were invoiced and paid for by June 2nd. On June 20th, the parts arrived, but the wrong part of crank case was sent (the magneto base). There was really no excuse for this error, as the makers had the damaged part itself to go by. The wrong part was at once returned, and the error explained. Since then neither my agent nor myself has been able to get a word from the makers, although we have both made repeated enquiries by letter and telegram.

My machine has now been "in dock" for ten weeks, owing, as far as I can make out, to the carelessness of the firm concerned. I am now stranded here, waiting to go south on the machine, and still not a word from the makers. I have appealed to the A.A., and I am sure it will do its best for me.

Newport, Salop. EX-SERVICE MAN.

ELECTRIC LIGHTING.

Sir,—When I say I was extremely interested in Lt. R. B. Whittick's suggestion of a complete set suitable for electrically lighting a motor cycle, I am sure I am voicing the opinion of hundreds. I hope "Ixion" or some of his useful sort will not let it rest till it is an accomplished fact.

If some arrangement could be incorporated whereby the drive could be temporarily thrown out of gear when not required, I think it would be an advantage.

Stoke-on-Trent. W.H.M.

SPRUNG LUGGAGE GRIDS.

Sir,—On reading your Overseas Section of July 31st, page 110, we note the desirability of a well sprung luggage grid. May we point out to you how this is obtained on the Rudge sidecar? An angle-steel sub-chassis is bolted to the main body supports, and carries a luggage grid at its rear end, which therefore enjoys the same amount of springing as the body itself, and the luggage rises and falls with the body. Eggs have been carried on this carrier without damage. Going to the other extreme, three full tins of petrol and several suit cases have also been carried without overtaxing the springs, or detracting from the comfort of the passenger. The mudguard is also attached to this sprung sub-chassis, and in consequence the absence of mudguard rattle and luggage grid vibration is very noticeable, and much appreciated by those who use the Rudge sidecar.

RUDGE-WHITWORTH, LTD.

ENGINE DESIGN.

Sir,—I read with interest "Entente's" remarks on inside and outside flywheels in your issue for July 31st. I also refuse to accept the blind assertion of the superiority of the outside flywheel.

A large diameter outside flywheel with its weight concentrated in the rim would score, in point of weight, for the same flywheel effect. But the diameter is limited by the allowable over all height of the engine and the necessary ground clearance. The latter should be greater owing to the off centre position of the flywheel. The rim must also be kept narrow owing to its position. Add to this the disadvantage of the rapidly rotating disc in the vicinity of one's trousers, with its oil and mud-throwing properties, and the overhung weight on the engine main bearing, and the outside flywheel has little to recommend it.

The real reason for its adoption on two-strokes is obvious. It is the only means of keeping the crank case volume small enough to get the necessary compression pressure. Simple calculation, or inspection of the interior of, say, a Scott crank case, will verify this.

In the case of the flat twin similar reasoning applies. The necessity of keeping down the over all length of, in any case, a long engine, and the accommodation of a two-throw crank, makes an inside flywheel impossible.

Erdington. TWO-STROKE.

Sir,—Again we have some discussion on flywheels! "Entente's" idea is excellent, and if the makers of a well-known 8 h.p. outside flywheel engine could be induced to explain why they key a flywheel to the crankshaft and then drive from the flywheel, thus throwing the whole strain of the drive on the small key, it would no doubt be of great interest to owners of these machines.

Personally, I have had endless trouble with keys on outside flywheels and none with inside flywheels.

JAMES MAXWELL.

THE FOUR-SPEED MORGAN.

Sir,—Some doubts have been expressed as to whether the four-speed Morgan, which, driven by a private owner, won all the premier awards in the M.C. and A.C. trial ("the greatest trial of the year"), was a standard type.

There is no question about it. The four-speed model has been included in our catalogues, and, although through stress of work at the present time we are compelled to confine ourselves as far as possible to the manufacture of the simpler models, it will certainly appear again in our catalogues and advertisements. There are a considerable number of these machines on the road—probably more than the number of standard machines of some other makers. For ordinary purposes we consider two speeds amply sufficient, but some of our riders require more, and we have endeavoured to meet their requirements by a simple device which duplicates the gears.

MORGAN MOTOR CO., LTD.

VARIABLE GEARS AND BELT WEAR.

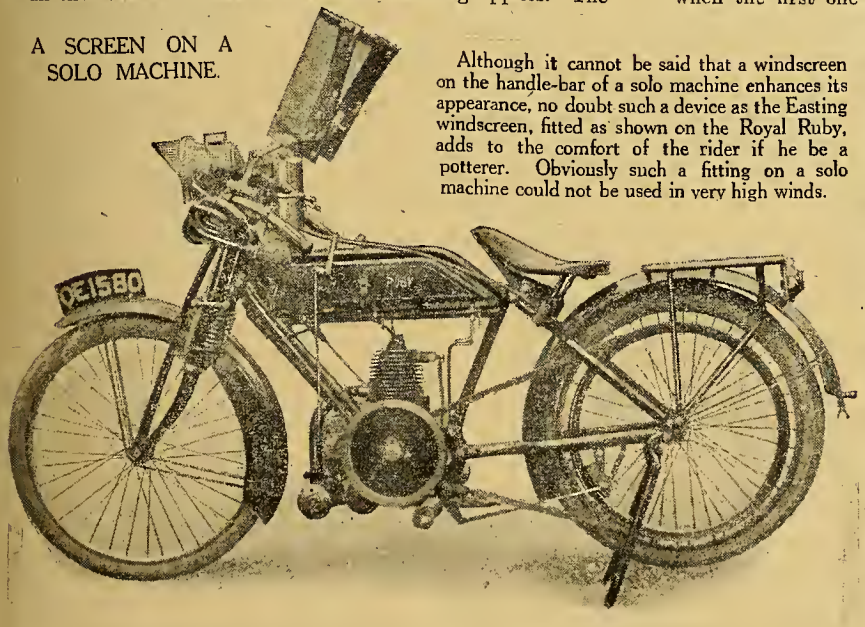
Sir,—At the present time, people who have never given motoring a thought, and others I know who have gone so far as to condemn it, are rushing into the motor cycle agents and also buying privately every class of machine on the market, and asking all kinds of strange questions, especially regarding the Gradua and multi gears on Zenith and Rudge machines. I was told by many old riders when buying my latest mount—a 1919 Rudge—to think of the belt wear, and many other things. But why the belt wear? I have in the past covered many thousands of miles on a 6 h.p. Zenith with sidecar, 4-5 h.p. solo, and 5-6 h.p. Rudge, and have never found this trouble of 500 miles on a belt. A 6 h.p. Zenith and sidecar with Pedley belt will last a good 4,000 miles if the gear is used in the way the makers advise. Solo on 4-5 h.p., I used two belts only in 11,000 miles, and when the first one was put aside it still had life in it for a spare, and the machine was sold with the second one still going strong. So if anyone is considering buying a variable gear machine, do not let belt wear trouble him, and also remember it is only the belt which has any serious wear which can be replaced at small cost. I have a friend who did a much greater mileage than the above, and he is a man that moves "some" on the road, and has climbed many hills in Wales and Devon with a sidecar.

I was at "Wisley Hut" some Sundays ago, and noted a Zenith rider doing his best to wear out a new belt, by getting into the saddle and top gear at the same time. Evidently he had not studied the makers' handbooks.

This year looks like being the greatest motoring year we have yet seen, and I hope something will be done quickly with the bad roads, for which the motoring public pay so much to keep in repair; also that the police will not try to pay for this war out of fines by unnecessary trapping; they are starting their old tricks in many fresh places already, and the year is still young. It is up to all motor cyclists to join the A.C.U. or A.A. for the protection which only combined action can ensure.

London. RUDGE-MULTI.

A SCREEN ON A SOLO MACHINE.



Although it cannot be said that a windscreen on the handle-bar of a solo machine enhances its appearance, no doubt such a device as the Easting windscreen, fitted as shown on the Royal Ruby, adds to the comfort of the rider if he be a potterer. Obviously such a fitting on a solo machine could not be used in very high winds.

PILLION RIDING.

Sir,—Mr. A. C. Robbins's spasm in your issue of 24th ult. is instructive to the last degree, but possibly he would be interested to hear the opinion of an expert "flapper bracket" merchant of many years' standing.

A friend of mine was unfortunate enough to smash his machine up the other day, and for three weeks I have had to take him to business on my carrier in all weathers, as he lives some miles out of Birmingham. As far as tramlines are concerned, I find that a pillion passenger considerably stabilises the machine. I can take the lines at the finest angle and even ride in them. As far as steering goes I can ride "hands off." My brakes act far better, and there is not nearly so much liability to skidding when suddenly applied on a greasy road. "A.C.R.'s" sweeping remarks about pillion pilots acknowledging the danger of such a practice are unfounded as far as my acquaintance of the motor cycling pillion pilots goes.

If your esteemed correspondent will meet me on the Bristol road one day I will undertake to drive him along as many tramlines as he likes, just to show him how it's done!

In conclusion, I should like to mention a little episode on the Ashford-Canterbury road in July, 1914, when I came across the Bishop of Croydon, whose two-stroke had given up the ghost miles from anywhere, and I had the honour of taking him some eight miles to his destination, where he had an important engagement—on my deadly "flapper bracket."

Birmingham. NEPHELOS.

Sir,—I have read two paragraphs in the *Daily Mail* of July 29th with reference to the above, giving particulars of the violent deaths of two human beings. May I ask when this senseless and criminally dangerous practice will be prohibited? HAROLD KARSLAKE.

Sir,—I have read with much interest the articles and letters in *The Motor Cycle re* pillion riding. My husband and I have covered some hundreds of miles in this manner without the slightest mishap, and the whole secret of "safe" pillion riding lies in the fact that the passenger sits astride. Side saddle seating is not safe—it upsets the steering and distracts the driver. By sitting astride a perfect balance is maintained, and there is no need to clutch the driver by the waist.

Many people cannot afford a sidecar outfit, or the garage for one, and should pillion riding be stopped, because a few "would-be speed merchants" and absurdly dressed "flappers" have met with mishap, it will constitute a real hardship for those who understand the art of pillion riding.

IVY BRODIE.

Sir,—Your correspondent A. C. Robbins, in his letter *re* pillion riding, is talking through his hat. I do not wish to be rude, but opinions like these make me sick.

By his own letter, he does no passenger-carrying himself, as he goes by the words of a lot of old insurance fogies, who have probably never ridden (I nearly said "seen"!) a motor cycle. Wherefore then does he use such sweeping expressions as "most dangerous" on a subject he knows nothing about? Let us take his points.

(1.) "The balance of the machine is totally upset." This is utter bunkum. The balance is not upset to anything like the extent that it is in the average sidecar. We hear no outcries to-day against the sidecar, though we did umpteen years ago, and, umpteen years hence, A.C.R. and Co. will have come to their senses regarding pillion riding and be exerting their restrictive efforts on some other branch of the sport, probably aeroplanes!

(2.) "The steering is slower." I do not understand what he means.

(3.) "Tramlines at acuter angles." What has the pillion passenger to do with tramlines? The angle at which one can cross tramlines depends only and entirely on the amount of traffic about.

(4.) "It is unresponsive to brakes." Just the reverse. One can put the brake on a *great* deal harder with a passenger on, without skidding the back wheel, and more than compensate for the extra weight.

(5.) *Re* the "flapper." I will suppress the obvious retort.

I have never yet seen a sound theoretical or practical reason why pillion riding should be "extremely dangerous." I have seen and heard of any number of sidecar accidents, but have never seen and rarely heard of an accident directly due to a pillion passenger.

If A.C.R. objects to pillion riding he ought to come to Cambridge and see 8 h.p. solo machines burbling around the town with a fellow on the tank, another on the saddle, and two on the carrier. (How they all stick on puzzles me!)

I do not think anyone minds sensible discussion, however extreme, but letters like A.C.R.'s are "calculated to be prejudicial to the allied cause"—in English, to encourage a narrow-minded Government to heap still further restrictive legislation on the finest but most oppressed pastime going. There is no law compelling A.C.R. to carry a passenger on his pillion if he does not want to, and for him to encourage a prospective law—which would spoil the sport for thousands of others—for purely theoretical reasons, is pure and criminal selfishness.

I may say I do not often carry a pillion passenger myself, but, when I do, I do not find it upsets the control of the machine to any appreciable extent.

I hope A.C.R. has read the letter printed after his, signed with an extremely true and appropriate motto, "Live and let Live." DUGGIE.

Cambridge.

SIGHT FEED LUBRICATORS.

Sir,—Referring to the article by "Ixion" on the fouling of sight feeds, I would point out that the detachable dome lubricator made by Messrs. Benton and Stone, which you see fitted to various well-known machines, is a perfectly satisfactory article. When the glass dome gets discoloured or dirty it can be taken out in a moment and wiped perfectly clean inside, when it is equal to new again, and the dripping from this dome can be seen practically in any position. The merits of this device seem so obvious that it is difficult to see why it does not become universal. C. BINKS.

THE SCOOTER DEFINITION.

Sir,—I have read the A.C.U. definition of a scooter, and cannot for the life of me understand what is meant. It says "the centre portion of which platform shall, for not less than twelve inches in length, be the uppermost portion of the frame." If by "centre portion" is meant the footboard on which one stands, or rests one's feet; if fitted with a seat, surely this cannot possibly be the uppermost portion of the frame? What about the supports of the motor, tank, and is not the steering post part of the frame? Is the saddle post (if a saddle is fitted) to be under the "centre portion"?

I think everyone interested agrees with you that a limiting definition becomes desirable, but for goodness sake let us have no mere conglomeration of words which "no fellah can understand."

I have failed to come across a single man who has not failed to explain to me what is intended to be the meaning of the words I have referred to. Perhaps the A.C.U. will oblige by explaining.

The other portions of the A.C.U. definition seem very reasonable, but I certainly think it should be more concise as to the frame. PUZZLED.

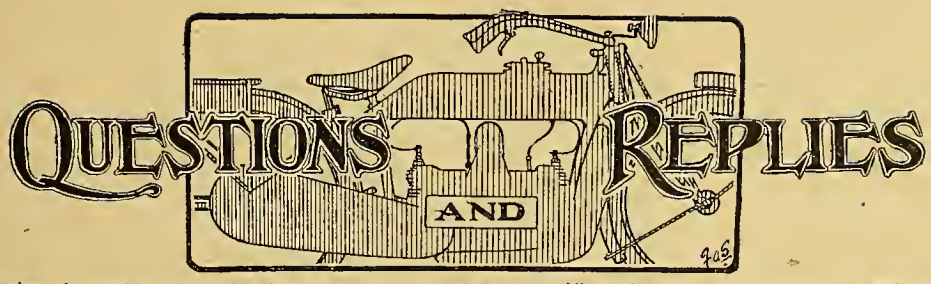
London, N.

[We understand the definition to mean that for a length of twelve inches no part of the frame may be above the footboard; in front and behind this there is no height limit.—ED.]

Useful Books and Maps for Motor Cyclists.

	Price net.	By post
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case	4/6	4/10
"HINTS & TIPS FOR MOTOR CYCLISTS." Full of useful "wrinkles" and little items of sound advice on the management, repair, equipment, and general care of a motor cycle. It will be found invaluable to all those who are thinking of overhauling their machines. *Sixth edition (2nd reprint)*	2/-	2/3

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Peugeot Engine.

I have an old machine with automatic inlet and am requiring a new piston for replacement. Unfortunately, there is no name on it as to make or place of origin, except that it has P.F. cast on the crank case. Do these letters convey anything to you?—E.F.D.

The engine in your machine is a Peugeot. We doubt whether you would be able to obtain spares, but it is likely that a piston can be turned to suit your cylinder. Any good local garage should be able to do this for you.

A Road Race.

I intend to organise a motor cycle race on a local holiday, but I scarcely know how or where to start. (1.) There are plenty of machines in the district, but of all makes and horse-power, and some rather ancient. Can you give me some idea as to handicap? (2.) Can you tell me what steps to take to satisfy the authorities?—W.B.

We fear it will be impossible for you to organise a motor cycle road race, as, under no circumstances do the police authorities permit this kind of event in England.

The Scott Two-stroke.

I have just purchased a new Scott motor cycle and find it rather a novelty after fourteen years of single and twin four-stroke machines. An article appeared in your valuable publication by a Scott owner some considerable time ago, and I would be indebted to you if you could give me the date and number of issue in which this article appeared. You might possibly refer me also to other information which has appeared in *The Motor Cycle* which would be useful to me. I have back numbers since 1905.—W.J.S.

As you say, the Scott is certainly a novelty after long experience of more ordinary types of machines. We do not know exactly to which article you refer, but various notes on the running of recent Scott machines appeared in the following issues of *The Motor Cycle*: September 14th, 1916, page 223; February 22nd, 1917, page 173; March 1st, 1917, page 200; May 10th, 1917, page 430. Earlier references to the Scott machine would probably be of very little use to you, as the carburation and lubricating arrangements of the latest type of Scott are quite different from previous models.

Lack of Power.

I have a $2\frac{3}{4}$ h.p. Sun-Villiers two-stroke which seems to have lost all its power; as I start up the engine runs *fairly* well, but directly I put my weight on the machine it pulls up. The sparking seems to be quite all right. I have just had the magneto overhauled. I might mention that I have lately had the engine down and cleaned it, also that blue smoke is puffed out through the carburetter.—F.W.

Since you appear to have decarbonised and generally overhauled your engine, it is rather difficult to diagnose your trouble. Possibly the engine is suffering from lack of oil, spark insufficiently advanced, or maybe the piston rings are tight in their grooves. Very often, after dismantling and reassembling an engine, for the first few miles the power is noticeably less than normal, but it generally returns after a little running. Of course, we assume that the piston has been replaced correctly, *i.e.*, with the deflector nearest the transfer port.

Automatic Inlet Valves.

I have recently purchased a 6 h.p. twin Rex, automatic inlet valves, and it is very difficult to start. It goes about a couple of miles, then, after a series of misfires, it conks out. It has a B. and B. carburetter, Bosch magneto, the jet in the former being No. 26. I should like your advice as to what might be the trouble; there is also a continuous spraying of petrol from the air intake of the carburetter.—J.H.C.

It is very probable that your machine falls off in power after a certain distance through the petrol level being too low or to a partial stoppage in the petrol supply. We suggest that you verify these points. For easier starting, try fitting a larger jet, also eliminate all air leaks between carburetter and induction pipe. The blow-back through the carburetter is common to old type automatic inlet valve engines. You might effect a partial cure by fitting stronger inlet valve springs.

AT THE OLD SMITHY, COCKINGTON VILLAGE.

Paignton was the venue of the opening social run of the Plymouth and District M.C. Club. In spite of showery weather a number of members made the run, returning through some of the old world Devonshire villages.

Tubing for Exhaust Pipe.

I should be much obliged if you could tell me where I can obtain exhaust piping for motor cycle.—G.A.S.

Any good cycle agent or local garage should be able to supply you with light gauge weldless steel tubing, suitable for an exhaust pipe.

Broken Connecting Rod.

Having had the misfortune to break the connecting rod of my 1914 3½ h.p. Sunbeam, I have ordered a new connecting rod and crank pin, with rollers, from the makers, but find they cannot supply for some time. Is it safe to trust a repairer to make new parts?—E.S.K.

You might have the broken connecting rod welded if it is a clean break not affecting the bearing parts. We should advise you to submit it to one of the first-class welding firms who advertise in *The Motor Cycle*.

Piston Ring Trouble.

The compression of my engine varies—sometimes it is very good, and sometimes very bad. The valve tappets are adjusted correctly. (1.) Do you think that the piston rings work round till the slots are opposite? Then compression is bad until they have worked further round again. (2.) If the rings were too loose in the grooves, would this cause them to work round easily? I might mention that after running about six miles I cannot bear my hand on the crank case for heat.—A.J.R.

(1) It is most probable that the piston rings are working round so that the slots come opposite each other. (2) The above seems more than likely, since you state that the crank case becomes abnormally hot. We should advise you to obtain oversize rings from the makers.

Fitting a Magneto.

(1.) I recently bought a 2¾ h.p. Kerry, which, I fancy, was originally a battery machine, but fitted by its late owner with a Thomson-Bennett twin magneto. One of the segments was ground off to suit a single cylinder. Could you kindly inform me if there is any advantage in connecting one of the high-tension cables to the frame? Could not this cable and brush be removed? (2.) I recently fitted a cut-out from the magneto to the handle-bar switch, with the desired result. Is there any injury to the magneto from this, say, if the machine be wheeled backwards, as I have heard such is the case?—A.S.

(1.) If one of the segments is completely removed from the contact breaker, there is no necessity to connect the corresponding high-tension cable to the frame of the machine, and consequently the carbon brush could well be removed. (2.) If the magneto switch is properly fitted, *i.e.*, to the special terminal provided on the contact breaker cover, no damage whatever can result to the magneto itself, although indiscriminate use of the switch as a means of control when running is apt to throw sudden and severe strains upon the engine and transmission.

Valve Cams.

(1.) What is the valve setting for 4¼ h.p. Calcott engine, 1913 model? (2.) The valve cams are not alike in this engine. One cam is sharper than the other. Which is the inlet?—A.J.L.

(1.) The valve setting for your engine is as follows: With the piston on top dead centre, set the exhaust cam so that the valve is just closing, and the inlet valve just about to open. (2.) Of the two cams you describe, the one with the sharper profile is the inlet cam; the one with the flat top is the exhaust.

Two-stroke Rattle.

I have a two-stroke which makes an annoying rattle at fairly high speeds; but when I open it "all out" the rattle gradually stops, and only the deep hum of the exhaust remains. I have recently cleaned the engine. I may say that the rattle is not regular, but comes and goes, now louder, now more silent. I am sure that the sound comes from the engine, yet the engine always has a good healthy note, apart from the rattle. Could you tell me the cause and cure of this?—D.J.

The rattling noise of which you complain in your two-stroke engine is common to the type. No satisfactory explanation has yet been discovered, and if the engine runs well we do not think there is any cause to worry about it. If the noise becomes excessive, however, and is accompanied by unpleasant vibration, especially when running fast down hill, we should advise you to examine the bearings, more especially the big end of the connecting rod, and have this taken up if at all slack.

A Damaged Fork End.

I was rather unfortunate the other day in losing a nut off the back spindle of my 4 h.p. Bradbury; the consequence was the cones seized, and the whole spindle revolved inside the back lugs, wearing the spindle nearly through, and also one of the lugs of the frame was worn upwards about a quarter of an inch. I have had a new spindle fitted. I have been to two different motor firms; one said it was unsafe to ride, and the other said I had nothing to fear, as the lug simply held the wheel in position and there was practically no weight on it, also that it had not worn so very much. (1.) Will you please tell me whether it is dangerous to ride it in this condition, as I nearly always take a child passenger on the back? (2.) If it is fairly rideable, but weak there? (3.) Could you give me any suggestion in regard to strengthening it or the repair of it?—A.F.

(1.) We do not think that the machine is actually dangerous to ride in the condition you describe, but, of course, we cannot speak very definitely on this point, not having the machine before us. (2.) It is certainly much weaker than it was before. (3.) There is apparently no way of strengthening the worn part, and the only satisfactory repair would be a renewal of the lug, but large washers on the spindle might be temporarily effective.

Balance.

My motor cycle, a 1914 6 h.p. model, has always vibrated badly, so much so that I always feel upset after a run of any length. I have dismantled the engine, and tried the balance as per "Motor Cycles and How to Manage Them." I followed the instructions most carefully, and I find that, in addition to weight equal to half of the reciprocating masses (which is 1 lb. 14 oz.), I require to add another 2 lb., which practically means that the balance is just suitable for rotating masses only, and nothing seems to have been allowed for the pistons, gudgeon pin, and small end of connecting rod. Please advise me what to do? I took off the connecting rods, and tried the flywheels and crank pin alone. This took ½ lb. hung on to the crank pin to balance, which equals the large ends of the connecting rods. I hesitate to alter the flywheels to the extent of 2 lb. without advice, so I hope you will oblige. I am quite satisfied with the machine in every way, except for this vibration.—E.R.

For a 50° V twin engine the balance weights on the flywheels may be arrived at by taking one and two-thirds the weight of one piston and rod, and adding this to the combined weight of both the big ends and the crank pin. It therefore appears from your figures that at least 1½ lb. extra weight is needed. We should advise you to take up this matter with the makers.

READER'S REPLY.

Faulty Three-speed Hub.

If your correspondent "A.D.H." can once get his gear in order, and, better still, learn to take it apart himself (as the planet pinions want renewing occasionally), he should have no trouble if he uses a low top gear. I found 5¼ best for my 1913 Triumph; also check control lever rod occasionally, and, most important of all, lubricate with sperm oil every time you use the machine.—H.L.C.

"The 'Mobile Pup' can truthfully be described as an engineer's job from first to last, and is one of the nearest approaches to our own ideas of the true scooter."

Thus say "Motor Cycling" in their issue of July 30th, and the keen enthusiasm evoked everywhere by

THE "MOBILE PUP" Motor Scooter

is striking proof of the public's appreciation of this truly efficient "engineer's job." We are

Sole Distributors

Berkshire, Buckinghamshire and Oxfordshire

and invite enquiries over that area from Traders interested regarding sub-agencies covering a period from present date until end of 1920 season.

We also welcome enquiries from prospective private buyers who can, whenever sub-agencies are arranged, eventually be supplied through their Local Agent.

The "Mobile Pup" is the outcome of a concentrated and prolonged experience and, amongst many other feats, has demonstrated its utility and reliability by easily climbing Sunrising Hill with its 1 in 6 gradient.

Note a few actual details—

Engine.—Bore 55 mm., Stroke 60 mm. Air cooled, overhead valves, detachable cylinder head, oil retaining. Easily accessible.

Carburetter.—Single lever. Twist grip control.

Ignition.—Magneto.

Transmission.—Front wheel drive with shock absorbers.

Wheels.—Steel disc type 18 x 2½.

Tyres.—Palmer Cord.

Control.—By twist grips on control column which folds down when not in use.

Mudguarding.—Exceptionally efficient with deep valances.

Finish.—French Grey Stove Enamel.

Road Speed.—Up to 20 m.p.h.

Petrol Consumption.—About 125 m.p.g.

Weight.—68lb. only.

PRICE.—30 GUINEAS, complete, including front and rear electric lamps, Tyre Inflator, Bell, Tool Kit, Number Plates, and ready for the road. The price also includes a 12 months' free comprehensive Insurance Policy.

Deliveries commence in about 2 weeks' time, and all orders will be executed in exact rotation as received.

Remember Layton Garages' reputation for courteous, personal and reliable service and send YOUR enquiry through without delay.

NOTE.—After careful examination and extended trial we thoroughly approve the general details of the "Mobile Pup."

BOOT

REPAIRING

"Elite Holdtite Rivetless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

Miscellaneous

YOUR attention please!!

IF your address is within two hours of London and you want to sell your car or motor cycle privately, we can find you a purchaser for a very small com-mission. Send a P.C. for our terms, and you will be satisfied. No dealers.

WE also invite anyone who wants to purchase a second-hand car or motor cycle privately to come and see our list of private sellers, which is now extensive. All who have been to see us go away pleased with our new method of putting private purchasers in touch with private sellers.

WE are only three minutes' walk from South Ken-sington and Brompton Road Tube Station.

WE can only reply to intending sellers, who should write to Box 1, c/o The Lennox Cycle and Motor Co, 32, Fulham Rd., S.W.3. [8183

LANCASHIRE'S LEADING AUTOMOBILE DEALERS

Motor Houses and Cycle Sheds.

Built in five sizes, the three largest sizes made in sections which are mortised and tenoned together, a method of manufacturing which few makers adopt, but it will be evident to anyone that this method is infinitely superior to any other specification.

Specification: Built throughout from ⅞in. selected tongued and grooved and V jointed matchboards in sections as described, to bolt together. Strong double doors, full width of end-hung on extra strong hinges and provided with lock and key and Tower bolts for holding door in position, also handle to door. Range of fixed framed windows in either side, complete with glass, extra strong roof covered with best felt and battened down. Wide barge boards on each end of roof. Sloping platform in front of door to allow of easy access of Cycle or Motor.

Sizes: No. 1, 6ft. long, 5ft. wide, 6½ft. high, **172/6**, floor **35/-**; No. 2, 8ft. long, 6ft. wide, 7ft. high, **245/-**, floor **56/-**; No. 3, 10ft. long, 8ft. wide, 9ft. high **405/-**, floor **100/-**; No. 4, 15ft. long, 10ft. wide, 9½ft. high, **660/-**, floor **210/-**; No. 5, 20ft. long, 12ft. wide, 11ft. high, **890/-**, floor **300/-**. All carriage paid to nearest Station. Prompt despatch guaranteed. Inch boards 20 per cent. extra. See booklet for further particulars.

Don't place your name on a hopeless waiting list for

THIS SEASON'S MOTOR CYCLES.

Make some selections from our extensive range, and we will candidly tell you the prospects. Let the following encourage you.

"I wish to thank you for your promptitude. You have been mostbusiness like throughout, and your courteous letters are refreshing in these days of commercial s.....ss!
Signed (W.H.P.)
Edinburgh, 1st July, 1919.

IN STOCK: ALLDAYS ALLON, CALTHORPE, IVY, METRO-TYLER.

Quickest deliveries of

BRADBURY, CALTHORPE, CLYNO, CONNAUGHT, HUMBER, IVY, JAMES, L.M.C., NEW IMPERIAL, P. & M., METRO-TYLER, NUT, SCOTT, SUN-VITESSE, WOOLER, ZENITH.

SECOND-HAND MACHINES, solo and combination, e.g.,

James, Triumph, Rex, Hobart-Jap

SIDECARS: GRINDLAY, RALLY, AND "THREE SPIRES."

STOCKISTS of DUNLOP, PALMER, and CLINCHER TYRES.

SIDECAR ATTACHMENTS.

CANOELET Sidecar, roomy coachbuilt body, finished red and black, heavy Dunlop tyre, disc wheel, apron, mat, fittings for any machine, whole as new; £28; Lucas King of Road head light, Cameo wind screen, luggage carrier, extra, if required; seen any time.—S., 26, Lime Hill Rd., Tunbridge Wells. [9241

SIDECARS. Sidecars. Sidecars.—Here you are Immediate delivery from stock of brand new sidecars, £26/10 each, real push cots; second-hand sidecars, with brand new bodies, £16/10 each; bodies, £7/10; chassis, new and second-hand, in stock —H. L. Stevens and Co., 184, Pentonville Rd., King's Cross, London. [9851

SIDE-CARRIERS AND PARCEL-CARS.

A.C. Box Carrier, wants fitting up; £25.—Johnson, 172, Avenue Rd., Acton. [9944

BABY Peugeot, single-cyl., mag., small van body, perfect order; £35.—B., 367, New North Rd., N. [9394

FORD, semi van body, £30 just spent on overhaul, receipt shown; £140.—55, Bonnerhill Rd., Kingston, Surrey. [9606

8h.p. De Dion Van, T.B., mag., wire wheels, 3-speed, reverse, engine just been rebushed; bargain, £40. —152, Camberwell Grove, Camberwell. [9217

TRADESMAN'S Carrier for sale, an excellent side car chassis with carrier box mounted, specially constructed for bakers' and confectioners' use, but suitable for other goods; price £15.—The Eastern Garage Co., 418, Romford Rd., Forest Gate, E.7. [8853

RUNABOUTS AND CYCLE CARS.

MORGAN Sporting, 1916; £145; ready to drive away.—Cordon, Cleobury, Mortimer, Salop. [X8677

A.C. Sociable, hood, screen, engine overhauled, smart; £75, exchange.—24, Beauval Rd., East Dulwich. [9375

SPORTING Cycle Car, 9h.p., late De Dion engine; £100.—26, Bramhleberry Rd., Plumstead, S.E.18. [9380

GENUINE 1914 Morgan, beautiful condition, lamps, complete; first 130 gns. secures.—Belletti, Deputy Mayor, Falmouth. [9820

MORGAN, 1915, M.A.G. engine, perfect condition, with hood, wind screen, lamps, etc.; £160.—Grose, 255, Holloway Rd., N. [9548

LANCASHIRE (except Fylde) and Cheshire Only.—A.V. monocar; enquiries invited.—J. Blake and Co., Official Dealers, Liverpool-Manchester. [7037

KENDAL 2-seater Cycle Car, 4 wheels, smart, 8h.p. 2-cyl. J.A.P., Stepney, hood, screen, perfect; seen any time; £105.—18, Malvern Rd., Dalston, E.8. [9224

MERRAL-BROWN.—For assured early delivery of the best three-wheeler.—Sole agents: Parker's, Bradshawgate, Bolton; Deansgate, Manchester. X9043

CARDEN Monocar, 1919, just delivered from makers, as new, fully insured, not been 100 miles; £125; any trial.—Mackaskie, The Folly, Laleham, Middlesex. [X8656

MORGAN de Luxe, 1914, a.c. J.A.P., electric lamps, repainted, perfect condition; £150.—Write or call after 6, Morrison, Sutherland House, London St., Paddington. [9192

A.C. Sociable, fully equipped, hood, screen, acetylene lighting set, 700×80 tyres (unpunctured), splendid running order; £100.—Toyer, 76, Cromwell Rd., Luton. [9537

1919 Carden Monocar, disc wheels; delivery expected every day; best offer over £130; owner got delivery bigger car.—Loyd, Cranbourne Lodge, Winkfield, Windsor. [9485

CYCLE Car Chassis, chain drive, 4 wheels, tyres tubes, 3 speeds, reverse, chains, radiator, etc. wants engine and body; £27.—Stoneleigh Hard Lane St. Helens. [9236

6h.p. Premier Motorette, a.c. type, water-cooled engine, hood, screen, electric light, new tyres perfect, fast and reliable; £85.—Ashburnham, Litchfield Rd., Sutton, Surrey. [9375

MORGAN, December, 1916, foot accelerator, hood screen, side curtains, electric and acetylene lighting, clock, speedometer, Klaxon, tools, jack, spare tube, coach painted recently; £200.—Davies, 73, Parish Lane, Penge. [9200

CARDEN Monocar, 1919, recently delivered not practically new, Miller head lamps and many extras; any trial; must sell immediately; nearest cheque to £129 secures.—Hunt, The Wellings, Claverley, near Wolverhampton. [X866

MORGAN, 1917, M.A.G. (a.c.) 8-10h.p., disc wheels hood, complete with lamps and all accessories spare chain and tyre, splendid condition throughout, and mechanically perfect; £180.—Ireland, 19, Bowness Rd Barrow-in-Furness. [X868

G.P. Morgan, overhead valved, water-cooled 10h.p. J.A.P., rebushed and perfect, hood, screen lamps, good tyres, new chains, dogs, and sprocket streamline tail, extremely fast racing model, good appearance; £175, or offer.—Culeridge, Matlock House Torquay. [976

Oil from Unsealed Cans.

GOOD lubricating oil is almost as essential to the well-being of a motor cycle engine as good workmanship and good material. If every motor cyclist fully realised this, we should hear less of engines being damaged by the use of inferior and unsuitable oil. At the present time the price of the best oils is high, and there is, therefore, more than the usual temptation to the unscrupulous dealer to palm off an inferior and cheaper grade upon the unwary. This is false economy, both from the point of view of the dealer, who should be zealous to retain the custom of his clients—even the occasional ones—and from the point of view of the rider whose repair bill will probably amount to shillings for every penny saved.

While upon the subject of lubrication, it may be desirable to mention another aspect, *i.e.*, the wisdom of following the maker's advice in the matter of engine oil. He has probably experimented with all the best oils on the market, and should, therefore, know what oil and what particular brand of that oil suits his engine best. The kind of oil employed has a greater importance than many imagine. We can recall a case where a change of oil from one type to another, namely, the substitution of a compound for a mineral oil, caused a very great improvement in the running of an engine. Both these oils were first-rate examples of their own classes, but one suited the engine, a little twin, much better than the other. If, then, a very real improvement can result in the substitution of one good oil for another, it will be readily understood that an inferior brand can be very harmful to the best of engines, and there is every danger of seriously damaging one's engine by the incautious purchase of even a single tankful of unnamed lubricant.

Our advice is: Decide on a first-class oil, preferably that recommended by the maker of the engine, who has no axe to grind in this matter, and, when purchasing it, insist on receiving it in a sealed tin or drum.

Benzole.

THE test of benzole shortly to be carried out by the Automobile Association should be of the utmost value to motorists, but, inasmuch as the test is to be made in a water-cooled car engine, we should very much like to see a second test in the air-cooled engine of a motor cycle. This test should be one of considerable duration extending into the winter, and the report should take note of ease of starting at various temperatures and liability to freeze in the tank or carburetter, as well as the more obvious points. Perhaps the Auto Cycle Union will undertake such a test, and also make an exact comparison of the m.p.g. obtained in the same engine and under the same conditions from petrol, benzole, and a mixture of the two in varying proportions.

It is known that benzole will give better consumption figures than petrol, but some misapprehension exists as to the extent of this improvement. In a trial recently carried out in Ireland one rider found that benzole gave him an improved mileage of 50% as compared with petrol. This is, of course, absurd, and only shows that his carburetter must have been very badly adjusted when petrol was employed, and that proper adjustment would have increased his m.p.g. very largely without any change of fuel. Similarly, when we hear of any extraordinary improvement resulting from the fitting of an extra air valve (or economiser, as it is sometimes called), we know that the fuel must previously have been used in a very wasteful manner, and that a considerable improvement might have been effected from a simple adjustment alone. A gallon of fuel contains a certain number of heat units, and no device on earth can obtain more from it.

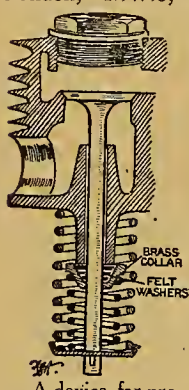
Benzole requires more air than petrol to give the best explosion. It is, however, better to decrease the size of the jet than to increase the air supply if the best all-round results in economy and satisfactory running are to be obtained.

An Index to the advertisements in this issue will be found on the page facing the back cover.

THE S.U. AIR-LEAK PREVENTER.

As we often tell our readers in the "Answers to Correspondents," the most frequent cause of difficult starting is due to air leaks at the carburetter or induction pipe unions. There is yet another source from which air can enter the combustion chamber and so far attenuate the mixture as to render starting difficult and slow running impossible, and that is through a worn inlet valve guide.

The S.U. Co., Ltd., Shipton Works, Prince of Wales Road, Kentish Town, London, N.W.5, have brought out a simple device which goes far towards improving the running of second-hand machines which have had a certain amount of wear. It consists of a small tapered brass collar containing a number of compressed felt washers specially treated, which abut against the end of the valve guide and through which the valve stem passes. The whole is kept in place by means of a light spring inside the main inlet valve spring. If a drop of oil is placed on the washers this renders the valve stem self-lubricating, as the oil-soaked washers retain their lubricating properties for some considerable time.

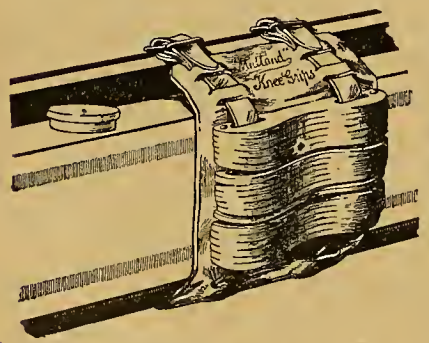


A device for preventing air leak through the inlet valve guide.

The device is, of course, only useful for preventing air leaks *via* the inlet valve guide; but in the case of an engine in which both valve guides are worn it is beneficial in stopping rattle in the case of a worn exhaust valve guide.

LEATHER KNEE GRIPS.

A NEW type of knee grip has been introduced recently by the Midland Gear Case Co., of Birmingham, and is illustrated below. As will be seen, the grips consist of flat strips of leather, shaped to receive the knee, through which two straps are threaded on to leather bases which bear upon the tank. The grips are very neat and smart looking.



A new type of knee grip marketed by the Midland Gear Case Co., Birmingham.

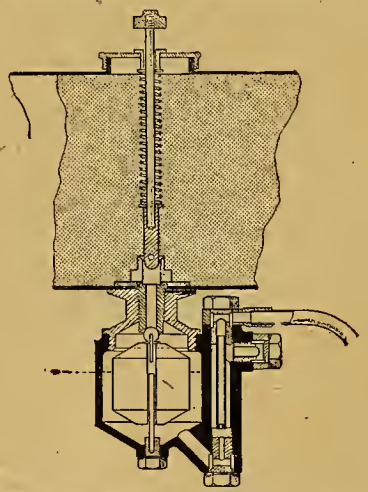
THROTTLE-CONTROLLED OIL SUPPLY.

IN our issue for March 13th, we described the Nash throttle-controlled lubricating device, in which the suction at the intake of the carburetter was made to supply oil to the engine in proportion to the opening of the throttle. Since the date mentioned, the Nash lubricator has undergone considerable experiment, and, in consequence, has been altered somewhat to render its manufacture more simple.

The original lubricator had an adjustable oil jet and a glass sight-feed was fitted. These are not embodied in the latest type. The former, it has been found, lends itself to undesirable alterations on the part of the novice, and the second is not necessary.

In place of the adjustable orifice, jets of various sizes, as in the case of the majority of carburetters, are supplied, and, when it has been decided which is the most desirable size, the range of supply over the varying throttle openings remains unaltered.

The new device is illustrated in section, and from the drawing it will be seen that the lubricator consists of a float actuating a ball valve, which keeps the oil at a constant level in the jet extension tube from which the suction at the intake pipe draws the oil to a level at which it overflows to the delivery pipe.



The Nash lubricator in its improved form.

Recently, we were afforded a demonstration of this device fitted to a single-cylinder James. A glass tube was fitted as part of the delivery piping, which was convenient to watch from the sidecar seat. At the smallest throttle openings the flow of oil was constant, and immediately more gas was given to the engine, the flow of oil was accelerated, and it was plain that at all times the supply of oil was proportionate to the load.

The device is the invention of Mr. Robert J. Nash, Herald Chambers, Martineau Street, Birmingham, and we understand from him that several manufacturers are interested in it, and are experimenting with a view to including it in the specification of their 1920 machines.

SPARE TUBE CARRIER.

MANY tourists wrap a reserve inne tube round their handle-bars, and to ensure the safety of a spar carried in this way, the Midland Gea Case Co. supply a suitable protector.

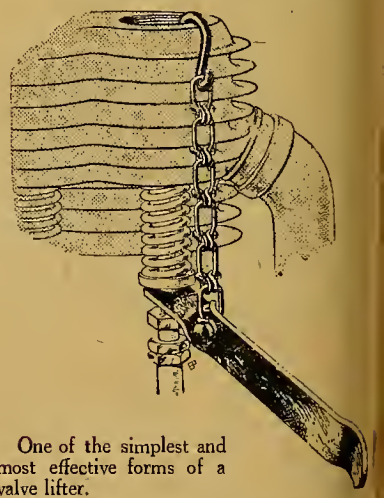
A handy spare tube carrier.

The case is approximately round, havin a small hole to take the valve. It i fitted over the tube, previously coile round the bar, and then locked in positio

A HANDY VALVE LIFTER

TO change a valve without adequat tools is an undertaking fraught wit many difficulties, and many moto cyclists do not appreciate this sufficientl to induce them to buy a valve lifte until experience has taught them th full value of such an accessory.

A small and very handy tool, suitabl for carrying in the toolbag, is markete by D. H. Jenks, 352, Shaftmoor Lane Hall Green, Birmingham, and has th advantage that it will suit any type engine. It consists of a lever, a hoo and a chain, by means of which the to is made adjustable to suit differe lengths of cylinders. The hook part the tool holds down the valve when th lever is operated, while the chain follo the radius of the cylinder fins shou these be extra wide.



One of the simplest and most effective forms of a valve lifter.

Occasional Comments by "Ixion"

Three Types of Steering.

DURING a certain week in July I rode four separate machines. One of them—a 1919-1920 model—steered beautifully at all speeds from five to sixty miles an hour. A 1914 machine handled perfectly at low and moderate speeds, but took a lot of holding when fully accelerated. Another mount, which was a resurrected 1914 type bearing current date, was prone to jump about until legal limit was left far behind, but was as steady as a rock at racing speeds. A fourth machine, which shall be nameless, behaved indifferently over the whole of its speed gamut. As I reflected on these contrasts, I began to wonder whether the unsatisfactory patches in the steering of the second and third machines were deliberately located by the designers concerned, since No. 2 was a stolid type of 'bus selling chiefly to frankly utilitarian owners, and No. 3 was something of a speed-iron by reputation. Anyhow, No. 1 convinced me that it is possible to design frame and fork so that steering shall be good at any speed. I commend the contrast to the attention of designers.

Riding Position.

SIMILAR contrasts became evident in the other aspects of riding comfort, and I spent some hours experimenting with various adjustments in order to discover whether the riding position could be suited to men of varying arm and leg reaches. Two of the machines had T.T. bars of the semi-dropped type. One of these happened to fit me like a glove at the first essay. I got the extra leverage afforded by the wide bar, and the extra weight on the front wheel by which the drop bar aids steering in a tight corner: yet the saddle was comfortable, and the wrists did not ache through carrying too much of my weight. The other T.T. machine was not pleasant, as delivered. There was far too much weight on the wrists, which ached after quite a short spin; moreover, any bump which joggled up my body was apt to upset the steering momentarily, since I could not make a lightning transfer of the weight from the bar to the saddle. I raised the bar a trifle, which improved matters muchly: but this made the footrests feel too far back, and set my boot sole at an awkward angle for the foot brake; neither of these parts could be adjusted, so that an ideal position was not obtainable. The touring machines intended to be sat with a straight back and fitted with raised bars brought well back at a comparatively narrow gap presented no real difficulties. Wangling the saddle about and raising or lowering the bar gave a good position for riders of very different reaches. If I were a maker, I should be inclined to muster selected members of my staff, ranging from 5ft. 6in. up to 6ft. 3in. in height, and see whether my standard range of adjustments provided them all with a good riding position. Modern handle-bars and saddle-pillars have little range of adjustment: footrests and pedals often have none.

A Rolls-Royce Motor Bicycle.

I SEE the motor cycling correspondent of *The Times*, as well as "Chinook" in *The Motor Cycle*, is laying stress on a notion to which I devoted much space some years ago: the demand for an ideally luxurious motor bicycle, irrespective of cost. That such a machine would sell freely does not admit of doubt, and his outline specification is excellent, including the maximum of comfort, cleanliness, and convenience. Nevertheless, it is surely far more desirable at present that the trade as a whole should regard the cheap, serviceable machine for the million as its ideal. The designer who evolves a supremely perfect machine to sell at, say, £200 will minister to the vanity and self-indulgence of a handful of plutocratic youngsters, and fill his own pockets. Neither result interests me appreciably. At the other end of the scale I see thousands of existing owners yearning for fractionally better machines at appreciably lower prices. Behind them is a waiting army of people who want to motor cycle, but cannot afford the outlay which the sport at present demands. If modern methods of production, modern elements of design, and the policy of generous output by both capital and labour are united in an attempt to furnish this bigger want, there is no reason why 1921 should not bring us far better machines at far lower prices. This event would have far-reaching effects alike on national prosperity and national health. Wherefore, I set it well in advance of the unquestionable opening for a super machine de luxe.

Question?

IT would be interesting to hear readers' opinions on another judgment of *The Times* correspondent. He states that 75% of us remain faithful to the two-wheeler, or desire to do so, when our incomes have risen far enough to lift us into the car-owning class. Oddly enough, one of our contributors submitted an article this week in which he took a precisely opposite view, holding that 75% of motor cyclists bade farewell to the two-wheeler without regret as soon as they became possessed of their first car. Personally, I am a living witness to *The Times* theory. I have owned and driven cars for years; but I am first, foremost, and by emphasis a motor cyclist. Even in winter, when roads are treacherous and the air is filled with spume or snow or carries a razor edge, I never take out a car for a solo jaunt. Most of my acquaintance, motor cycling or otherwise, esteem me crazy on the point. I offer no defence—*de gustibus non disputandum*. I have never analysed my invincible preference for the motor cycle. It may be that I am mean, and hate to burn four gallons of petrol when one gallon will do. It may be that I am a coward, and realise that the narrow two-wheeler can squeeze past when the broad four-wheeler will concertina itself upon the snout of the steam roller. It may be that I am a sportsman, and love the bellowing streak up steep hills which only a motor cycle can attain. Anyhow,

Occasional Comments.—

there it is: wherever choice is practicable, out comes the motor cycle for preference, though I grow elderly and a rowing heart does not love exposure to low temperatures for hours at a time. But for all my obstinacy I have always regarded myself as a freak, a *rara avis*, an eccentric, in this respect. And now I have it on the authority of the Thunderer itself that I am that dullest of all created things, an insignificant sheep-like follower of the great majority. Is it so?

Nut-locks Still Wanted.

MOTOR cyclists have always yearned for a good nut-lock. We felt the need less in the old days, for, after all, you can generally pinch a nut from the gear box to secure a horn which is jazzing along the handle-bar, and obtain a spare at the next garage along the road. But to-day we are charged 2½d. for a ¼in. Whitworth nut; and a careless speedster may easily shed a pound's worth of oddments along the road in one season at this price. In the early days, when the finish of a machine was so bad that we did not feel bound to treat it reverently, such crude expedients as bashing the tip of a bolt with a hammer, or painting the thread with some ropy sediment from an old paint pot, were good enough; nowadays one shrinks from unnecessary disfigurement of a machine which has cost a round £100 or more. Yet the roads are so bumpy that I have already shed quite a host of twiddly bits this season, and am gradually learning to safeguard the chief culprits. There are quite a number of expedients. I apply my own patent, wherever practicable. We all hate split pins, because they are usually tiresome when removal is necessary, particularly if they dwell under the tummy of a gear box. I found some nice, soft, bendable wire on the "Acme" labels of my fruit trees; much to the wrath of my land girl, I scrounged her spare hank from the potting shed, and found it a magnificent substitute for split pins: it locks the nut just as firmly, and you can always twitch it out in an instant, when required.

The Care of Laminated Springs.

NOW that spring frames are coming in, motor cyclists will begin to learn what car drivers have realised of late years—that laminated springs soon lose their efficiency if they are not regularly lubricated. The best car manufacturers are commencing to fit leather grease-retaining covers to their springs with an incredible increase in the prolongation of comfort. We can hardly expect that motor cycle makers will yet follow suit, for they work to tight cost limits; nor can accessory dealers come to the rescue until there are thousands of each type of spring frame on the road. The simplest method of lubricating the springs of a cycle frame is to squirt a little thickish oil round the tip of each leaf at the start of every run: but the effects will only last for a couple of hundred miles, and the machine becomes very unsightly, since the oil collects dust, and motor cycle springs are so prominently mounted. Home-made coverings are easily devised when both ends of a spring are anchored; but if one end of the spring is a sliding fit between rollers or the like, complete covering is impracticable, so that external oiling with its accompanying mess must be relied upon.

1,714 MILES IN 59 HOURS 47 MINUTES.

From Vancouver (Canada) across the U.S.A. to Tia Juana (Mexico).

JUST as the End-to-end record in Great Britain was at one time recognised as the Blue Riband of road records, American motor cyclists regard their endurance runs across the American continent as their classic event. This Transcontinental record is at present held by Alan T. Bedell, who in 1917 rode a four-cylinder Henderson the 3,296 miles in seven days sixteen hours sixteen minutes, which beat the record set up in 1914 by E. G. Baker by over three days.

This year Baker made a plucky attempt to recapture the record, but failed owing to the mud encountered. This Indian rider, however, has now secured the "Three Flag" record from Canada to Mexico, which in June this year was secured by H. C. Scherer on a Harley-Davidson flat twin. The following shows the progress of the record since 1915:

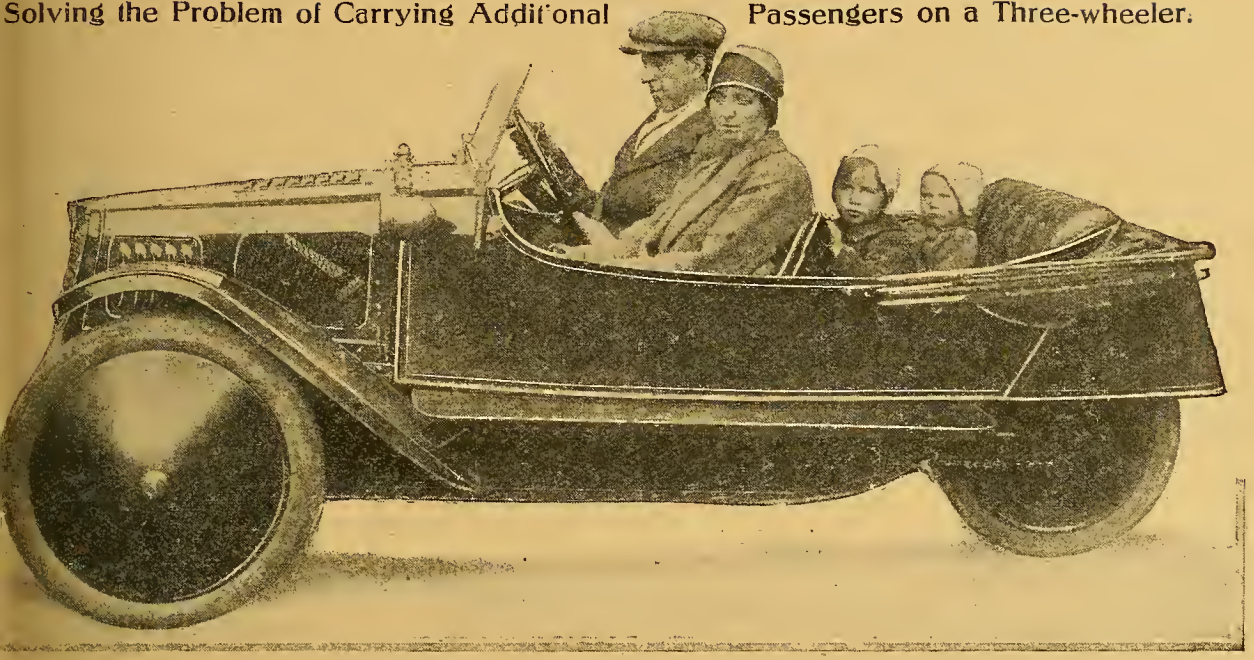
August 27th, 1915.—E. G. Baker (Indian)	...	81h. 15m.
July 20th, 1917.—Roy Artley (4-cyl. Henderson)	...	72h. 25m.
August 26th, 1918.—Wells Bennett (Excelsior)	...	70h. 0m.
June 21st, 1919.—H. C. Scherer (Harley-Davidson)		64h. 58m.
July 11th, 1919.—E. G. Baker (Indian)	... ...	59h. 47m.

"Cannonball" Baker, who, on an Indian, secured the "Three Flag" record from Canada to Mexico, a distance of 1,714 miles.

The first section of 137 miles between Blaine (Canada) and Seattle (U.S.A.) was covered by Baker in two hours fifty-five minutes — nearly T.T. average speed —and over the whole distance the speed works out at a fraction under 30 m.p.h. It was reported that the record breaker had engine trouble which delayed him for five and a half hours; this occurred, by a strange coincidence, at a town called Bakersfield.

A FOUR-SEATER MORGAN.

Solving the Problem of Carrying Additional Passengers on a Three-wheeler.



An 8 h.p. Morgan constructed with a special body to carry four passengers. The owner, Mr. E. B. Ware, who is head of the J.A.P. experimental department, is shown aboard with Mrs. Ware and family.

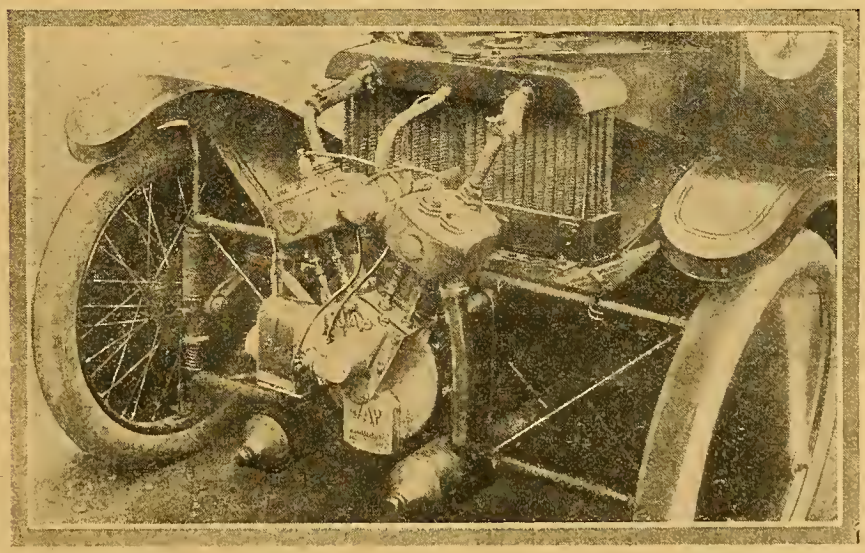
is a common sight to observe side-cars carrying three or four passengers. This year especially sidecar owners m to have schemed their utmost to ommodate all the family on their asure outings, and they have succeeded

Overhead view of the four-seater Morgan.

er than the majority of owners of abouts could hope to do. The owner the Special Morgan which is illus-ed on this page has, however, solved extra passenger accommodation problem in a most satisfactory manner. Ample room is provided for two adult passengers in the extra rear seat, the addition of which has not detracted from the appearance to any great degree. Messrs. Morgan do not list this type of body, but, as it has created a deal of interest wherever it has been seen, possibly such an additional model would be welcomed.

Mr. E. B. Ware, the owner of the Morgan—incidentally he is an old Morgan enthusiast—says that the additional two seats make less difference than might be imagined; neither is the steering affected by the additional weight on the rear wheel.

Mr. Ware is associated with the J.A.P. engine firm, which accounts for the particular type of J.A.P. engine employed. This is an experimental model, of which more may be heard anon. It will be noted that the oil sump has been enlarged, and a cleaner crank case obtained by die instead of sand casting. Another innovation is the jacket on the induction pipe connected with the water-cooling system, thus securing better vaporisation.

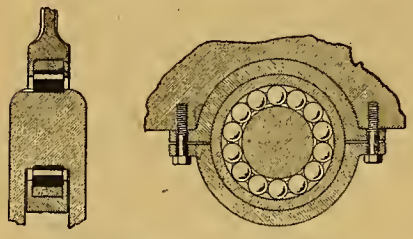


The new 8 h.p. J.A.P. water-cooled engine. An alteration immediately noticeable is the fitting of a large oil sump.

RECENT PATENTS.

REVIEWED BY B. H DAVIES.

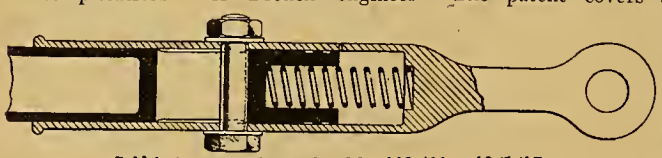
A RAY of humour sometimes illumines the path of a student of patents, as he wades through arid wastes of uninteresting specifications. Of recent years the desire of designers to apply roller bearings to the cranks of motor cycle engines has provided much comic relief. The chief problem, of course, is to accommodate the bearings neatly within narrow overall dimensions, and this difficulty is enhanced when two bearings have to be applied to the throws of a flat twin crankshaft. Makers have been scurrying to the Patent Office. The firstcomers probably hoped to obtain a master patent, but it says volumes for human ingenuity that there are now numerous patents on this point, all of them different and most of them excellent. Messrs. Brough and Poppe have devised the system shown herewith. The inner race is formed by a path turned on the crankshaft, and the outer race consists of a hardened steel ring, threaded into place. The rollers are inserted, one at a time, through a recess machined at one side of the cheek, and the split big end is then bolted into place. As shown, the inner periphery of the big end is flanged on each side. The drawings indicate how the same construction may be applied to the centre journal of a multi-cylinder crankshaft.



Brough and Poppe's roller bearing. No. 126,927. 15/2/19.

A Spring Connecting Rod.

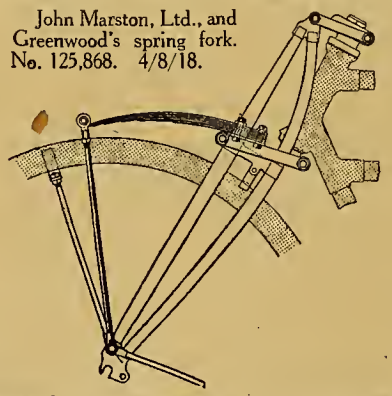
Strange as the notion may sound to the average motor cyclist, "elastic" connecting rods have attracted the brain waves of several inventors, though the weight, noisiness, and rapid wear have so far assisted to protect our engines from such a complication. A French engineer named Schultz has now, however, produced such a rod specifically designed for high speed engines. That part of the rod which carries the small end terminates in a sleeve which is a sliding fit over the stump of the part which carries the big end: a coiled spring is housed between the two parts of the rod, and a bolt, working in slots, limits the range of "elasticity." M. Schultz makes two principal claims on behalf of this rod. The first is that towards the end of the exhaust stroke the coiled spring overcomes the pressure of the burnt gases, the stroke is lengthened, and the cylinder is almost perfectly scavenged. Similarly, the connecting rod will, he considers, be fully extended at the commencement of the induction stroke, and the suction on the carburetter will be correspondingly enhanced. But the peculiarity of his invention rests in the air cushion between the two parts of the telescopic rod. During the explosion stroke the air is compressed, and prevents too violent a telescoping action. To avoid air leakages, a spiral groove is machined round the lower part of the rod, and an inlet port admits more air if required when the rod extends again. M. Schultz specially recommends his rod for use on rotary engines, as the lubricant flung outwards by centrifugal force will help to seal the air chamber.



Schultz's connecting rod. No. 118,411. 10/5/17.

Laminated Fork Spring.

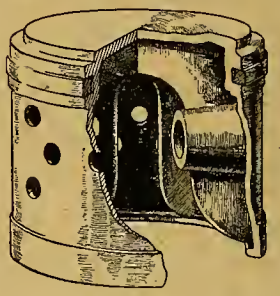
The new Sunbeam fork is sufficiently explained in the accompanying sketch. It embodies points of resemblance with several existing designs, but is original in two main respects. In the first place, it combines the not uncommon double side links with a leaf spring. Secondly, this leaf spring is horizontally arranged, and its thick end is anchored to a web uniting the two lower links of the fork. The patent covers an alternative construction, in which the thin end of the spring slides between rollers fixed to the mudguard. Excellent insulation should be furnished by this device.



John Marston, Ltd., and Greenwood's spring fork. No. 125,868. 4/8/18.

A Non-distorting Piston.

Messrs. Kickham and Frankham are keeping an earnest watch on our old bugbear, distortion, which is a more insidious enemy than many people yet understand, and is tackled in a host of forthcoming patents. Briefly, three essentials are concerned. In the first place, an even temperature of the cylinder head is not desirable, seeing that if the inlet pocket were as hot as the exhaust the charge would be unduly expanded before entry. Secondly, distortion of the cylinder barrel is fatal. Thirdly, distortion of the piston is undesirable. The sketch of the patentee's piston represents the most thoroughgoing attempt I have yet seen to conduct heat away from the crown (*i.e.*, the hottest part of the piston) to the fringe of the skirt (*i.e.*, the cooler part), and so to equalise temperature throughout the piston as far as possible. The crypt-like fins extend as deeply into the interior of the piston as is compatible with the necessary clearance for the connecting rod. It is claimed that the cooling is sufficiently improved for aluminium pistons to be given reduced clearance in the cylinder, and that the objectionable "slap" often experienced with cold pistons of this metal is thereby avoided.



Kickham and Frankham's piston. No. 125,728. 16/9/18.

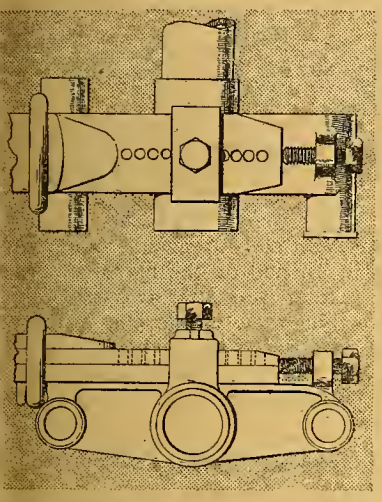
Simple Plug Construction.

Mr. Barrows is anxious to provide a cheap mica plug of good quality. Mica is extremely expensive, and in cheap plugs the quantity of mica is sometimes reduced by fitting a metal collar or spigot at about the centre of the insulator. This device is often clumsily employed in three respects—the collar is so wide and shallow that the central electrode is not necessarily true; the collar is machined from the solid, and costs too much; and, finally, it is so designed that the inside of the plug body is of several different diameters, and entails a number of manufacturing processes. Study of the sketch will indicate that Mr. Barrows has dodged all these pitfalls. Dark hatching indicates the mica portions.

Barrows's sparking plug. No. 125,803 29/5/18.

Belt Tension Device.

Lt. Haggard and Lt.-Cmdr. Walker ıve apparently designed a hush-hush ·cle car, as one or two of their notions that connection have recently been ıtented. Their present specification ›vers a particular method of tensioning

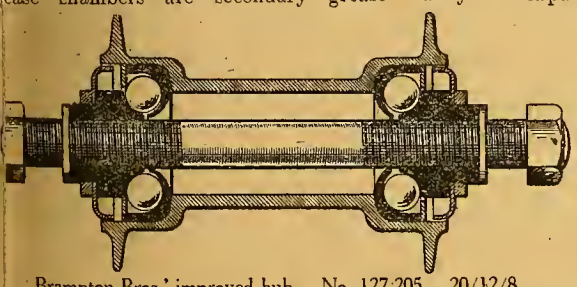


Haggard and Walker's method of tensioning belts No. 125,700. 23/3/18.

iving belts, and the sketch is practically lf-explanatory. The rear ends of a pair quarter-elliptic springs are secured as dicated to long narrow spring pads or ackets on the rear axle. When the lts require adjustment, the pinching rew, shown on the top of the sketch, slackened, the tension is corrected by eans of the horizontal screw shown on e right, and the pinching screw is then ;htened down again till its tip enters a cess in the top leaf. The two eyes at e lower extremities of the bracket form arings for the camshaft and pivot pin the brakes.

Dirt Excluding Hub.

The new Brampton hub embodies a uble safeguard against the entry of it and water into its ball bearings. udy of either end of the section will ow that an annular grease chamber is ovided between the inner cups and the ıshers outside them; these washers tate with the hub shell. Outside these ease chambers are secondary grease

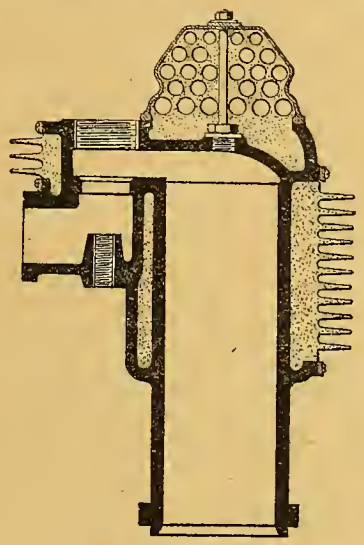


Brampton Bros.' improved hub. No. 127,205. 20/12/8.

aces, closed by inturned washers ured to the inner (or non-rotating) es. When all the grease chambers are l it is impossible for foreign matter to ter. Should the grease in the outer ambers be exhausted, centrifugal action will fling grit or water outwards, whilst the washers which close the ball chambers will stop the dirt from creeping inwards. This construction undoubtedly provides a good seal.

An Unusual Method of Cooling.

An Irish wit once said that there were four methods of cooling a petrol engine: air-cooling, water-cooling, oil-cooling, and not cooling it at all. M. Henri Debauge propounds a fifth method. Taking his stand on the fact that some 75% of the total heat loss is radiated from the cylinder head and 25% from the barrel, he provides separate jackets for each part. He fills these jackets with fusible alloys. For example, the barrel jacket may be filled with an alloy containing 45 parts of bismuth to 55 parts of tin, which melts at, say, 150° C., while the head jacket is packed with 9 parts of tin to 1 part of lead, melting at 220° C. The jackets



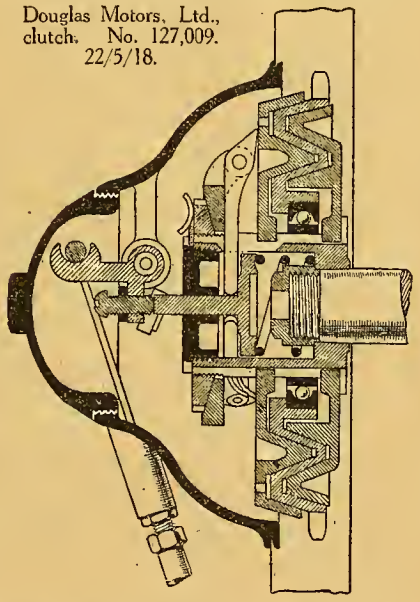
Debauge's method of cooling. No. 126,984. 30/5/16.

may be of varying construction: *e.g.*, the barrel jacket may be formed with hollow fins, and the head jacket may be freely penetrated by air tubes. To prevent bursting of either compartment when the alloy fuses, an expansion air tube, closed at the outer end, may be mounted in each half of the jacket: the alloy will expand into this tube, and the compressed air will drive the alloy back into the jacket as the alloy begins to cool. A fan may be employed to furnish increased draught. I should have thought that air-cooling would serve our turn in its improved modern editions. M. Debauge's system could not be cheap to manufacture.

Ingenious Clutch Design.

I think we may congratulate the Douglas firm and Mr. S. L. Bailey on the clutch shown in the accompanying drawing. In the past, many motor cycle clutches suffered from three main defects, viz.—(1) they were harsh in action, due to the difficulty of getting a reliable drive from small contact surfaces without using a ferocious spring; (2) handle-bar control was too stiff for nice finger action, because of the aforesaid spring; (3) slip developed rather rapidly, owing to insufficient contact area. The new Douglas clutch is full of promise in all three directions. Maximum contact area is attained within compact dimensions by excelling Dr. Hele-Shaw; his famous clutch has corrugated discs, and the Douglas has a kind of dazzle disc pinned between a pair of forked lightning plates. The need for a three ton spring is dodged by utilising leverage. The modest coiled spring in the interior of the gadget presses against a plunger, which operates the long arms of three levers which effect the pinching action on the clutch discs, a multiplication of about 9 to 1 being suggested, which converts a weak spring into great potency. The hand or foot control employs a two-to-one lever, which acts on the plunger; so we get a minor miracle in the form of a spring which is docile under control, but a Hercules in action. A suitable kick-starter is suggested for

Douglas Motors, Ltd., clutch. No. 127,009. 22/5/18.

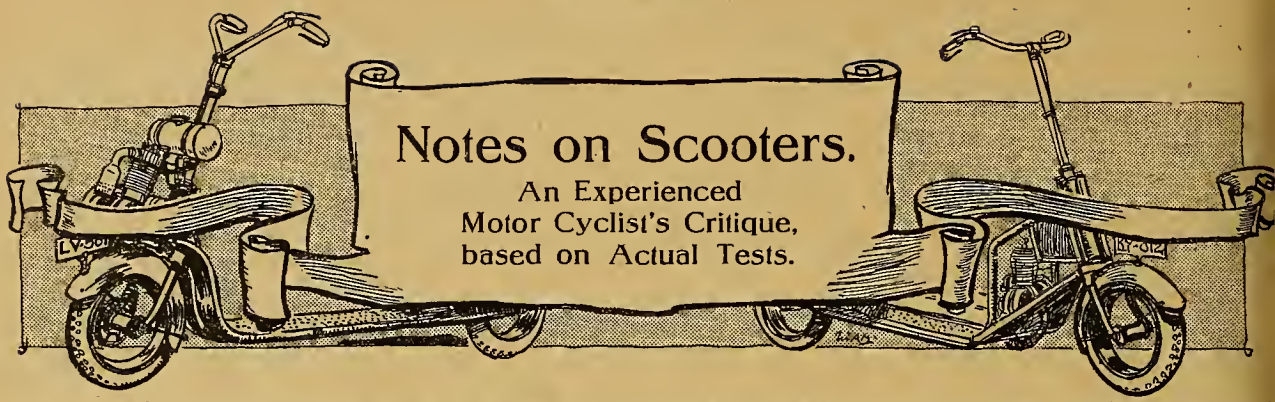


use when the clutch is mounted on the engine and not on the gear box; the former appears to be the intention.

[The date given is that of application and not date of acceptance, which in some cases is years after the former.—ED.]

MOTOR CYCLES FOR THE MILLION.

"The Motor Cycle Ford" is laughed at now, but "every ordinary cyclist is a potential motor cyclist," says the *Daily Mail* in a leader on the popularity of the motor cycle. "A fortune awaits the maker who considers this well and builds a motor cycle at once cheap and reliable." We have been saying this for the past ten years, but are nevertheless gratified to notice the ever growing interest of the lay press in the motor cycle.



Notes on Scooters.

An Experienced Motor Cyclist's Critique, based on Actual Tests.

DURING the last month or two I have been able to sample three scooters of different makes on the road, and the impressions gained in regard to their scope and practical value may interest those who have an eye to the establishment of these little machines in the future.

At the moment, the scooter is subjected to a great deal of criticism by various people. This invention is a toy, they say, and as such cannot last very long. On the other hand, a marked interest is being taken in this type of machine by many others; interest shown, as I can testify in my own case, by the extraordinary number of enquiries made while I had the scooter out and about on the road.

The hostile attitude first mentioned is probably due to the supposition that the scooter has been brought out as a cheap substitute for the ordinary lightweight motor cycle. Such a premise is somewhat of a mistake when one considers the low average speed and very small dimensions of the scooter.

As far as I can see the machine in question will, automatically, find a class for itself between the ordinary push-bicycle and the lightweight motor cycle. It has all the advantages of the former in regard to light weight and ease of handling, without the weight of the latter.

Shall we Stand?

The question whether a rider should stand up or sit down when using a scooter is undecided, but it is almost certain that if the rider adopts the seated attitude the scooter will be no longer somewhat of a freak, but will develop into the smallest and lightest type of motor cycle on the road. If things happen as in the latter case, then the term "scooter" will die a natural death.

My own experiences with these ultra-lightweights, particularly that type fitted with a saddle, incline me to the opinion that they will provide an almost ideal machine for three purposes: (*a*) As a utility vehicle for providing an inexpensive and extremely handy means for getting about in short excursions of necessity, as in shopping expeditions or visiting by inspectors, surveys of land and property by farmers, and in many other instances where short distance rounds and more or less compulsory visits have to be made from one spot to another. (*b*) Where people who do not feel physically fit to ride an ordinary push-bicycle or motor cycle, but wish at various odd moments of leisure to take short runs for pleasure purposes, either into the town or out into the country. (*c*) As a handy means for reaching golf courses or tennis grounds, when, at the same time, golf clubs, tennis racquets, and such like, can be easily carried on the machine. For these purposes the scooter provides a considerable advantage over the ordinary motor bicycle, owing to the facility and ease with which it can be handled in restricted spaces, while the minimum of labour and time is required in getting the machine on the road ready for use.

Advantages of the Seat.

During actual tests with various types of "scooters," several points became manifest in the behaviour of these machines on the road. In the first place, riding a "scooter" provided with a saddle is infinitely more enjoyable than undertaking a run, however short, on a machine of the "stand-up" pattern. The promoters of the latter type maintain that the standing up attitude on these miniature machines is an advantage where handling and manœuvring are concerned. My experience is the reverse, for, in the actual riding and handling of a scooter fitted with a saddle, I found that it was a good deal easier to control the machine when seated than when in the "stand-up" posture, whereas, in negotiating a "scooter" minus a saddle, I found that if, by mischance, you shifted your position an inch on the footboard, an uncomfortable wobble became manifest in the steering and behaviour of the machine, but when seated any tendency for one's body to be moved or jolted out of the normal riding position is resisted by one's own weight on the saddle.

I have no wish to be prejudiced on the question of riding position, as it may be possible for a person to become accustomed to the vertical attitude after practice, but it is almost certain that the rider will become tired after a journey of, say, ten miles owing to the road vibration and weight on the legs. The question of riding attitude brings one to the point that the greatest number of enquiries in regard to "scooters" and their possibilities came from the ladyfolk, who, in almost every case, voted for the saddle.

Possibility of Road Vibration.

It has been suggested that the rather diminutive wheels fitted to these machines would make the travelling rather more bumpy than in the case of the ordinary motor bicycle. But since one usually travels at only ten miles an hour, it is a very easy matter to avoid the larger inequalities in the road surface, and the travelling can be far more comfortable than would be generally expected. It is possible to travel along at twenty miles an hour, but unless one is in something of a hurry it is not wise to speed up a "scooter" to this

tes on Scooters.—

ıce, since it is after all only designed for compara-ely moderate speeds.

With regard to running costs, I found that it was ı easy matter to accomplish fifty miles on three pints petrol, or, in other words, a very good afternoon's ork in pottering about can be done at the cost of ıe shilling. The consumption of oil is practically gligible, as the diminutive motor only requires a ıall pumpful at occasional intervals. In comparing the "scooter" with the ordinary motor bicycle, this little machine is so light and small that it seems absurd to have to expend £1 in a licence; and, in the event of the "scooter" becoming at all popular in the future, it will not be just to tax it as a motor cycle. The charges for carriage of scooters in trains will also require to be overhauled, for it is manifest that some reduction from the charges usually made for motor cycles will have to be arranged in view of the small space occupied. H.R.M.

Comparative Tests of Petrol and Benzole.

Fuel Selection, viewed in the Light of Open Road Experiences.

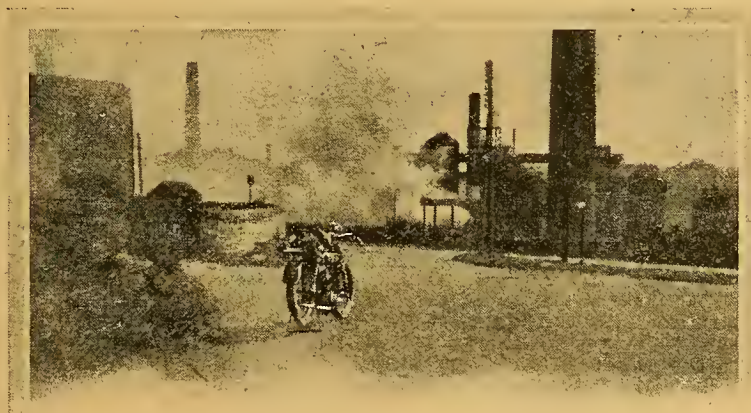
THE following notes are not intended as an exact enquiry into the theoretical values of two fuels, but merely to collate various practical experiences and comparisons; the tests have not even been liberately planned, the observations being thrust me, perforce, owing to the different supplies available in various parts of the country.

Of late a highly efficient T.T. single has been the iter's mount, and while ridden on short out and me runs, with benzole always available, it was never spected to possess a "knock" until disillusionment me one day on a long run into the Lake District. aving run out of benzole a fill of No. 1 petrol was tained, and, after ew miles running, remarkable differ-ce in the engine te was observed— e cleanliness and arpness of the ne being very ticeable, as it was so in a companion achine of similar pe.

The presence of ignition control so became appar-t, and the engine, hich had previous-been insensitive timing variations, w betrayed the most distress on the corners of "single-figure" hills. he carburetter used was a special instrument faked such a way as to be entirely automatic and no differ-e in its action was noticed.

Running on benzole the engine never showed signs tiring after a long day's running, but the use petrol almost invariably resulted in a hot engine d a tendency to knock at the end of a 150 les fast run.

Consumption worked out at about 20 m.p.g. increase favour of benzole, and, generally, the running is so ch more flexible and less trying to the rider that it almost painful to be compelled to use petrol—the fortunate part being that in the more out of way ces, such as Wales and the Lake country, where, an irony of fate the hills and corners abound, ben-e is very seldom obtainable.



The "spirit of progress." A benzole distillery near Wellington, one of the many which may hold the future key to the open roads of Britain.

If the use of home-produced fuel is to be encouraged, as it deserves to be on its merits, the distribution should be very much more general and efficient than it is at present, and steps should also be taken to encourage its popularity amongst country garage proprietors, who often betray most surprising ignorance of its properties, and utterly out-of-date views on the resultant ill-effects caused by its use.

An interesting practical demonstration of the increased mileages obtained from benzole as compared with petrol was recently arranged in the form of a competition amongst members of an Irish motor cycle club. A twenty-three mile course was chosen and the competitors had to make two circuits—the awards being to those running nearest a given speed, thus ensuring uniformity of driving conditions.

The first circuit was made on petrol and the second on benzole, the quantities used in each case being accurately measured. The results, tabulated below are rather surprising, especially in view of the fact that no alterations were made to the carburetters; moreover, all the competitors agreed on the easier driving and smooth running obtained with the native fuel.

Comparative tests of petrol and benzole in speed-judging contest of the Ballymena M.C.C.:

	Mileage per gal. Petrol.	Benzole.	Increase per cent.
Dr. Armstrong (Norton) ...	96.3	110.9	15.1
W. Cameron (Triumph) ...	91.5	124.0	35.5
J. Davis (Rex) ...	104.5	149.3	42.8
W. Dornan (Triumph) ...	124.0	149.3	20.4
D. King (James)	63.6	96.3	51.4
R. H. Wright (Triumph) ...	93.8	116.1	23.6

Average increase, using benzole, 30 per cent.

In no case did a competitor fail to have an increase of at least fifteen per cent.

WHARFEDALE.

A TELESCOPIC TWO-SEATER SIDECAR.

An Adaptable Body quickly converted from Single to Double-seater at will.

The Torpedo, similar in shape to the telescopic two-seater model.

The Sandum super two-seater sidecar.

WE recently had the opportunity of visiting the premises of an old-established firm of sidecar manufacturers, the Sandham Engineering Co., 336, Gray's Inn Road, London, who are introducing a large number of new models suitable for both the sporting lightweight and the family touring machine. The production of the latter, capable of carrying two adult persons, will undoubtedly satisfy the great existing demand for this type of sidecar.

The new Sandum de Luxe No. 1 sidecar is a single-seated model, although of medium weight, finely upholstered, and fitted with a heavily sprung backrest, which substitutes the old hinged pattern for a sliding one, is built as low as possible, and offers but little wind resistance—a model that will appeal to the speedy motor cyclist.

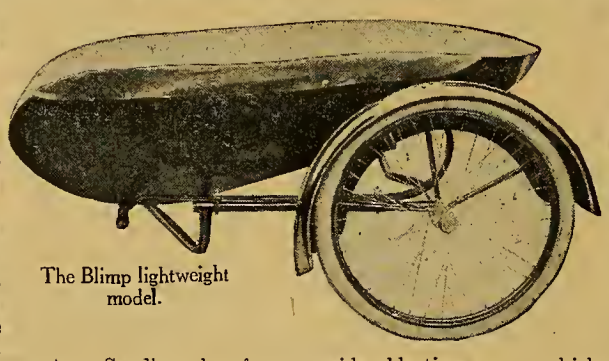
Ample space is provided for carrying wraps and spares in the locker located under the seat and in the space concealed by the backrest.

The new super-two-seater, although only a few inches longer than the single-seater, is capable of carrying two adults. The hinged front seat, when thrown forward, enables the rear passenger to enter through the rear door with ease. The front seat, however, is cut away at the forward door entrance, allowing of easy access to the front compartment, while the rear passenger's feet are accommodated beneath the front seat, and, consequently, the maximum amount of comfort is attained.

The chassis, provided with three heavy leaf springs, has been specially designed for this model, and has a substantial four-point attachment.

Another smartly finished body is the Sandum Bulbous Back, Model A, the notable feature of which is the symmetrical design of the upholstery. A test of the comfort of the backrest proved the makers' claim to be correct.

A super-lightweight, suitable for a low-powered motor cycle, upon which Mr. Sandham has for a considerable time concentrated his attention, may also be seen at the factory.



The Blimp lightweight model.

The existing model, the Sandum flyweight, constructed of three-ply wood and lightly upholstered, is fitted with a special underslung chassis, consequently having a low riding position. Lock accommodation is provided behind t adjustable backrest. The two mod at present under construction are t Blimp lightweight, so-called because its similarity to the small Blimp airshi used during the war as submari chasers, and the fully patented te scopic projectile type sidecar.

The former, which, owing to its son what unconventional design, offers mi mum resistance to the wind, and wh upholstered weighs under 20 lb. T model will, when fitted with a specia designed chassis, be placed the market within a short tin The telescopic model, construct of oxy-acetylene welded steel n and rear, will be capable of car ing two adults when expand and when contracted will form small single-seater, suitable both racing and touring purpos The front portion slides with the rear cylindrical portion, b being carried on supporting ra to which are attached locki bolts which pass through lon tudinal slots cut in the two hal of the sidecar.

These bolts are fitted, on inside of the body, with wing nu which, when slackened, enable the fr half to be pulled out, and, when tighten to hold the two halves to the chassis.

A false seat and backrest are loca beneath the seat proper and rear ba rest respectively, and can be adjusted the forward position when required.

READERS' ROAD REPORTS.

TO readers who propose touring Wales, the Midlands, or Scotland, the following reports from riders who have covered the districts will prove useful:

Shrewsbury, Oswestry, and Llangollen.—Excellent except for a few stretches near Llangollen.

Llangollen, Bala, and Dolgelly.—Very fair, dusty near Corwen and Dolgelly.

Dolgelly, Machynlleth, and Aberystwyth.—Poor; three miles each side of Machynlleth dangerous on account of timber-hauling.

Aberystwyth to Rhayader.—Fair, very loose surface.

Rhayader to Builth.—Excellent.

Builth to Talgarth.—Fair, many pot-holes.

Monmouth, Ross, and Leominster.—Good generally, but careful driving is necessary on account of deep pot-holes.

Raglan to Monmouth.—Perfect surface throughout.

Talgarth, Abergavenny, and Monmouth.—Good generally, but some very bad stretches, notably one just west of Abergavenny.

Leominster, Worcester, Stratford-on-Avon, and Warwick.—Fair, with two or three excellent stretches. Near Stratford and Warwick, very bad.

Warwick to Banbury.—Mostly in fair condition.

Banbury to Oxford.—Three miles each end bad, middle section excellent.

Oxford to Reading *via* Pangbourne.—Very good.

Birmingham to the East Coast.—The route *via* Coventry, Market Harborough, Kettering, Thrapstone, Cambridge, Newmarket, Bury St. Edmund's, Ixworth, Scole, and Beccles is throughout fairly good; in comparison with some m roads, it might be described as excelle The bad patches are in and arou Coventry, between Desborough and Ro well and Kettering ('bus routes), G manchester and Fenstanton, and parts the road between Cambridge and N market.

Care should be exercised in follow the route above mentioned at such poi as Kettering (signposts very confusi between Botesdale and Harleston on Beccles road, and between Harleston Beccles to avoid Bungay.

Through passengers for the East C should avoid the narrow streets of C bridge by turning left on entering town and following the Victoria R and Victoria Avenue to Maids Causew which is a continuation of the N market Road.

THROUGH FEMININE GOGGLES.

A 4 h.p. Douglas outfit at the main entrance to Woburn Abbey, near Hockliffe.

IT is often a difficult matter for the experienced rider to decide which type of machine to buy for the season's riding: lightweight or heavyweight, solo or sidecar combination. To the beginner this is an even greater problem. Gears and clutches are a name only in the early history of the motor cyclist, but later they grow in importance to such an extent that a machine without them is an unentertainable proposition except to the most sportively inclined. The lightweight solo mount is designed for so entirely different a purpose from the sidecar outfit that, where a lot of riding has to be done, both types are necessary if one's pocket can run to the initial outlay. The 2½ h.p. to 3 h.p. is ample for light solo work, and will average a greater speed than one can safely manage under all road conditions; but when a passenger or a great quantity of luggage has to be taken, it is far better to buy a sidecar outfit than to make any serious attempt at pillion carrying.

The tendency of manufacturers of late has been to increase the horse-power of the engine for sidecar work. The 3½ h.p. Triumph and the Douglas sidecar machine have both merged into "fours." The sidecar is a big drag, and doubtless the makers realise that to have the little extra power is very much more pleasant than to be continually feeling that one's outfit is under-powered and must be well driven to be equal to every emergency.

The 4 h.p. Douglas in Civilian Hands.

I have recently had an opportunity of putting a 1919 Douglas combination under a number of fairly stringent tests. Most folk are familiar with the smart appearance of these turnouts. This, together with the lightness and simplicity of control, will make a special appeal to the feminine element.

It is always a simple matter to start the engine, and the turn of speed would satisfy anyone with a weakness for "blinding," but the point which appealed to me most strongly was the gentle ticking over that allowed a positive crawl when required, while the climbing power of the engine is past reproach. Of course, we expect all this in a 1919 model, and in the Douglas we are far from disappointed. If I might make one suggestion, when fitting a new belt, or buying a spare, one of an inch width would give better

WHAT SHALL WE RIDE?

A Motor Cyclist's Views on Various Practical Topics.

results than the ⅞in. fitted by the manufacturers, and I observe that the pulley will take the extra size. Speaking of sidecars, the Douglas, for a medium size, has a wonderful amount of storage room. The bulbous back is one huge receptacle, and sidecar designers probably are aware by this time that a neat method of hiding away packages has a special appeal to the feminine passenger. On a long run it is tiring to have one's position cramped by luggage hampering the feet.

Overloading.

If cruelty to engines were punishable, as is cruelty to animals, I am afraid a fair proportion of riders would have the R.S.P.C.E. on their tracks. Whether it is due to the fact that "would-be" motor cyclists cannot obtain delivery of machines, and are determined to ride regardless of where or how, I do not know, but never do I remember seeing so much abuse of sidecars as during the recent fine weather. A most flagrant case was the cargo of a Clyno combination. The turnout was obviously some six or seven years old, and, besides the driver and, presumably, his wife, three children were strapped on in various parts, together with three petrol cans tied under the sidecar, while sundry suitcases were roped to the back. When I first espied them, the driver was struggling with a puncture in the sidecar tyre, which was worn down to the canvas, and, as he eventually restarted opposite my garden gate, I could hear the engine labouring and knocking up an incline of about 1 in 20.

Crocks on the Road.

Perhaps there have never been so many rediscovered ancients on the road as at the present time, and in this case, as in many others, I felt much grief for the poor engine; but the driver went cheerfully on, and I wondered whether such as he possessed great pluck or merely unsurpassed ignorance. Personally, I dare not have gone out of sight of home with such a heavy load, yet who can say that the whole party were not thoroughly enjoying themselves? In the world everything is a matter of comparison, and no doubt it is fine fun taking one's chances with an ancient mount if one has not been previously spoilt by up-to-date models and refinements.

MAY WALKER.

A 2½ CWT. RUNABOUT.

A Light Two-speed Four-wheeler, incorporating Gibbons Components.

THE Gibbons "cycle car" is not altogether a new proposition, so far as our readers are concerned. In June and August, 1918, we gave particulars of the original model, which promised great scope for development. Further, the Gibbons Co. has been advertising in *The Motor Cycle* for some time working drawings of an improved model to enable amateur constructors to build runabouts for themselves. It has been decided now, however, to market the complete vehicle, in addition to sets of materials for building privately.

Chief among the points of interest in this little vehicle is its extremely low weight, which makes it a sidecar alternative rather than a competitor of the more conventional designs which form a step between sidecar and light car.

Sidecar Alternative

Once before we described the Gibbons vehicle as a passenger body with just enough mechanical element to propel it, instead of a more or less elaborate piece of mechanism fitted with accommodation for its passengers. There is a distinction between the two, and this will be appreciated by anyone examining the accompanying drawings, in conjunction with those of a motor cycle and sidecar or a three-wheeler.

In this machine, the usual frame is dispensed with, the body being built strong enough to support the weight of the propelling machinery. The body allows ample leg room and has a side door, while behind the seat is arranged a locker sufficiently large to accommodate two medium-sized suit cases. The tanks are arranged in front of the dashboard.

The body is supported on the axles by a pair of coil springs at the rear and a single spring at the front, the latter being carried on a form of universal joint at which the axle pivots. The steering is controlled by a wheel with a horizonal column and twin cables running over pulleys.

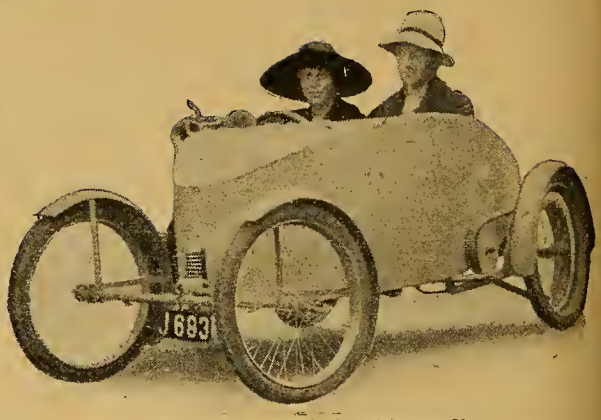
As will be seen from one of the illustrations, the mechanical elements have been reduced to a minimum, and consist (a) of an engine, which in the machine depicted is a 4 h.p. single-cylinder J.A.P., and (b) of a countershaft driven by chain from the engine and fitted with a simple form of gear, which gives a high gear drive on one wheel and a low gear on the other, the ratios being 5 to 1 and 11 to 1. Each gear is provided with an independent disc clutch operated by a hand-lever. The final drive is by belt.

The engine is supported on the ends of two transverse members, which extend right across the body, and the rear axle is provided with radius rods which carry substantial brake shoes working upon the belt rims.

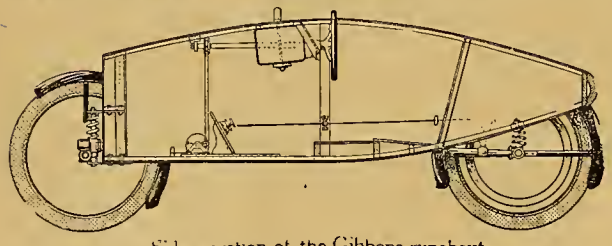
Moderate Price.

Ready for the road the machine, with 26in. × 2½in. tyres, weighs but 2½ cwt. and measures 8ft. 6in. by 4ft. 6in. overall.

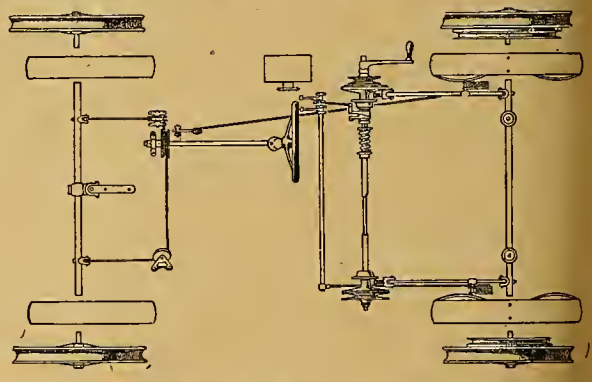
We understand that it is the intention of the Gibbons Co. (who are located at Station Road, Chadwell Heath, Essex) to market the complete vehicle at £98, while a set of fittings, including hood, Triplex screen, gas lamps, disc wheels, tools and horn, will be listed at £28, the total figure comparing most favourably with the prices of a sidecar outfit.



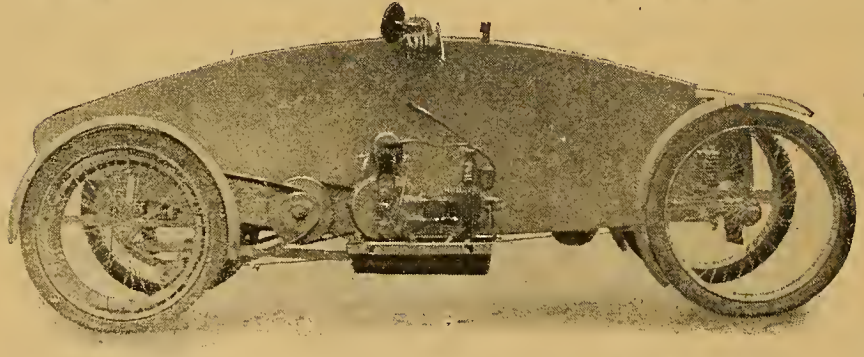
The Gibbons runabout which weighs but 2½ cwt



Side elevation of the Gibbons runabout.



The mechanical elements of the Gibbons vehicle



Side view, showing the single-cylinder engine and countershaft drive

GOVERNMENT SALES.

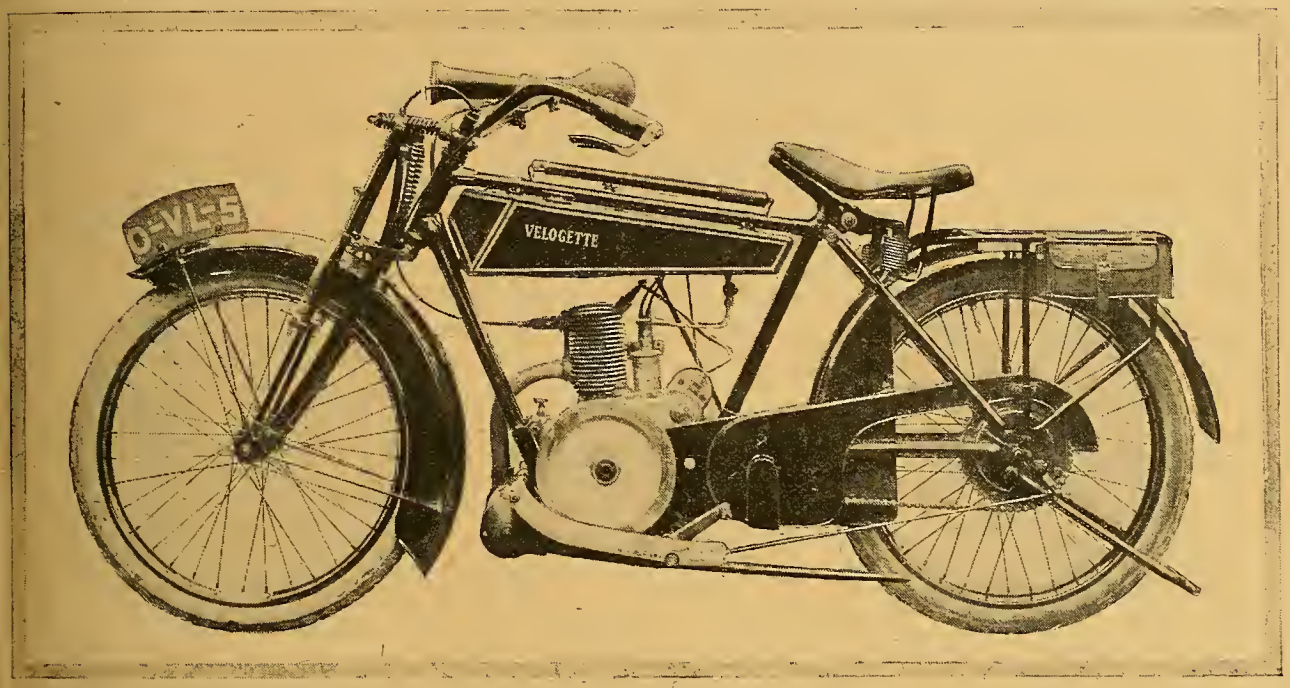
The August issue of *Surplus* announces that sales will be held in various provincial centres, but no dates are given. These must be obtained from the auctioneers, and will no doubt be well advertised locally in most cases.

Mechanical transport vehicles (motor cycles are not specifically mentioned, but are mostly included) will be sold at Manchester, Sheffield, Leeds, Halifax, Edinbugh, Glasgow, Dublin, Birmingham, Colchester, Newcastle-on-Tyne, Liverpool, Cardiff, Southampton, Coventry, Bristol, Spalding, Winchester, Portsmouth, Aldershot, and Middlesbrough.

Some of our readers may be glad to know that there are some excellent motor cycle accessories in one of the galleries at the Agricultural Hall, which are sold at fairly reasonable prices. These include mechanical horns, lamps, and tool kits for various well-known makes, and nearly all are in first-class condition. The articles are sold for cash at fixed prices, and those who find a difficulty in obtaining such items would do well to call.

THE 1920 VELOCETTE.

67 mm. Bore, 78 mm. Stroke, 275 c.c. Capacity. Mechanical Lubrication.



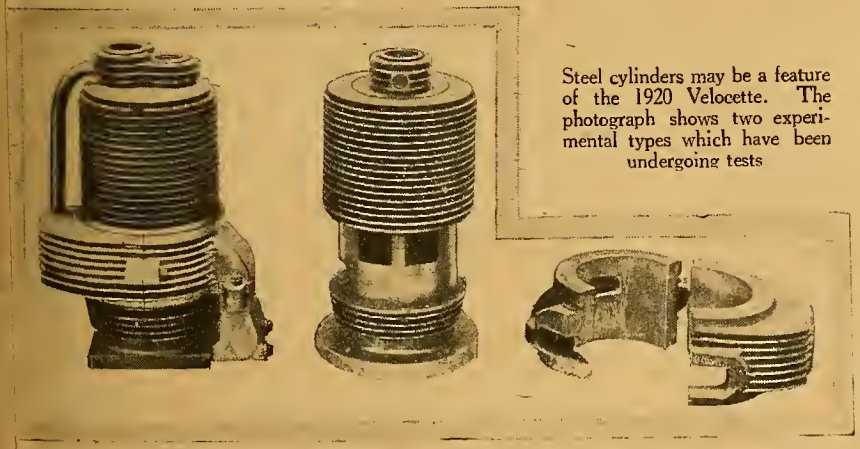
Transmission side of the Velocette two-stroke, which has been entirely redesigned for 1920.

PROBABLY of all two-strokes the Velocette is regarded as the most economical, and, while there are others with which over 100 m.p.g. are regularly obtained, we do not recall readers' reports of any one make with which extraordinarily low petrol consumption has been so consistent. Some months ago we ran one of these miniatures and regularly obtained 145 to 150 m.p.g. on short journeys, under which conditions one naturally expects higher consumption than on longer runs. This point alone—accounted for by its mechanical lubrication—places the Velocette in a class almost by itself, and particulars of the 1920 models—which embody some of the war experience of their designers—cannot fail to interest the followers of two-stroke evolution.

The three-port two-stroke is the most simple type of engine it is possible to make, and there has been a reluctance on the part of designers to depart from its extreme simplicity by introducing mechanism which naturally increases its cost. They have contended that its extreme simplicity is the keynote of its existence—that, by making it more complicated and more costly to produce, it becomes a direct competitor to the four-stroke without the four-stroke's advantages and economy. There are others, however, who maintain that the undoubted advantages of the two-stroke make it worth while to develop it even at the expense of added mechanism and increased cost, and that, though it embodies as many parts as the four-stroke, such additions are justified, provided all-round efficiency is equal or in excess of a four-stroke engine of the same size and costing the same to produce.

No one will disagree with this, as, if a twin-cylinder impulse effect can be obtained by a single-cylinder engine, and if such an engine is so designed that its consumption figure is as good as a four-stroke, then additional mechanism is justified; even if it does slightly exceed the four-stroke single on this point, yet it is less than a four-stroke twin.

In this latter school of engine designers is Mr. Percy Goodman, of the Velocette firm, and his faith in the two-stroke system is in no way governed by its simplicity. Although his latest design, which is illustrated, and will be tried out in the A.C.U. Six Days Trial, is extremely simple yet nothing has been sacrificed to gain this end.

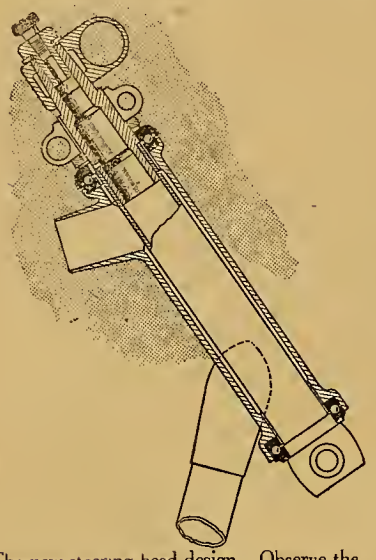


Steel cylinders may be a feature of the 1920 Velocette. The photograph shows two experimental types which have been undergoing tests

A Large Crank Case, Outwardly.

Probably the most interesting departure from usual practice is the crank case of the new Velocette. This appears to be extremely large as compared with the average two-stroke engine crank case; in fact, it somewhat resembles the case which would embody a gear unit. Of course, the oil sump is responsible for some of the bulk of this casting, the compartment containing the crank being extremely small. This takes the form of a circular recess with a long plain bearing on one side, the single-sided crankshaft being threaded through from the crank case. When this is done the "big end" of the connecting rod can be placed on the crank and held in position simply by a spring ring in a groove on the end

of the crank. Even this does not appear to be necessary, as Mr. Goodman's own machine has done several thousand miles without a retaining ring. The crank has



The new steering head design. Observe the lubricator at the top of the tube.

a balance wheel riveted to it on its outer side, so that the weight is more or less on the centre line of the cylinder.

Reducing the Compression Space.

In order to reduce the compression space as much as possible, a cone member is inserted in the annular chamber, and positioned by a spigot shown in one of the illustrations. An outer plate is then screwed in by means of a special key, which engages two of the series of holes around the plate. This locks the cone member securely in position.

The magneto drive is by means of gears, and both magneto driving pinion and main drive wheel are carried on the flywheel boss. Thus by removing the nut at this end of the shaft the crankshaft may be withdrawn. Three wheels are used in the magneto drive, the centre one being of bronze, and carrying on its shaft a slow worm engaging a worm wheel on the vertical shaft of the mechanical pump.

Variable Mechanical Pump.

At the lower end of the shaft is a plunger ¼in. in diameter working in a sleeve which acts as a valve. As the vertical shaft revolves it rotates this sleeve, and a port cut in its side registers alternately with the intake and outlet ports in an outer sleeve. A cross pin on the shaft works through the sleeve on an inclined plane on the stationary outer sleeve, thus causing it to reciprocate as well as rotate, the reciprocating motion being governed by the adjustment of the screw at the head of the shaft. Thus the stroke of the pump plunger is variable.

It will be observed from the illustration that the plunger of the pump has a truncated piston above it; this acts as a second pump, which is used to lubricate the vertical shaft and the worm gear.

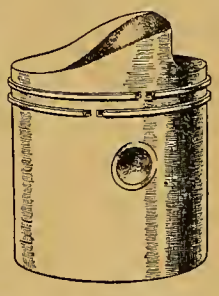
Drawing the oil through a strainer from the sump, the pump forces it through the main bearing into the big end. Centrifugal action then throws the oil on to the cylinder walls and small end. By slackening a nut at the base of the pump, the whole of the lubricating device may be withdrawn without emptying the oil in the sump.

This lubricating unit is an exceedingly nice piece of work, and has the virtue that when dismantled it cannot be reassembled except in the correct manner. The fact that no ball or spring-operated valves are used in its construction, and also that the pump is always immersed in oil, are points in its favour.

When the engine is running the head of the pump-shaft, which protrudes from the "crank case," can be seen rising and falling as well as rotating, and it is easily possible to ascertain the speed of the engine by timing this movement, since the pump-shaft speed is only 1 revolution to 75 of the flywheel.

Piston and Cylinder.

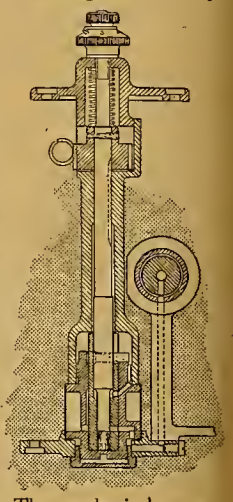
The piston of the new engine is of aluminium alloy, and inside the head are cast a number of radiating ribs. Two very thin rings are fitted. The cylinder on the model we examined was of cast iron, but many experiments have been and are being made with steel cylinders, the results of which give good promise for the future. In all probability steel cylinders will be fitted as standard on all 1920 models, but until this feature has been proved, and the results are to the entire satisfaction of the makers, nothing will be decided.



The aluminium piston. Note the extremely narrow rings.

We saw several steel cylinders, and learned many interesting details concerning the results obtained from them. One of the illustrations shows a cylinder which is the forerunner of the design which may make its *début* in the A.C.U. Six Days Trial.

This cylinder is turned from the steel bar, and has twenty-four very thin fins. The ports are machined in a finless portion of the cylinder, thus rendering it possible to obtain accurately proportioned and positioned ports. This part of the cylinder is encircled with an aluminium member which embodies the transfer passage and intake and exhaust ports, and has a number of deep radiating fins.

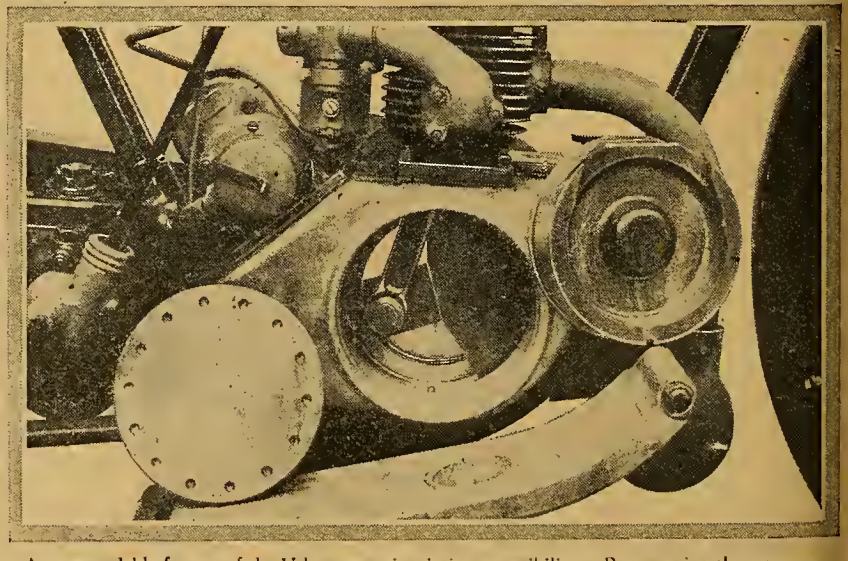


The mechanical pump, showing the oil channel to main bearing.

This jacket is made in two pieces fitted tightly against each other on one side and with a certain clearance, when cold, on the other to allow for expansion. At the top and bottom the jacket is fixed by the adjacent steel fins being spun over the aluminium member. In all probability the steel cylinder which will be used in the Six Days Trial will have fins increasing in diameter as they approach the head, while vertical fins may be used on the head itself.

The Compression Ratio.

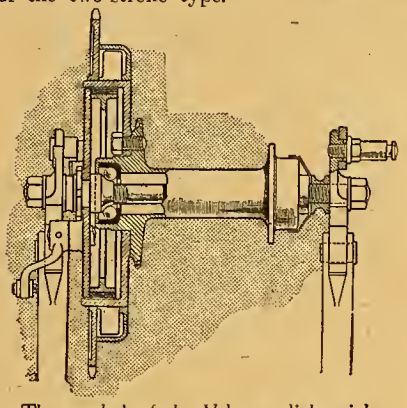
So far, we understand, experiments have proved that it is possible to carry the compression to a higher point with this type of cylinder than is usual. As an example of this, in the old Velocette



A commendable feature of the Velocette engine is its accessibility. By removing the retaining disc and withdrawing the compression plate the crank and big end are exposed, and, when necessary, the crankshaft withdrawn.

The 1920 Velocette.

engine, with a "capacity" of 220 c.c., the volume of the combustion space was 52 cc., and, after deducting the useless cylinder area (below the ports of a two-stroke cylinder), the actual capacity of the engine was 150 c.c. It will be seen this is a ratio of approximately 4 to 1. With a steel cylinder, an engine has been run with a combustion space as small as 6 to 1 ratio, but this, naturally, overheated, and may be taken as the other extreme. However, during these experiments, the cylinder head was red hot, and the moving piston could be seen through the glowing metal, but the aluminium fins at the base were sufficiently cool to allow one to rest the hand upon them. Mr. Goodman is now experimenting to find the compression ratio most suitable, and anticipates that he will obtain increased efficiency through being able to carry the compression to a point not hitherto attained in air-cooled engines of the two-stroke type.



The rear hub of the Velocette lightweight, showing the internal expanding brake.

The new machine is very neat in design. 24in. wheels are retained, but the section of the tyres is increased to 2¼in. The frame has a sloping top tube and duplex front tubes, but, on the whole, follows well-used practice. The details are good, especially the rear expanding brake, the spring-up stand, and the steering head. The last named is provided with a large lubricating orifice at the top of the steering tube.

As far as possible, black finish is used, and, with its gold-lined tank, the little Velocette looks very smart.

As hitherto, the Velocette for 1920 will be chain-driven and fitted with a countershaft gear box. These will be of both the two-speed and three-speed types, with kick-starter and clutch optional. Both gear boxes are exclusively of Velocette design.

The equipment includes C.A.V. magneto and Brampton forks.

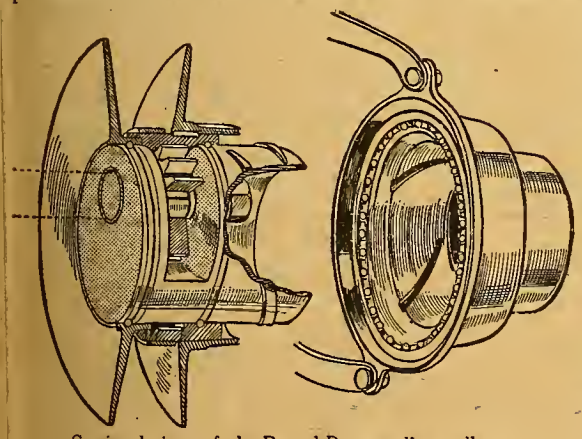
Another Expanding Pulley Gear.

Undergearing employed to obviate Small Pulley Diameter on Lower Ratios.

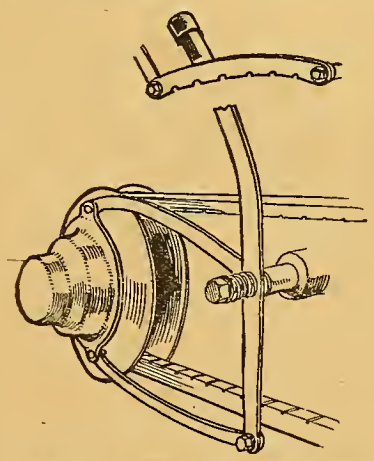
THERE are many motor cyclists who are owners of single-geared motor bicycles, and the fact of having only one gear sooner or later causes dissatisfaction, owing to the inconvenience involved. A description, therefore, of a simple form of expanding pulley gear which can be adapted to practically any model, no matter how old, is bound to interest a large proportion of our readers.

The gear under consideration is the production of the R. and P. Motor Accessories Co., 106, Shoe Lane, London, E.C.4. It is an adaptation of the undergeared pulley such as was fitted on certain models of the N.S.U. and Wanderer machines.

The pulley gear is mounted eccentrically on the engine-shaft, and in most cases a new shaft has to be fitted, so that sufficient length of shaft is obtained. On the shaft is mounted a small pinion which meshes with an internally-toothed ring inside the outer pulley flange. On part of the inner shell a quick pitch thread is cut, which engages with a similar thread cut upon the inner side of the outer shell, which, as will be seen from the illustration, is provided with a large ball bearing. Between the pulley flanges is a loose ring, on which the belt may run freely when the flanges are fully expanded. The outer shell is coupled by suitable links to the change speed lever, and so arranged that the expansion of the flanges corresponds to the swing of the pulley gear about the shaft, and the correct belt tension is maintained, no matter what gear happens to be in engagement. The device is simple, should work well, and there should be a ready demand for it among a considerable section of our readers. It was shown to us fitted to a 1906 model 3½ h.p. Triumph, and we were informed that the experimental control, which was somewhat crude, would be considerably refined.



Sectional views of the R. and P. expanding pulley.



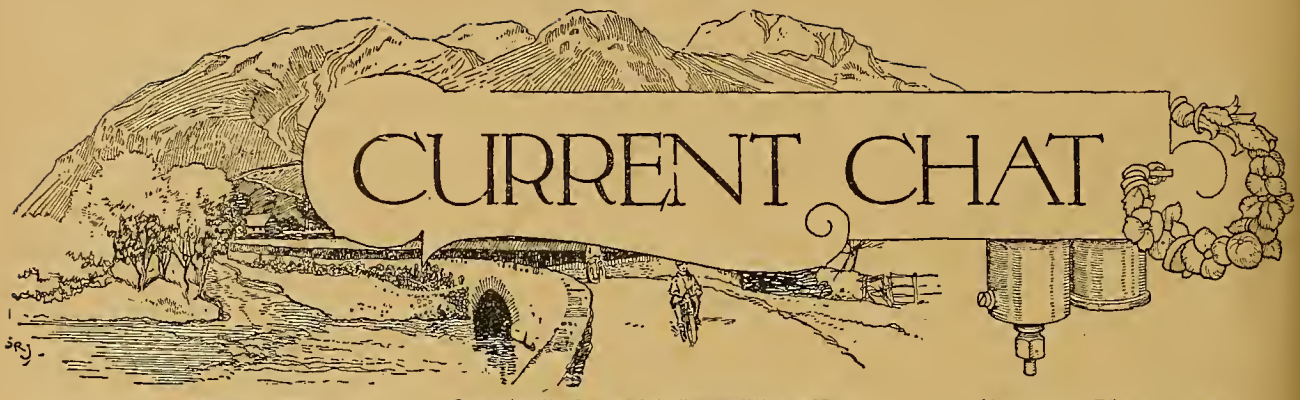
The R. and P. pulley is controlled by a long lever on the side of the tank.

AN EXTRAORDINARY CASE.

SOME unusual evidence was given at a recent case which was heard before the Southend justices, wherein a motor cyclist was charged on various counts, including that of riding to the common danger.

Apparently the defendant had been riding up and down the promenade, and when turning in the road was in some danger of colliding with the principal witness, who seemed to lose his nerve on the approach of the machine. The motor cyclist avoided the informant, who called upon him to stop, and, this being unheeded, witness made efforts to catch him with his walking stick. Being unable to do so, on another occasion he revisited the spot with the avowed intention of making a further attempt to seize the rider, and when the latter approached, witness, to use his own words, "made a grab at him." Again failing, he complained to the police, and, despite the fact that the other witnesses estimated the motor cyclist's speed at about 10 m.p.h., against his allegation of "40 to 45 m.p.h. and in his own mind faster" (whatever that may mean!), the defendant was convicted and fined £10 on the charge of driving to the common danger.

The seriousness of the case, as far as the motoring public is concerned, lies in the fact that throughout the proceedings there was no condemnation of the witness's attempt to catch a rider who had in no way injured him, nor reprimand for his second visit to the spot with the preconceived plan of waylaying and seizing the man. Furthermore, when cross-examined as to his knowledge that his actions might easily have resulted in throwing and causing the death of the motor cyclist, he cheerfully admitted that to have effected this would have given him great pleasure.



Times to Light Lamps.

SUMMER TIME.

Aug. 21st	...	...	9.11 p.m.
,, 23rd	...	...	9.7 ,,
,, 25th	...	...	9.2 ,,
,, 27th	...	...	8.58 ,,

Lighting-up Time.

Now that the special lighting regulations under D.O.R.A., which were in force during the war, are rescinded, the time to light up is one hour after sunset.

A Stolen Motor Cycle.

One of our readers, Mr. H. C. Lipper, Egremont, 64, Croxted Road, Dulwich, London, S.E.21, has had a Canadian War Office model Indian stolen, registered number T399. The sidecar is fitted with a hood and screen, but the door is missing.

A Famous Lady Motor Cyclist.

Miss Toupie Lowther—who is a keen motor cyclist—and her companions are now demobilised. This gallant lady formed a unit of Englishwomen who took part in the front line work of the French Army during two and a half years of hard fighting. She was given the rank of lieutenant in the French Army, and insisted upon working in the front lines. She and her companions had to go into a fighting unit with the French Army, as they have no French Red Cross at the extreme front. For four months Miss Lowther's unit justified their existence by carrying over 10,000 wounded.

Opportunity for Welsh Competition Riders.

A special prize of fifteen guineas is being offered by Tom Norton, Ltd., the well-known motor agents, of Llandrindod Wells (around which place the Six Days course will radiate), for the best performance in the trials by any competitor who was born in Wales of Welsh parentage.

A Motoring Dog Lost.

A wire-haired terrier, black and tan head, body mostly black, white spot in rear, is missing. She is accustomed to riding in a Harley-Davidson and Triumph sidecar, and may attach herself to one of these. She also comes to a police whistle or motor horn, and answers to the name of "Stodger." A reward of £10 will be paid for her recovery by her owner, Mr. G. H. Buley, The Link, Woodnesborough, Sandwich.

The Ricardo Slipper Piston.

We recently had an opportunity of testing a 3 h.p. Enfield fitted with Ricardo slipper pistons. These pistons were first described in the issue of March 15th, 1917, page 235. The pistons are extremely light. There is practically no skirt, except for the two slippers on the sides which are subjected to thrust owing to the angularity of the connecting rods, and the gudgeon pin is carried by ribs connected with the piston head instead of being carried by the piston walls. These slippers are drilled, and this not only still further lightens the piston, but, more important still, breaks up the film of oil between the piston and cylinder walls, thereby greatly reducing the shearing friction between the two. In the later Ricardo piston the top is of smaller diameter, and the slippers have less clearance at the grooves which take the rings. The machine ran extraordinarily smoothly, and was quite lively.

Special Features.

NOTES ON SCOOTERS.
NEW DESIGNS.
THROUGH FEMININE GOGGLES.

Warning to Six Days Trial Entrants.

The A.C.U. wishes to remind entrants in the forthcoming Six Days event that no motor cycles having any part of German, Austrian, Bulgarian, or Turkish origin or manufacture will be eligible to compete. This also applies to any open competition promoted by the Union, except those of international character.

Machines or parts made previous to August, 1914, are not included in this ruling.

Motor Cycling in Italy and Switzerland.

In Italy at the present time there are no special restrictions regarding the use of motor cycles by foreigners, and there is a general reversion to former conditions. Tourists must be provided with a *sauf-conduit* as well as their passport, which is issued by the Italian Military Gendarmerie.

In Switzerland the same regulations obtain, as regards customs, as before the war. In nearly all cantons cut-outs are forbidden. In villages and towns horns giving a deep note are the only warning signals permitted, and the speed must be moderate; in the open country twenty-five miles an hour. Drivers must be at least twenty years of age. Petrol is one franc a litre, and tyres are scarce. Full information can be obtained from the Touring Club of Switzerland, 9, Boulevard du Théatre, Geneva.

Shortage of Motor Spirit.

According to a report from the A.A., tourists have recently experienced trouble in obtaining fuel in various parts of the country.

Many were specially fortunate in Scotland, and the A.A. immediately got in touch with the National Benzole Association, who have taken urgent steps to forward supplies to the affected districts.

Several motorists are hung up in Scotland, and all travelling over the border should carry supplies to ensure their return to the North of England.

The start of one of the classes at the Bristol M.C. Club's Hill-climb at Blagdon. The classes were run off in pairs, and in both solo and sidecar events Douglases took premier awards.

New Index Letters for London.

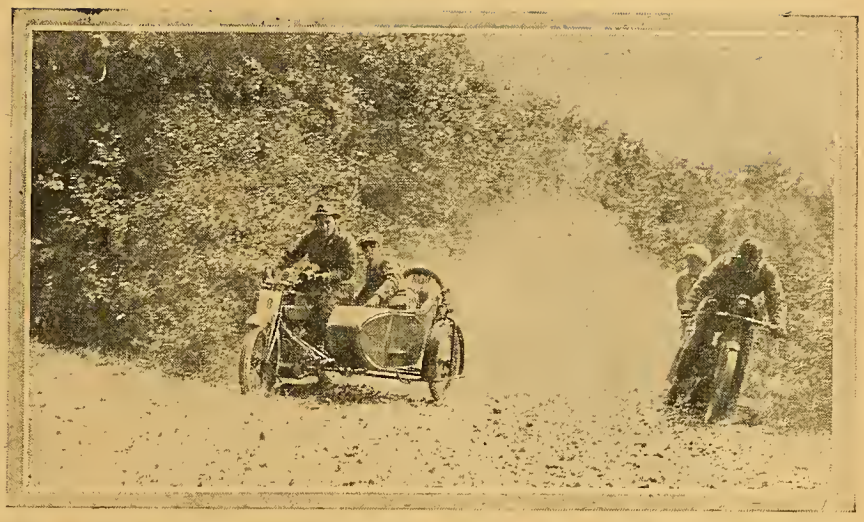
Despite the already long list of index letters for motor vehicles registered in the County of London, it has been found necessary to allot still another, the latest addition being LY.

The A.C.U. Six Days Trial.

Up to the time of going to press the following entries had been received for the A.C.U. Six Days Trial: Cather Cooke (4 Triumph), J. Dosher and D. Guise (8 Enfield sc.), Godfreys, Ltd. (Indian), Ernest Cross (Triumph), S. J. Watson (Ariel), T. Rutherford (Sunbeam), and Howard R. Lane (B.S.A.).

The National Roads Committee.

Thanks to the efforts of Sir William Joynson-Hicks, M.P., Lord Montagu, and the Motor Legislation Committee, a National Roads Committee has been formed within the Ministry of Transport for the purpose of giving advice to the Minister with respect to the roads and the traffic thereon. This Committee will consist of not less than eleven members, five of whom shall represent highway authorities, five the users of horse and mechanical road traffic, and one representative of labour. It is important to note that the appointment of the Roads Committee will be obligatory upon the Minister, and it will not be a Committee of Ministerial nominees; moreover, the Committee's activities will not be limited to matters referred to it by the Minister. It will make its own regulations, meet as often as it pleases, and elect its own Chairman. The Minister will be called upon to consult the Committee as well as the local authorities with regard to the classification of roads upon which grants for roads so largely depends.



Rex Mundy piloting his Matchless in the S.E. Counties Inter-club Team Trial (see page 206 and 207).

IMPORTANT DATES.

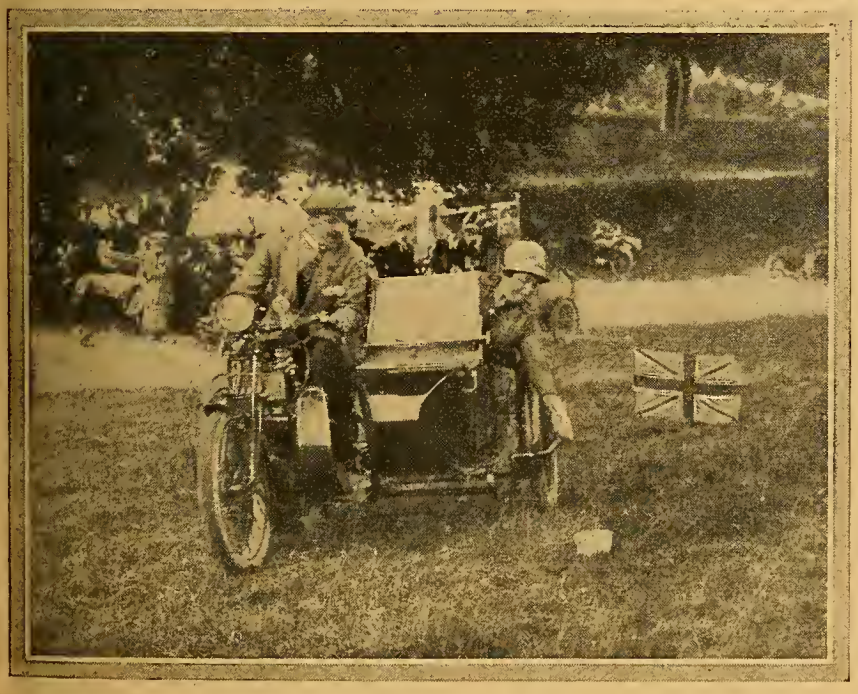
A.C.U. Six Days Trial, Sept. 15th to 20th.

Paris Salon, Oct. 9th to 19th.

Olympia Car Show, Nov. 7th to 15th.

Olympia Motor Cycle Show, Nov. 24th to 29th.

Brussels Show, Dec. 8th to 13th.



On Saturday last the Hull and East Riding Autocycle Club were entertained by Major A. J Atkinson at Elloyliton Dale, where sports, etc., were held. The photograph shows W. Jackson (8 h.p. Sunbeam) in the potato race. He was awarded the cup for the smartest turnout.

The Open Trial of the Redditch and District M.C.C.

We hear that the Redditch and District Motor Cycle Club's open reliability trial, to be held on Saturday, is to be over a course that will test to the utmost both riders and machines. There is talk of including a hairpin bend on a gradient of 1 in 3.

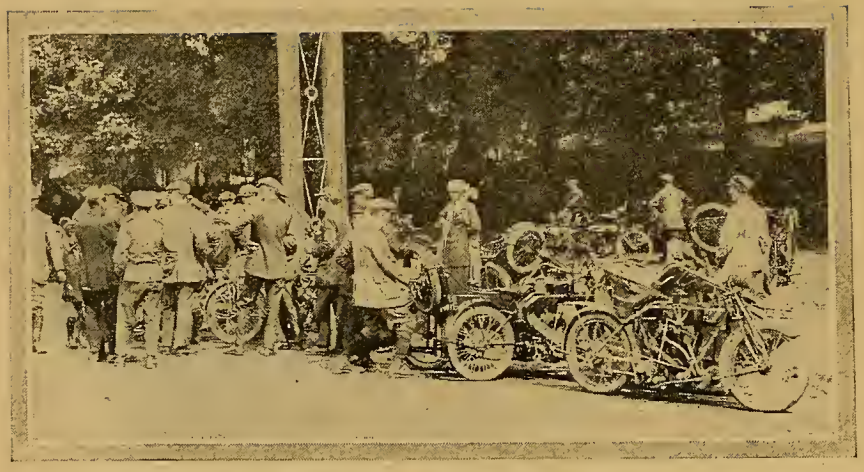
The Honours List.

In the honours list which appeared recently the names of Sir William Joynson-Hicks, Bart., M.P., and Sir Julian W. Orde appear. The public services of the former are familiar to the majority of readers, and his recent efforts on behalf of motorists in connection with the Transport Bill no doubt will be recollected. Sir Julian, secretary of the R.A.C., has been knighted chiefly for his services in connection with the war.

The Motor Cycling Club Team Trial.

Promise of excellent support by the clubs for the M.C.C. Team Trial for *The Motor Cycle* Cup is evident. Up to the present time, fifteen clubs have made application for entry forms. These are: The Sheffield and Hallamshire M.C.C., the Eastbourne and District M.C.C., the Birmingham M.C.C., the Camberley and District M.C.C., South Birmingham M.C.C., the Oldham and District M.C.C., the Woolwich, Plumstead and District M.C.C., the Nottingham and District M.C.C., the Public Schools M.C.C., the Essex M.C., the Middlesex M.C.C., the Ealing and District M.C.C., the Liverpool M.C., the Coventry and Warwickshire M.C., the Sutton Coldfield and Mid-Warwickshire M.C.C., and the Oxford M.C.C. An exceedingly sporting course has been found which, however, is somewhat complicated, and will need careful arrowing; consequently, any motor cyclists who will act as marshals should send in their names to the secretary, Mr. Southcomb May, 34, Gower Place, London, W.C.2. The headquarters of the trial will be at Tring, and the start will be close by that town.

The S.E. Counties Inter-club Team Trial.



The start of the South Eastern Counties Inter-club Team Trial on Saturday last.

FIVE teams assembled at the "Rose and Crown," Green Street Green, Orpington, Kent, on Saturday last, August 16th, in readiness to start on the sixty miles inter-club reliability trial organised by the Woolwich, Plumstead, and District M.C.C.

A few minutes after 2 p.m. instructions issued by Mr. F. J. Ellis, the officiating secretary, brought the competitors into line at the starting point. Many types of machines were represented, although the Woolwich team, with the exception of one member astride a 3½ Ariel, all rode Matchless machines.

At the start we noticed a 2¾ Douglas, ridden by J. Bateson (Streatham), which, although many years old, subsequently proved to be the only successful lightweight entered. It made a splendid performance throughout the trial, and the rider, as one of the winning team, gained one of the gold medals.

The teams were made up of six riders, one team each being entered by the Streatham, Woolwich, Brookdale, Rochester, and Cambridge Motor Cycle Clubs respectively, and twenty-eight starters got away well. The trial route lay within a comparatively small area, and the arrowed route to be followed was arranged to cover the necessary sixty miles, which, at a speed of 20 m.p.h., had to be completed in three hours.

Narrow Roads.

From the start, the course led up one of the narrow and closely-hedged roads, familiar in the district, through the village of Downe and Cudham, to Westerham. With the last-named village retiring into the distance, and whilst still ascending, the competitors set their teeth in preparedness for the beginning of the real test of both machine and rider, for ahead was the first of the difficult hills included in the run.

The only trouble reported on Chalk Pit (Salt Box Hill), however, was that the stony surface accounted for back wheel spin with the heavier machines.

Leaving the arrowed route, which next passed through Polsteeple, and, taking a short cut in order to intercept the riders at Cudham Hill, we soon found that the bad surface of this hill would probably cause no little difficulty.

The first rider round the awkward bend near the summit was G. Jenner (4 Triumph), who made a good fast climb. Not so successful as he, however, the rider of a 2½ h.p. Levis, "konked out" within a few yards of the top, but, by a plucky effort, managed, with the aid of his foot, to propel his machine to the top, this procedure, however, robbing him of an award.

H. A. Collier (8 Matchless sc.) made a slow but steady climb, as did Glendenny (A.J.S. sc.). A fast ascent was accomplished by S. A. Ive (4 Triumph), who skilfully passed A. Daw on a similar mount, the latter by no means climbing slowly.

The loose surface of the hill gave E. Atkins (3½ Ariel sc.) a little trouble, his lady passenger usefully applying her weight in an attempt to hold the rear wheel to the road. Ascending well, H. V. Colver (8 Matchless sc.) had his two boys as passengers, and their faces, whilst climbing the worst part of the gradient, did not portray a feeling of great pleasure; nevertheless, they appeared thoroughly to enjoy the run.

Loose Surface on Hills.

The next observed hill to be encountered was Crown Ash, and in spite of its steep gradient and appallingly bad surface, across which were many ruts formed by the rain from the neighbouring hills, many successful climbs were made.

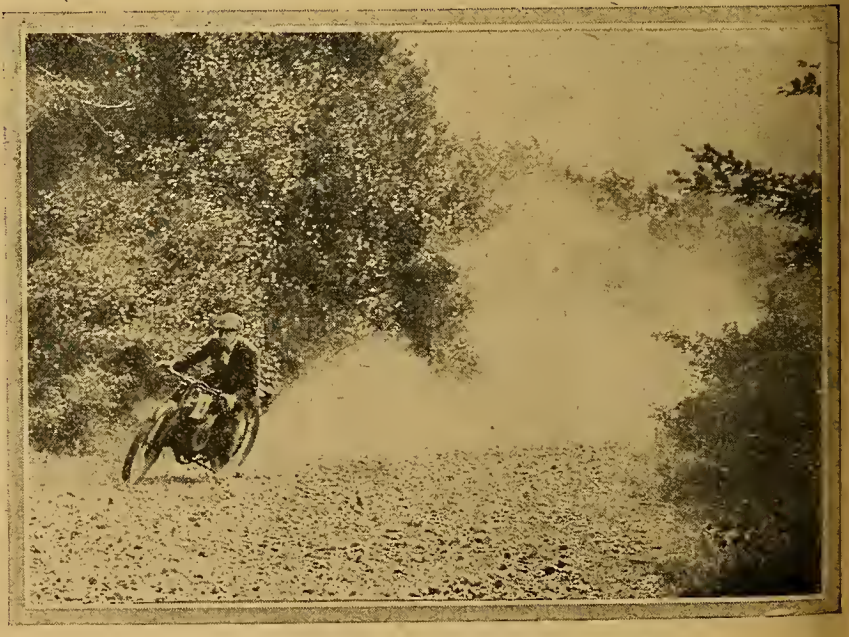
G. Jenner (4 Triumph) made a fast climb. His speed, however, was a little too great for the loose surface, but after wobbling dangerously for several yards and eventually colliding with the bank, he pluckily continued and reached the summit successfully.

The 2¾ Douglas, piloted by J. Bateson, also made a fast climb.

An uncomfortable method of ascending the hill was adopted by Rex Mundy (Matchless sc.), who, owing to severe wheel spin, was obliged to bump his saddle to retain a grip of the road.

One unfortunate victim of the hill was D. Jones (4 Triumph), who, after swerving across the track at a dangerous angle, was obliged to stop.

After the ascent of the hill the route lay along the Westerham Road, on the right of which a beautiful valley, dotted with a number of closely wooded areas, stretched as far as the eye could see, whilst on the left the summit of the ridge, along which the road wound its snakelike course, was silhouetted against



J. Bateson (Douglas) going well on one of the test hills

Many Well-known Kentish Hills included in a Sporting After-noon Trial

C. R. Collier on Brasted Hill. The machine he rode was a new spring frame Matchless.

ne clear, blue sky. Passing through the ncient valley of Hogtrough, the well-nown Brasted Hill was descended, the oad then straightening out into Sun-ridge, and then to Knockholt.

A duplicate route was next followed hrough Dunton Green and Sevenoaks, eturning up Toy's Hill, a long and teady climb, to Brasted Hill, descending gain to the finishing line at the "Three Horse Shoes" at Knockholt.

Lieut. E. S. K. Evans-Greaves, R.N. (Triumph), on Crown Ash Hill

Most of the competitors ascended Brasted successfully, wheel slip again being a general difficulty.

Success for the Streatham Team.

G. F. Hunter (8 Matchless sc.), however, fell a victim to plug trouble, but was the only member of the Streatham team to retire, resulting in an easy win for that club on the number of non-stop finishers only, the errors in time being totally ignored.

The runners-up, however, the Brookdale team, had a total error of 20m. 4½s., whilst the winners, Streatham, carried off both the Woolwich challenge cup and the gold medals, and had a total eror of 4m. 37⅘s. only, a decidedly good performance.

The Club Teams.

STREATHAM TEAM (Winners of Woolwich Challenge Cup).
J. Bateson (2¾ Douglas), gold medal.
Rex Mundy (6 Matchless sc.), gold medal.
W. S. Cooper (3½ Triumph), gold medal.
G. F. Hunter (8 Matchless sc.), retired with plug trouble.
A. Daw (4 Triumph), gold medal.
F. S. C. C. Paterson (4 B.S.A.), gold medal.

WOOLWICH TEAM.
G. D. Hardee (8 Matchless sc.).
E. Atkins (3½ Ariel sc.).
H. A. Collier (8 Matchless sc.).
C. R. Collier (8 Matchless sc.).
H. V. Colver (8 Matchless sc.).
A. R. C. Ilsley (8 Matchless sc.).

BROOKDALE TEAM.
Reg. Boxer (4 Triumph sc.).
T. J. Ross (4 Triumph).
J. A. Hoult (8 Matchless sc.).
B. J. Sims (4 Triumph).
A. M. Dobson (4 Triumph).
S. A. Ive (4 Triumph).

ROCHESTER TEAM.
G. Jenner (4 Triumph).
Gilmour Packman (8 Zenith).
Duncan Jones (4 Triumph).
L. C. Rumens (3½ P. and M.).
Leslie Skinner (4 Rover).
G. Skinner (4 Triumph).

CAMBRIDGE TEAM.
E. S. K. Evans-Greaves (3½ Triumph).
T. F. H. Marriott (3½ Norton).
—. Glendenny (A.J.S. twin sc.).
W. A. Fell Smith (8 Blackburne sc.).
R. Hovenden (3½ Norton), non-starter.
F. A. Knight (8 Zenith), non-starter.

A competitor passing a less fortunate rider on Crown Ash.

WELCOME HOME TO BIRMINGHAM RIDERS.

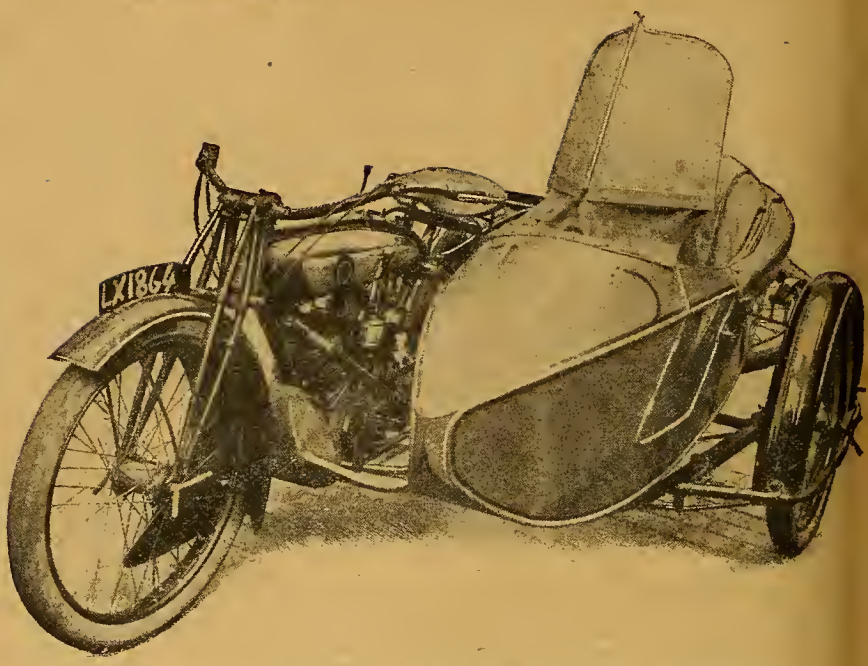
In order to acknowledge suitably the services rendered to their city and country by local motor cyclists, Birmingham and district riders are making big efforts to give them a welcome home, and a gathering will be held in Birmingham in the autumn, which will take the form of a dinner and concert with, possibly, presentations. It is hoped that the scheme will be taken a step further, and everything will be done to assist those who have not yet settled to congenial employment. Any Birmingham motor cyclist who has drawn service pay since August 4th, 1914, is eligible, provided he was a motor cyclist prior to that date or has served as a motor cyclist since in any branch of H.M. Forces, and the committee desire such men to send their names to the hon. secretary, Mr. R. H. Henderson, Midland Wheel Club, Queen's College, Birmingham.

A French Machine for the British Market.

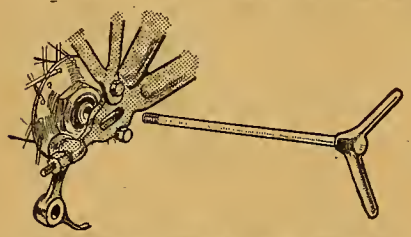
The 8 h.p. G.L. Sidecar, embodying English Engine and Gears.

IT is not often one sees a French motor cycle in England, but recently we had an opportunity of examining the G.L., which was brought round to our offices by M. Charles Sweerts, who is well-known in the Midlands, and was formerly with the Singer Co., Ltd.

The G.L. is manufactured by M. Georges Levy, Rue Michel Carré, Argenteuil, France, who, during the war, was a manufacturer of seaplanes. The G.L. is distinctive, in that it employs numerous British parts, such as a J.A.P. engine, Sturmey-Archer three-speed gear, and Amac carburetter. There are, however,



Threequarter view of the G.L. The wheel spindles can be removed without tools.



The detachable wheels are easily manipulated.

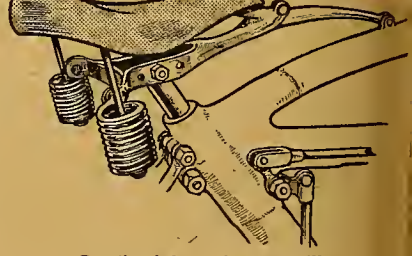
several interesting features concerning the frame and its fittings.

The front forks deserve special mention, being intensely strong and yet reasonably light, and being a combination of the Triumph pattern fork and the ordinary pattern. Not only are the forks pivoted at a point above the wheel, but an up and down movement is imparted to them through the vertical enclosed springs contained in tubes running from links at the top of the forks to a spindle running across the fork crown at the bottom of the steering post.

In the G.L. all wheels are detachable and interchangeable, and no tools are required to remove them, as each spindle bolt is provided with long arms so that it can be undone easily by hand and yet be sufficiently tightened by the same method so as not to become loose.

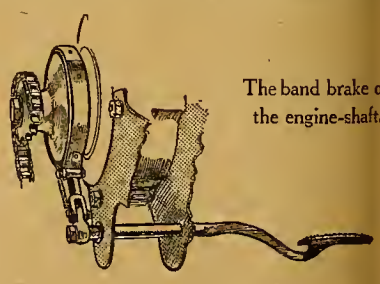
So far as the rear suspension is concerned, this is effected by mounting the saddle pin on a spring, the saddle peak running and sliding on a long rod attached to a lug on the frame top tube. The G.L. is particularly well equipped as regards brakes, and of these one is a distinct novelty, as it is of the external band variety applied to a drum on the engine-shaft and controlled by a pedal within easy reach of the rider's heel. It is most effective in action, and though the braking stresses are taken through the transmission, in the event of the failure of the transmission the rider still has a very powerful means of stopping in the internal expanding band brake in the rear hub. Noteworthy features of the G.L. are the wide and comfortable handle-bars and the spacious aluminium footboards.

The sidecar chassis is light but of great strength, while the body, which is most comfortable, bears some resemblance



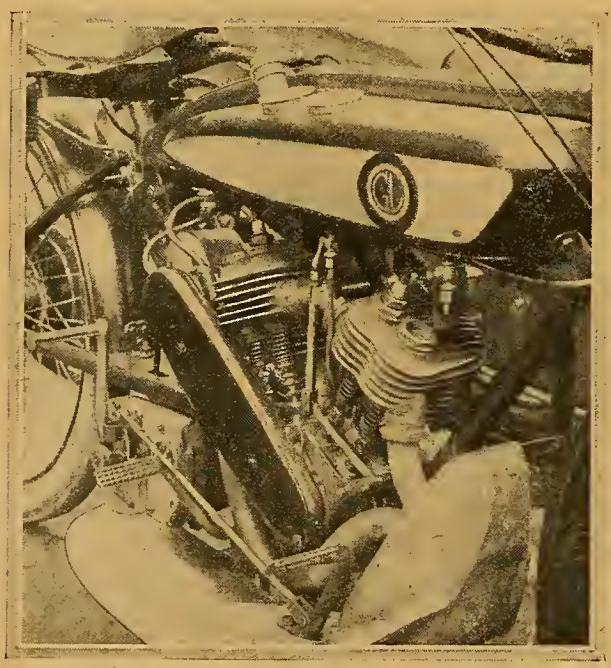
Details of the spring seat pillar.

to the boat body of a seaplane. The hood folds neatly away, and when out of action is protected by a cover. When erected it forms ample protection for the passenger, as it fastens neatly over the



The band brake on the engine-shaft.

top of the V shaped celluloid screen. The G.L. is handled in this country by Messrs. Vivian Hardie and Lane, Ltd., 24, Woodstock Street, Bond Street, London, W.1.



Peculiarly shaped silencer and spacious footboards are noticeable features of this French production.

Coventry and Warwickshire M.C.

The Coventry Club is holding a "go-as-you-please" 100 mile trial on Saturday next, starting from Davenport Road, Coventry, at 1 p.m. Entries (2s. 6d.) close to-day (Thursday 21st).

Wolverhampton M.C.C.

The trial to Barmouth arranged for last Saturday, was postponed owing to the proximity of the inter-club trial on the 30th inst., when it is hoped the Sutton Coldfield, Birmingham, and Hereford Clubs will combine with the Wolverhampton Club in a 100-mile trial over difficult cross-country roads.

Bristol M.C.C.

The annual speed trials (open and closed) will be held at Weston-super-Mare on Saturday, August 30th. There will be ten open classes and seven reserved for club members, and the course will be over a one mile stretch on the sands.

Entry forms and full particulars of the event may be had from Mr. P. Grout, Keynsham, near Bristol. Entries close on Saturday, August 23rd.

In the recent members' hill-climb, with the exception of the 275 c.c. class, in which A. E. Tozer (2½ O.K. Junior) was first, all the solo classes were won by E. Kickham (2¾ Douglas), who thus gained five first places.

Three of the four sidecar awards likewise went to S. L. Bailey (2¾ Douglas sc.), the remaining one being taken by H. Bradshaw (5 Clyno).

Liverpool M.C.

In connection with the meet at Monsal Dale on the 10th inst., the above named club held a speed-judging competition on the way back to Liverpool, between Buxton and Macclesfield. Competitors were timed over an unknown stretch by two concealed timekeepers, and were to average 20 m.p.h. The results were as follow :

SOLO CLASS.

	Secs. error.
Mr. Rose (3½ Rover), winner	2
Lt. Walker (2¾ Douglas)	3
Miss Cottrell (2¾ Calthorpe)	11
Mr. Cottrell (Triumph)	15
Mr. Parker (2¾ Coulson B.)	30*
Mr. Fox (4 B.S.A.)	30*
Mr. Hague (American Excelsior) ..	53
Mr. Wade (2¾ Sun)..	65

* Tie.

SIDECARS.

Mr. Lane (6 A.J.S.), winner	1
Mr. Jones (6 A.J.S.)	3
Mr. Honeyman (6 A.J.S.)	5
Mr. Meskuita (6 A.J.S.)	20
Mr. Raine (6 A.J.S.)..	30
Mr. N. Brown (Indian)	42*
Mr. R. H. W. Brown (A.J.S.)	42*
Mr. Wade (A.J.S.)	72

* Tie.

Future Events.

Aug. 22-23.—Essex M.C. 24 Hours Ride to York and Back.
Aug. 23.—S. Birmingham M.C.C. Run to Stratford-on-Avon.
Aug. 23.—N.M.C.F.U., Portsmouth. Run to S. Hayling.
Aug. 23.—Coventry and Warwickshire M.C. "Go-as-you-please" Trial.
AUG. 23.—BIRMINGHAM M.C.C. OPEN HILL-CLIMB.
Aug. 23.—Glasgow M.C.C. Reliability Trial.
Aug. 24.—Reading and District M.C. and L.C.C. Surprise Run.
Aug. 24.—Westmorland M.C.C. Reliability Run for Triumph Cup.
Aug. 24.—Ilkley M.C. and L.C.C. Speed Trial and Hill-climb for Dawson Trophy.
Aug. 24.—N.M.C.F.U. Inter-meet at Newtown Linford.
Aug. 24.—Stalybridge and District M.C. Run to Matlock.
Aug. 24.—Manchester M.C. Gymkhana.
Aug. 24.—N.M.C.F.U., Sheffield. Run to Lincoln.
Aug. 24.—N.M.C.F.U., Portsmouth. Run to Epsom Downs.
Aug. 24.—N.M.C.F.U., Leeds. Run to Grassington and Buckden.
Aug. 24.—Rochester, Chatham, and District M.C. Run to Wateringbury.
Aug. 28.—Stalybridge and District M.C. General Meeting at 7.30.
AUG. 30.—WOLVERHAMPTON M.C.C. OPEN RELIABILITY TRIAL.
Aug. 30.—S. Birmingham M.C.C. Hill-climb.
Aug. 30.—N.M.C.F.U., Sheffield. Week-end Run to Boston.
Aug. 30.—N.M.C.F.U., Portsmouth. Run to Halnaker.
AUG. 30.—BRISTOL M.C. SPEED TRIALS AT WESTON-SUPER-MARE.
Aug. 30.—Wolverhampton, Sutton Coldfield, Birmingham, Hereford M.C.C.'s Inter-club Trial.
Aug. 30.—Public Schools M.C.C. Hill-climb.
Aug. 31.—N.M.C.F.U., Leeds. Soldiers' Outing.
Aug. 31.—Ilkeston and District M.C.C. Run to Matlock.
Aug. 31.—N.M.C.F.U., Portsmouth. Run to Hayling Island.
Aug. 31.—Stalybridge and District M.C. Run to Rhyl.
Aug. 31.—Birmingham M.C.C. Social Run.
Aug. 31.—Rochester, Chatham, and District M.C. Run to Hawkhurst.
Aug. 31.—Woolwich, Plumstead, and District M.C. Picnic and Gymkhana at Brasted Hill.
Aug. 31.—Reading and District M.C. and L.C.C. Run to Kop Hill.
SEPT. 6.—M.C.C. TEAM TRIAL FOR "THE MOTOR CYCLE" CUP.
Sept. 6.—Birmingham M.C.C. Reliability Trial for Sangster Cup.
SEPT. 6.—YORK AND DISTRICT M.C. OPEN HILL-CLIMB AT SUTTON BANK.
SEPT. 15-20.—A.C.U. SIX DAYS RELIABILITY TRIALS.
Sept. 19.—Essex M.C. Gymkhana.
Sept. 20.—Blackburn and District M.C.C. Hill-climb on Waddington Fells.
Sept. 27.—Coventry and Warwickshire M.C. Hill-climb.
Sept. 27.—Wolverhampton M.C.C. Open Hill-climb.

N.M.C.F.U. (Birmingham).

Members are asked to turn out in force for the inter-meet at Newtown Linford. Meet at Fox and Goose Hotel, Washwood Heath, at 10.45 a.m., on August 24th.

Westmorland M.C.C.

A reliability run for the Triumph cup and other prizes will be held on the 24th inst., starting at 9.30 a.m. from the Grammar School, Kendal. Route cards will be sent on receipt of entry fee, 1s., which will be received up to-morrow, the 22nd, or at the start at double fees.

Warrington M.C.

The Warrington and District Amateur Motor Cycle Club has been re-formed and re-named the Warrington Motor Club. All motorists interested are invited to communicate with Mr. H. Aldred, 58, Church Street, Warrington, who is occupying the post of secretary. The club, which will hold a reliability trial on August 24th, has met with excellent support, but further members will be heartily welcomed.

Public Schools M.C.C.

An enjoyable run was recently made by members of this young and growing club to Hayling Island, where the party indulged in a most enjoyable bathe. The membership is increasing, and during this month the club is making a special effort to run competitions in which present members of public schools may take part.

Ilkley M.C. and L.C.C.

The old Ilkley and District M.C.C. has been re-formed under the title of the Ilkley Motor Cycle and Light Car Club, with headquarters at the Crescent Hotel, Ilkley. Mr. W. H. Sellers is the hon. sec. Local motor cyclists who are interested should communicate with him at Langley Avenue, Bingley. The results of the recent reliability trial are as follow :

	Marks lost.
1. W. R. Haggas (8 New Imperial), gold medal	8½
2. H. O. Wood (Scott), silver medal	12½
3. W. S. Crothers (4 Triumph sc.), bronze medal	17
4. W. Bradley (6 Royal Enfield sc.)	17½
5. N. O. Vinter (Scott sc.)..	25½
6. S. Haigh (Scott)	44½

Blackburn and District M.C.C.

The Blackburn Club is holding a hill-climb on Saturday, September 20th, on Waddington Fells, near Clitheroe, when the following events will be run off, commencing at 1.30 p.m. :

Class 1.—Motor scooters.
Class 2.—Light cars up to 1,500 c.c.
Class 3.—Lightweights up to 270 c.c.
Class 4.—Lightweights up to 350 c.c.
Class 5.—Standard touring machines up to 560 c.c.
Class 6.—Sporting machines up to 560 c.c.
Class 7.—Machines up to 750 c.c.
Class 8.—Unlimited.
Class 9.—Passenger class up to 560 c.c.
Class 10.—Passenger class (unlimited).

Further information, schedules, and entry forms may be obtained on application to the hon. sec., W. Geo. Guest, 9, Exchange Street, Blackburn. Entries close September 12th. Application for membership should be made to the secretary.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

THE "BIG FOUR."

Sir,—We notice a letter in your issue of July 24th under the above heading. Reference to *The Motor Cycle* file will show that we were advertising in your columns a 4¼ h.p. model (single) of our make as far back as 1907. That size did not become popular at the time, hence we did not push it seriously, at any rate for the home markets.

As sidecars became more popular, we redesigned this model, and exhibited types at the 1911 show, for the 1912 season; you reviewed that model in your criticism of the 1911 show.

We have, in recent years, slightly enlarged this model, and now style it 4¼ h.p.

In view of the criticism appearing in your columns recently with regard to some clear definition as regards horse-power, it may interest you to know that even in 1912 we found the usual definition of horse-power somewhat misleading, and preferred to state the dimensions.

THE LLOYD MOTOR ENGINEERING CO., LTD.

THE SCOOTER DEFINITION.

Sir,—Referring to the letter appearing in your issue of August 14th over the *nom de plume* "Puzzled," I feel that your note clearly explains the definition to him. At the same time, I should like to amplify this by giving the reason of my Committee's decision on the matter of platform space. It is felt that the scooter would defeat one of its objects were it in any way difficult to mount or dismount—particularly in the case of lady riders, who would certainly be wearing skirts for this form of locomotion. It seems essential, therefore, that an entirely open frame should be used, thus permitting the rider to place either foot or, in case of emergency, both feet on the ground without fear of "tripping" over anything in the nature of a cross-member, however low. Your correspondent will notice the words "centre portion"—indeed he quotes them—and the object of this section of the preliminary definition was to eliminate frames following the practice of ladies' motor cycles or ladies' pedal cycles. It is considered that a *clear* centre portion of twelve inches allows ample room for standing, and provides no obstacles for mounting or dismounting.

T. W. LOUGHBOROUGH,
Secretary Auto Cycle Union.

PLEASE QUOTE PRICES!

Sir,—Your correspondent R. W. Paul in the issue of August 7th speaks of "illogical" statements regarding the discourtesy shown by some firms in the answering of enquiries. Would not he be speaking more logically were he to say: "*The Motor Cycle* is a medium of information. Its readers search its pages for detailed information, and not for misleading or illusory matter. I will see that my adverts. contain a clear account of my position to deal with the would-be patron. In so doing, I shall eliminate unnecessary correspondence, my clerical staff will not be 'hopelessly overtaxed,' I shall establish a true understanding and so safeguard the reputation of my firm."

I think R. W. Paul and others would do well to adopt this procedure.

L. A. JOHNSON.

Sir,—Mr. R. W. Paul's letter, in your issue of August 7th, offers no excuse whatever regarding the statement in my letter in your issue of July 24th, which is far from being wholly illogical, since many manufacturers invite enquiries in their advertisements. If they are overtaxed, and their works and offices are congested, why invite enquiries? If they cannot cope with them, the only reasonable solution is to word advertisements in a different manner, whereby they could still keep their names before the public without being worried to any extent; or, on the other hand, many thousands of demobilised soldiers who are walking the streets in search of work would be pleased to deal with manufacturers' correspondence were they given the chance. It is well to acknowledge correspondence if a full reply cannot be made at once; thereby customers may be held for a reasonable time. No acknowledgment sends customers elsewhere. I still contend that prices should be quoted, with details of machines or parts in all advertisements.

H. F. BARTLETT.

SPEED WOBBLE.

Sir,—I would be glad if you would insert my experience of a speed wobble I had the other day. I was trying a new Rudge-Multi I had never ridden before, and was doing about 60 or 65 m.p.h., as I had full throttle and a good wind behind me on a flat road, or, if anything, a slight downward slope, with a top gear ratio of 3½ to 1. As soon as I felt the wobble I shut the throttle, and used all my will power to hold the machine straight, but the wobble increased until I had gone another hundred yards down the road and got into some thick dust at the side, when the front wheel skidded, and I was precipitated on to the road.

I should be very glad to hear a good theory on the cause of speed wobble, and the best means to overcome it. I might mention I did not attempt to use brakes to pull myself up, but just shut the throttle and hung on. G.E.S.
Sheffield.

ARMY HUTS.

Sir,—These are being extensively advertised for sale. Some are useful for conversion into bungalows and garages, but motorists who think of buying Army huts for storing their cars or motor cycles in would be well advised to obtain a copy of the local byelaws, and study the list therein of exempted buildings.

Byelaws vary in different districts, but, generally speaking, the question whether a building like an Army hut can be put up depends upon its size (length × width × height) and its positional proximity to existing buildings, and to its owner's own property boundaries. Also, such a building should not project beyond the general building line of houses, etc., without some precedent.

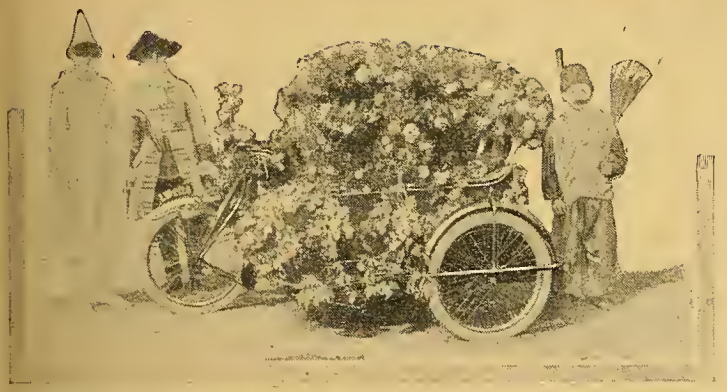
Applications for copies of the building byelaws should be made to the engineer or surveyor to the local council.

HENRY JAMES WISE, F.R.I.B.A.

THE VALUE OF THE AUTOMOBILE ASSOCIATIONS.

Sir,—I have been reading with interest in your issue of August 7th the testimony of R. Politi to the value of the automobile associations. I also have heard these associations criticised, and used to wonder whether they *did* give anything of value in return for the subscription. However, I joined the A.A., and on Whit-Monday started southward on my first tour with a sidecar combination. We did 110 miles by 8.15 a.m., and then sat down on the roadside just north of Bawtry for breakfast. On rising to resume the journey I found my back tyre was flat. Almost before I had time to lament the delay which this would involve, a quiet voice behind me enquired as to the trouble, and I turned to find the A.A. patrol ready to assist. We passed on to London, through Surrey, along the Thames valley, and back through the Midlands, and whenever trouble threatened or difficulties arose there was an ever-ready A.A. man at hand. Some may say I was fortunate, but I attributed my good fortune to the familiar badge carried on my handle-bar.

(Rev.) F. A. RAINBOW.



The sidecar lends itself admirably for fancy decoration, as will be seen by the prettily decorated Douglas outfit which was present at a recent carnival at Potter's Bar.

THE SIDECAR IN CARNIVAL.

Sir,—I am forwarding a photograph of my sister's 4 h.p. Douglas combination, decorated at a recent carnival at Potter's Bar.

The base of the design was the Lord Mayor's coach, and the flowers were supported on a cane canopy and by strings around the car.

Readers may be interested in this photograph, as it shows that a sidecar outfit can be made very gay without the use of a single piece of bunting. Much of the beauty is, of course, lost owing to the lack of colouring in the photograph.

CLIFFORD W. TINSON.

STEERING.

Sir,—With reference to "Chinook's" statement that he has ridden machines easier to steer than the new Douglas, does it not suggest, from the photograph accompanying his article in *The Motor Cycle* of August 7th, that the apparent weight on the carrier may have had something to do with his finding? The machine I ride (a 3½ h.p. single Rover), to me, seems faulty in the steering, and I came to the conclusion that the weight of engine, etc., is carried too far back. The least downward tilt of the saddle at the rear, and consequent removal of the rider's weight further back, seems to make the front wheel light and render steering more difficult.

The Scott, to my mind, and the P. and M., with their engine units in a forward position, counteract this front wheel lightness, and make steering easier. Unfortunately, my opportunity of gaining practical proof or otherwise of my theory is somewhat limited, and therefore I should like to read "Chinook's" opinion of this, and also that of P. and M. riders, as to whether they *ever* find steering difficult.

JANEY.

Bagshot.

ENGINE DESIGN.

Sir,—May I be permitted to endorse the opinions of your contributor "Entente" on the subject of the inside or outside flywheel?

The smooth running of outside flywheel engines of the type exemplified by the A.B.C., Brough, Douglas, and Forestì is well-known, but I am inclined to think that it is more due to the nearly perfect mechanical balance of the reciprocating parts and their disposition relatively to one another than to the disposition of the flywheel.

When a piston is placed under firing stress a transverse couple is set up between its crank and the counterbalance weight of the flywheel. (Naturally, the greater the number of cylinders the less the bad effect of this couple upon the running of the engine.) Now the greater the distance between the flywheel and the crank in question the more detrimental will the couple be to perfect running. This, I think, is one of the greatest disadvantages of the outside flywheel engine.

Having regard to this, the best balance should be obtained in an engine where the cylinders are opposed, the cranks at 180°, the flywheel inside, and as near as practicable to the cranks, with a bearing on the side of the flywheel opposite to the cranks. This reduces the arm of the couple and makes for great rigidity of the crankshaft unit.

I do not know if any such design exists, but it would be interesting to know if any of the horizontal twin manufacturers have experimented with such a construction.

S. LATOUR HORDLE.

HONOUR TO WHOM HONOUR.

Sir,—The letters from correspondents appearing from week to week in the motor cyclist's "Best" give one the impression that far too many firms are only out to rake in the cash, and have no intention of giving efficient service.

Now and again someone strikes a first-rate firm, and I feel bound to place on record in your widely read and valuable journal that I have been fortunate in finding such a firm in Messrs. Alldays and Onions, Ltd. In short, my experience of this veteran firm is that its attention to customers is beyond reproach; also that its staff of experts are masters of their work, and the nett result, as far as I am concerned, is that it will not be necessary for me to think a moment where to go—it will be just "Alldays" first, last, and all the time.

I must add the usual disclaimer, as I only render to Cæsar, etc.

HB 659.

Aberdare.

COURTESY OF THE ROAD.

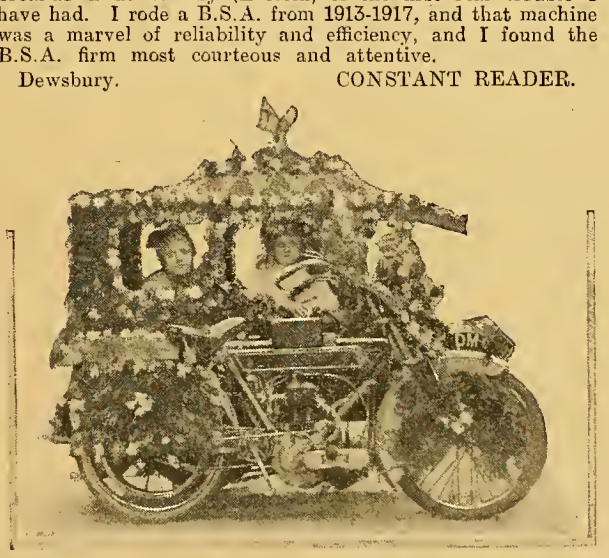
Sir,—I have seen by your correspondence columns that some appear to think that the freemasonry of the road is dying, but I had an experience on July 19th, ten miles outside Lincoln, which shows it is not yet dead by any means.

My Enfield gear became locked and wedged absolutely tightly owing to free wheel lock nut working loose and jamming the whole gear solid. I spent two hours trying to loosen the lock nut on gear spindle, but owing to lack of a hammer without any success. It was fortunate for me, however, that a motor cyclist, on an 8 h.p. Zenith, came on the scene. Although he was an entire stranger he undertook the job and told me to sit down and rest. He took the whole gear to pieces, taking no end of trouble to see that everything was in perfect condition before replacing. After three hours' hard work everything was ready, but he was not yet satisfied; he must accompany me ten or fifteen miles to satisfy himself that the thing did not jam again. However, it did not, so he left me after obstinately refusing to be recompensed in any way for his time and trouble. I need scarcely add that I shall be a long time in forgetting him.

I have been a motor cyclist for six years now, and that breakdown at Saxilby (Lincoln) is the first real trouble I have had. I rode a B.S.A. from 1913-1917, and that machine was a marvel of reliability and efficiency, and I found the B.S.A. firm most courteous and attentive.

Dewsbury.

CONSTANT READER.



Another beautifully decorated sidecar. This outfit, owned by Mr. A. Smith, took part in a carnival at Wolverhampton.

PRICES AND PRINCIPLE.

Sir,—I read with interest the letter by "Buyer," also the reply by the A.B.C. people.

I put an A.B.C. on order in January, risking a pig in a poke, on the strength of the "approximate" price of £70. At the fixing of the figure of £85, I wrote the S.A. Co. suggesting that those who were sporty enough to risk buying before seeing should have the machine at £70 or £75—a good approximate—and the "wait and see" buyers should pay the advance. They, however, could not agree.

When I saw for a few weeks the price of £85 deleted from the advertisement, I thought it looked ominous, and decided at once to cancel if any increase were made. In any case, if, as "Buyer" says—and it was not contradicted by Mr. Fenn—it will be three months before any deliveries are made, I am not wanting a tour fixing up for Christmas, and will declare off, and wait the advent of the £10 Ford, plus tariff charges.

WM. TURNER.

BENZOLE AND THE SCOTT.

Sir,—As an enthusiastic Scott rider and a strong believer in benzole, perhaps you will allow me to differ with your reader quoted in "Current Chat," who states that benzole dissolves the rubber rings on the Scott cylinder joints.

Both before and since the war I have used practically nothing but neat benzole, and never had any trouble on this point. During the war, however, the Scott people supplied rubber washers which used to dissolve after about 300 miles running on petrol, or what passed for petrol. On remonstrating, the firm expressed their regret, said they knew they were not suitable, but they were all that they could obtain in those difficult times.

Since then they have supplied me with a new type of black rubber washer, which appears to be as good when I decarbonised after 1,000 miles on neat benzole as when I put them on.

I am convinced your correspondent has got hold of some of the war-time substituted washers, and if he gets the new washers from the Scott Co. this trouble will disappear.

I used to have some trouble with benzole sooting up the transfer port gauzes, but as it has not done so latterly I think it was some temporary defect in carburation.

ERNEST CREIGHTON.

COST OF RUNNING A TWO-STROKE MOTOR CYCLE.

Sir,—Having been a constant reader of your valuable paper for the last six years, I thought you might be interested in my experiences with a Junior Triumph. I purchased it new from the makers in September, 1915, for £42, and have ridden it solely by myself for twelve months, ending September, 1916. I sold it in May, 1917, for £33, so the depreciation shows £9; this seems fairly great, but you will see I kept the machine the last six months without using it.

Mr. Bertram Westall on his Junior Triumph.

I have kept a very accurate account of all expenses, and the running costs were as follows:

Front lamp	£1	16	0
Rear lamp		12	6
Horn		9	0
Petrol 43½ gallons	5	1	1
Paraffin 2 gallons		2	6
Oil 3¾ gallons		11	3
Sundries		12	3
Chain and belt		13	2
Registration		5	0
Driving licence		5	0
Revenue	1	0	0
Insurance	2	0	0
Depreciation	9	0	0
Total	£22	8	7

Total mileage covered, 4,942 miles.

This works out at 1.09d. per mile. Now I have seen many riders' experiences from time to time in your paper, but find them vary very much. If I had done a greater mileage, it would have reduced the cost per mile, but, for the average rider, 5,000 miles will be as much as he will care to do for pleasure only.

I will now give you a brief explanation of the running of the machine. I think the Junior Triumph the finest two-stroke on the road. It climbs hills with the greatest ease on top gear, and I have not found a hill it will not take on bottom gear—8¾ to 1. Most of my riding has been done in Derbyshire and North Wales, so you will see I have not been in flat rural districts. The machine will average 25 m.p.h. on good roads. I have not the slightest hesitation in recommending the Junior Triumph to any reader of *The Motor Cycle* who contemplates the purchase of a two-stroke.

BERTRAM WESTALL.

PILLION RIDING.

Sir,—As a waiting customer for delivery of a motor cycle, I have read with keen interest your paper and all the expressions concerning pillion riding, particularly as I am a keen front rider of a tandem cycle. Naturally I have no actual experience of the addition of a "passenger" on the balance of a motor cycle, but I have much experience in tandeming, and I have been wondering wherein is the difference—allowing for minor differences of set of handlebars and saddle position, of course. All cyclists know the comparative safety of the tandem and its steadiness when riders are accustomed to it; also given similar speeds (and down some hills I can ride at between 30 and 40 m.p.h. between milestones checked by cyclometer and timed), there seems to me to be little difference. Can any of your readers give experience as tandemists and pillion drivers?

Again I wonder—in my ignorance, perhaps—what the difference may be between a pillion passenger and some of the heaped-up and heavy luggage one sees on the carriers of some machines (at holiday times, etc.) Of course, the falling off of luggage is no loss of life, but surely it does not fall off with any frequency or else riders would not carry it, and it cannot inconvenience them much apparently.

I trust that some reader can give information on this also, as probably there are many prospective new-comers to motor cycling who would be glad to use the experience without getting the nasty knocks having it first hand would entail.

JOHN TREWAVAS, JUN.

Useful Books and Maps for Motor Cyclists.

	Price net.	By post
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case	4/6	4/10
"HINTS & TIPS FOR MOTOR CYCLISTS." Full of useful "wrinkles" and little items of sound advice on the management, repair, equipment, and general care of a motor cycle. It will be found invaluable to all those who are thinking of overhauling their machines. *Sixth edition (2nd reprint)*	2/-	2/3

Obtainable by post (remittance with order) from
ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C.4.
or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

When is Ignition Advanced?

I have a 1915 3½ h.p. twin-cylinder T.T. Indian, and I shall be greatly obliged if you will answer the following questions: (1.) How to time the ignition to obtain best results. (2.) How can I tell whether the spark is advanced or retarded? (3.) Is it advisable to send a carburetter for overhaul, or obtain a new one?—W.I.P.

(1.) Time ignition thus: Fully retard the magneto control, revolve engine until piston is at the top of the firing stroke, and connect up the magneto with the contact breaker points just separated. (2.) In ascertaining which is the advanced position, remove the contact breaker cover, notice the direction in which the armature revolves, then operate the control until the segments move as far as possible in the opposite direction. This will be the fully advanced position. (3.) If the carburetter is not seriously deranged your local repairer should be capable of tuning it up for you

Knocking.

(1.) My machine is fitted with a B. and B. carburetter. At the base of the jet chamber is a small lever which can be rotated in either direction. What effect has this? (2.) When travelling at about 17 m.p.h. my engine runs well, but on opening up the throttle it develops a loud knocking, which cannot be cured by either reducing the air or retarding the spark. What might cause this? (3.) Should the crank case be periodically drained of oil, and, if so, how often? There is a small cock at the bottom of the crank case, but I can get no flow from it.—B.C.S.

(1.) The B. and B. carburetter to which you refer is the 1912-13 variable jet model. On removing the float chamber, which also combines the jet platform, you will find that the small lever operates a cam-shaped piece which covers and uncovers the jet orifices. These should be fully open when the lever is in the forward and outward position. (2.) The knocking in your engine is apparently due to pre-ignition. The cylinder and piston probably need decarbonising, also you might try a sparking plug with stouter electrodes. The engine may require a little more oil. You do not state the horse-power, but if it is a 3½ h.p. single give one pumpful every eight or ten miles. (3.) The crank case should be drained of oil every 500 or 600 miles. Possibly the drain tap you speak of is stopped up, in which case it will be necessary to clear it with a piece of wire.

Removing Magneto Sprocket.

You kindly gave me your advice on my 1912 5-6 h.p. twin Rex, and the machine now runs well, but the blow-back through the carburetter is just as bad in spite of new springs and valves. I put it down to overlapping of valves in front cylinder, as both exhaust and inlet valves are slightly open at the same time. On attempting to rectify this I could not remove the magneto sprocket (Bosch), thus holding back part of chain cover. (1.) Is this sprocket a driving fit? (2.) How can I remove it? (3.) Can I rectify this overlapping of valves in the front cylinder without upsetting the back cylinder?—C.S.

(1.) The magneto sprocket is fitted on a tapered shaft. (2.) On some models of the Rex, the lock-nut may be taken out, reversed, and screwed into a recess at the end of the sprocket, when it butts against the shaft and withdraws the sprocket. If yours is not of this type, remove the lock-nut, and while pulling on the sprocket give the end of the shaft a smart blow, using a brass punch or a piece of hard wood to protect the threads. (3.) In the 1912 twin Rex, the valves are both operated off the same cam; therefore it will be impossible for you to alter the overlapping

An Early Scott.

Having an old type pump without sight-feed on my Scott, I find the oil in the tubes constantly pumping up out of the filler cap, and have to run with the automatic device cut off and use the pump as a hand feed only. I wrote to the makers, but got a reply to the effect that the trouble was inherent with this type of pump! I could not get a sight feed lubricator, so looked into the cause. It is this. Instead of the oil hole in crank case registering with the pump when the maximum suction occurs in the engine crank case, it registers when the piston is almost at the bottom! Is it possible for me to shift the outer main roller race round to the correct position? I had the crankshaft out once, but did not touch this ring. How can it have shifted round? Both crank cases are alike.—S.A.R.

As the Scott Co. inform you that the trouble is common with the type of oil pump fitted to your machine, we scarcely think you will be able to effect a complete cure. The main roller race is pressed into the crank case, and we scarcely think it advisable for you to attempt to move the position of this. We suggest experimenting with petroil lubrication as an alternative.

MOTOR CYCLE TESTERS.
The competition men in embryo. An every-day scene at the Triumph Works

Overheated Two-stroke.

I should be very much obliged to you if you could explain why: (1.) The crank case of my 2¼ h.p. Radco gets very hot, so hot, in fact, that the timing chain, which was heavily oiled, became absolutely dry and fast when the engine cooled after a thirty-mile run. (2.) What amount of oil should there be in the crank case? I use one measure of oil to half a gallon of petrol. (3.) The petrol consumption is very heavy, about 34 m.p.g.—R.B.

(1.) Probably the piston rings of your engine are carboned in their grooves. As they will most probably break when removing them, it will be necessary to fit new ones. No doubt this is the cause of your engine running so hot. (2.) You require one part of oil to sixteen of petrol. (3.) The heavy petrol consumption is no doubt due to the engine being out of tune. Overhaul the petrol system for leaking joints, also reduce the level if necessary.

Speed Timing.

Owing to the makers having ignored my query, may I ask you for information *re* the valve timing of my 3½ h.p. horizontal opposed o.h.v. twin? What is the best timing for speed work? I had occasion to take the engine down, and the timing wheels are not marked.—H.F.

We suggest the following timings for your engine—the more suitable of the two will need to be found by experiment or by examination of the dwell of your cams. *Normal Setting.*—Inlet opens 10° after top dead centre; inlet closes 20° after bottom dead centre. Exhaust opens 40° before bottom dead centre; exhaust closes 10° after top dead centre. *Speed Setting.*—Inlet opens 10° before top dead centre; inlet closes 10° after bottom dead centre. Exhaust opens 55° before bottom dead centre; exhaust closes on top dead centre. *Ignition.*—Fully advanced 9 mm. before top dead centre.

Standard and T.T. Models.

I should be glad if you would answer the following: (1.) Is there any difference in the engine of the New Imperial 2¾ h.p. motor cycle and the T.T. model of the same make? (2.) What is the speed of the T.T. model? (3.) What is the capacity of oil and petrol in the tank? (4.) Will this bicycle take a light sidecar? (5.) Do you really recommend this machine for touring?—G.W.L.

(1.) There is probably very little difference in the engines fitted to the New Imperial standard and T.T. models, but the latter no doubt receives special attention as regards tune. (2.) The maximum speed on the road should be somewhere in the region of 45 m.p.h. (3.) The capacity of the tank is about one and a half gallons petrol and one quart oil. (4.) This machine would take a light sidecar, but we do not recommend these small machines for serious sidecar work, as it is altogether unfair to the engine to expect it to undertake work for which it was never designed. (5.) For solo touring you would find this machine quite satisfactory.

The Sturmey Gear Box.

I have a 1919 Model H Triumph, two weeks old, which I have ridden 800 miles solo. (1.) With the middle gear in position there is at least 1in. play between the belt pulley and the chain sprocket on the gear box before the drive is taken up. This is sometimes felt when running on the road slowly on top. There is about ½in. play on top and bottom gears. (2.) Is the following method of descending long hills in any way detrimental to the transmission? Declutch and slip into neutral. Run down hill in neutral, and at the bottom, before the machine has come to rest, restart with the kick-starter, and bring the gear lever into the middle or top according to speed? (3.) Recently, after a run of about seventy miles, with a total of about 800, when coasting down hill in this manner a most distressing intermittent grinding and scraping noise proceeded from the gear box. I stopped and ran the engine on the stand for a few seconds with the gear lever in neutral and the scraping noise was still in evidence. I put about three pumpfuls of oil in the gear box with the squirt, though it seemed to be well lubricated. What was the cause of this noise? (4.) How often should the Triumph gear box be lubricated? If the oil runs through to the clutch and causes slipping, as, I understand, often happens, should the clutch be taken down and the plates dried? (5.) Can the clutch be slipped pretty considerably without harm?—E.L.S.M.

(1.) The play, or backlash, in your gear box certainly appears slightly more than normal, but we cannot think that there is anything to worry about, as the design of the gear wheels necessitates a fairly large amount of play. (2.) Your method of descending hills is not to be recommended, since it is easily possible for the gears to jump into engagement. (3.) Possibly this happened (see No. 2). (4.) Lubricate the gear box every 500 miles. Should oil reach the clutch plates it may be necessary to clean them, but this trouble will not occur if the gear box is not over-lubricated. (5.) The clutch may be used freely in traffic or for descending hills.

READERS' REPLIES.

Petroil on Scotts.

Further to the letter by Mr. Chas. Harby in the issue of August 7th, we should like to say that we have known many riders who use the petroil system with success; but we think that Mr. Harby's quantity of oil is excessive. The proportions giving the best results vary slightly on individual machines, but, as a rough guide, it will be found that half a pint of oil to two gallons of petrol (*i.e.*, one tankful) as a maximum, and quarter of a pint to two gallons as a minimum, will be ample.—THE SCOTT MOTOR CYCLE CO., LTD.; N. O. Vinter, Capt., Sales Manager.

Magneto Ignition.

Under the above heading, "B.S.A." is in doubt with regard to the apparently conflicting advice given to Mr. H. E. Porter to remove the glaze from the carbon brush on an N.S.U. low-tension magneto, and that of Mr. A. P. Young, who says that the glaze on a carbon brush does *not* affect the working of a magneto. As a matter of fact, both are correct as regards the machines to which they allude. The magneto of an N.S.U. is really a low voltage dynamo, supplying current to a coil—taking the place of an accumulator, in fact. The voltage is probably not more than 4 or 5 volts, and the glaze (which more often than not is composed of oil or grease and dirt) is practically a non-conductor at this pressure, and will not allow the current to pass through it. It is quite conceivable that either a glazed brush or a dirty commutator will prevent such a machine from generating enough current for the coil. Mr. Young doubtless refers to the high-tension brush of an ordinary magneto, and he is, of course, correct. Here one deals with an infinitesimal amount of current and a very high voltage (nearer 4,000 than 5), and no amount of glaze would affect it; in fact, there is no need for the high-tension brush to touch the slip ring at all. When the primary circuit is broken, the resultant high-tension current will seek to complete its circuit *via* the brush, high-tension wire, and plug, and, even if the brush is not touching, it will jump to it from the slip ring, provided the distance is less than that of the safety gap. As a matter of fact, in some American ignition systems the revolving distributer is never actually in contact with the high-tension wires at all, the spark merely jumping across when the contacts are opposite each other. At the same time, of course, it *is* necessary to keep the low-tension brush of a magneto clean, as well as the platinum points, as they are in the primary circuit, which is comparatively heavy in current and low in voltage.—CLEVEDONIAN.

EXPERIENCES WANTED.

Can anyone give me his experiences of the F.R.S. magneto lighting set as fitted to a Douglas (or other twin machine), as regards (1) quality of light given at fast and slow speeds; (2) effects, detrimental or otherwise, on sparking at slow speeds, and on the magneto?—W.H.S.

RECOMMENDED ROUTES.

LEICESTER TO LLANDUDNO.—H.P.

Leicester, Hinckley, Atherstone, Fazeley, Brownhills, Wellington, Shrewsbury, Oswestry, Llangollen, Corwen, Pentre Voelas, Llanrwst, Llandudno. Approximately 240 miles.

COVENTRY TO SWANAGE.—L.J.

Coventry, Kenilworth, Warwick, Wellesbourne, Ettington, Halford, Moreton-in-the-Marsh, Stow-on-the-Wold, Bourton-on-the-Water, Cirencester, Malmesbury, Chippenham, Melksham, Westbury, Warminster, Shaftesbury, Blandford, Wareham, Swanage.

BOSCOMBE TO PRESTON.—S.L.S.

Boscombe, Blandford, Shaftesbury, Bath, Stroud, Gloucester, Worcester, Kidderminster, Bridgnorth, Whitchurch, Warrington, Wigan, Preston. Approximately 270 miles.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words or less 2/-, and 2d. for every additional word. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, or London (20, Tudor St., E.C.4), by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the car offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

ARIEL, 2¾h.p. Bosch mag., running order; £20, or near offer.—Flint's Garage, Grays. [1184

CROW Bros., High St., Guildford.—Ariel agents since 1913. 1919 deliveries have begun. [5299

EASTERN GARAGE

ON PRICES.

In pre-war times certain unscrupulous dealers, having no business qualities to commend them to the prospective purchaser of a motor cycle, resorted to the short-sighted policy of secretly cutting prices. In this way they obtained orders from misguided clients who overlooked the fact that "first cost" is not the most important factor for consideration when purchasing a motor cycle.

To-day, when the demand for machines so much exceeds the number available, those same dealers are practising the equally iniquitous and suicidal policy of asking prices quite absurd for almost useless crocks, and by demanding enormous premiums for the new machines they are able to obtain from the manufacturers.

Both these practices are a distinct breach of faith with the manufacturers, and both operate to the disadvantage of the retail purchaser in different ways.

When an Agent enters into a contract with a manufacturer for the supply of motor cycles, one of the most important clauses of the agreement he signs is his undertaking to re-sell the manufacturer's goods only at fixed list prices. In departing from this either by charging less or more than list price, an Agent is guilty of breaking a solemn compact with the manufacturer, and in so doing proclaims himself unworthy of the confidence of the motoring public.

Throughout the whole of the twelve years The Eastern Garage Company have been established it has been their inflexible rule to adhere strictly to list prices, and, whilst in pre-war days they relied upon "service to customers" and not price cutting to secure business, they are now equally determined to maintain minimum list prices, and are able to state that not a single new motor cycle has been sold by them at anything but fixed retail price.

Under no circumstances will The Eastern Garage Company depart from this policy regarding prices, and they are equally determined to adhere to their rule of delivering machines to customers strictly in the rotation in which their orders are placed.

If you require a new motor cycle, send your inquiry to us. We are Agents for all the desirable makes, and you can depend upon receiving scrupulously fair treatment, both in price and delivery.

The joys of motor cycling are manifold—but they are always associated with freedom from mechanical trouble. From the grateful manner in which hundreds have written thanking us for the thorough way we have repaired their

Sturmey-Archer
or
Armstrong Gear

We are justly conscious that we have done our part well.

RECOMMENDED BY THE STURMEY-ARCHER Co

We regret, however, through **heavy pressure on our works at the present time, we cannot undertake repairs at short notice, but you can rest assured that orders will be executed as promptly as possible, while we are now in a position to undertake the immediate repair of Sturmey-Archer 'J.S.' Hubs.**

BOOT

REPAIRING

"Elite Holdtite Riveiless Soles."

Soles STUCK ON.—

We are now placing on the market an entirely new and Patented Rubber Sole. These soles are specially prepared with an adhesive surface, and fixed with Elite Holdtite Sol-fix solution. **We guarantee them to hold as firm as rivets or sewing.** This process of fixing is exactly the same as that of repairing a punctured Motor or Motor Cycle tube. One of the many great advantages of our process is that the Boots or Shoes when fitted with our soles become **absolutely waterproof.** Full instructions given with each pair of soles

The "IVY" TWO STROKE

The Victorious Ivy

was introduced in

1908

was practically unbeaten in open competition for the three years

1911

1912

1913

winning over 200 medals, 5 cups, and 2 A.C.U. Certificates, **3rd in Junior T.T. (1913)**, and 1st Single Cylinder Home. In

1914

still victorious. Smallest two-stroke to survive T.T. Course, averaging over 30 m.p.h. "Motor Cycling" said, "The Best Performance of the two-strokes in Junior T.T." In

1915

competition suspended. The machines on the road winning golden opinions everywhere. And in

1916

1917

1918

our factory was solely devoted to war work. In

1919

manufacture resumed, unanimously voted the best two-stroke on the market.

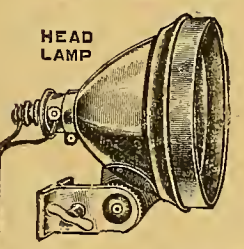
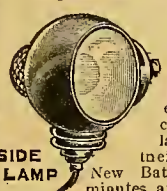
"Volex"



DRY BATTERY Lighting Sets.

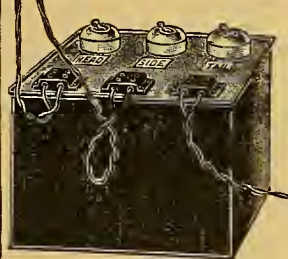
BRITISH MADE.

Volex Lighting Sets are the ideal, no-trouble outfits for the Motor Cycle and Sidecar.
For over ten years they have been in use for this service, and of recent years, in consequence of their dependency, the demand is constantly increasing.
Dynamo Lighting Sets with Accumulators require careful attention and owing to complications have a tendency to go out of order. Accumulators if not regularly charged, whether in use or not, sulphate and become useless.



VOLEX DRY BATTERY LIGHTING SETS give no trouble whatever. The Battery, which is fitted in a metal container with switchboard mounted on top, lies conveniently in the bottom of the sidecar and with ordinary care will last, when in use, from six months to eighteen months without renewal. New Battery can be fitted in a few minutes at but little cost. The Battery case contains three separate Volex 4-volt Aero Dry Cells, with separate connecting boxes for the cables to Head, Side and Rear Lamps. If one of the batteries becomes exhausted it can be replaced independently of the others. Unless specified, we always provide 4 volt Metal Filament Bulbs to each lamp, but 8 volt Bulb for Head Lamp will be provided where desired.
Complete outfit (as illustration), including Head Lamp, Ball Pattern Side and Tail Lamps, 3 Volex Aero Dry Batteries in metal container with switchboard, Metal Filament Bulbs, and Waterproof Conducting Cords. - - Price £6/10.
Spare "Volex" Aero Batteries 15/-.

CAUTION.—We would warn users that they may be offered substitutes for the "Volex" Dry Battery. No other battery will approach in reliability, durability, or capacity the British Made "Volex"



List M. 200, Motor Cycle Lighting, free on request.

BATTERIES IN CASES, complete with waterproof conducting cords to work in conjunction with own lamps.

The Rights of the Irate Pedestrian.

IN our last issue we referred to some extraordinary evidence which came to light in the hearing of a case at the Southend Police Court, where a young motor cyclist was charged with driving to the common danger.

Unfortunately, the affair was somewhat prejudiced by the fact that he was unable to produce his licence when stopped by a constable, and also had another charge against him in respect of driving without lights.

On the main charge, however, the evidence was conflicting. The chief witness, at whose instigation the proceedings were taken, alleged that the defendant's speed was from "40 m.p.h. to 45 m.p.h., and, in my own mind, more"—such a statement should discredit any evidence—but other witnesses called stated, and we learn also from a person present who saw the proceedings, that the motor cyclist was doing from 10 m.p.h. to 12 m.p.h.

The point we wish to raise, however, has regard to the actions of this particularly malignant witness. Feeling aggrieved by the manner in which the defendant was riding up and down the road, he, according to his own evidence, endeavoured to hook him off the machine, and, not being successful, on a subsequent evening again went to the same spot with the intention of waylaying the offender, and stopping him. Again failing in his utterly unlawful project, he reported the matter to the police: a thing which he would have been perfectly justified in doing in the first case if he considered he had a proper cause for complaint; but surely by no means excusable following on, and no doubt in pique through the failure of an assault.

We commend this case to the notice of the various organisations which protect the interests of the private motorist, for, despite the fact that the pedestrian's conduct was such that, had he achieved his object, he might easily have brought about circumstances which would have resulted in his own trial on a charge of manslaughter, not one word of censure or reproof was addressed to him by the Bench.

Motorists as a body have every right to demand some explanation of this omission, otherwise a precedent appears to be established whereby anyone, believing himself to be aggrieved, may deliberately waylay the supposed offender and assault him with *malice prepense*.

Imported Motor Cycles.

AT the present moment a tariff of 33⅓% is payable upon all motor cycles imported into this country, and until September 1st next imports are restricted. After that date the restrictions are to be removed, but Mr. Lloyd George's speech and subsequent amplifying statement did not make it perfectly clear whether the tariff duty was to be retained or not. In the case of "Unstable Key Industries," of which the most important, from the motor cyclist's point of view, is the manufacture of magnetos, it is clearly stated that a licence fee will be charged which will be fixed "with regard in each case to the difference between the price at which the article can be imported and the price at which similar articles can be sold in the United Kingdom." It may be necessary for the Government to assist these "key industries" for some years, but care will be taken that no undue profits are made at the expense of the community.

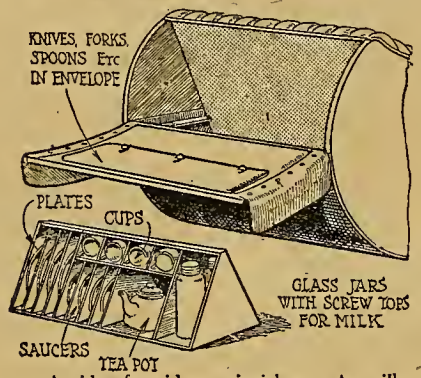
Enquiry at the Home Office has elicited the information that the 33⅓% import duty has still to be paid on American motor cycles. This duty was imposed during the war, primarily to aid British manufacture and as a spur to the nation generally in production. But, rather than acting as a spur, it has had a neutralising effect, or no effect at all, on the workers, for production, as everyone knows, has lessened to an alarming degree. Originally, it was proposed to lift the 33⅓% embargo in September, 1920, the date afterwards being altered to May.

An Index to the advertisements in this issue will be found on the page facing the back cover.

IDEAS: Useful and Ingenious.

A Sidecar Pantry.

A NORTH of England reader sends particulars of the picnic pantry on his sidecar. It will be seen that the rear locker of the type of sidecar illustrated may readily be converted to meet the requirements of the family party who wisely take their meals in the open. The lid of the locker is provided with a dust-proof envelope, in which knives, forks, spoons, etc., are carried, and a "lift-out" rack accommodates cups, saucers, plates, and teapot. The lower part of the locker is utilised to carry water cans and tins for foodstuffs.



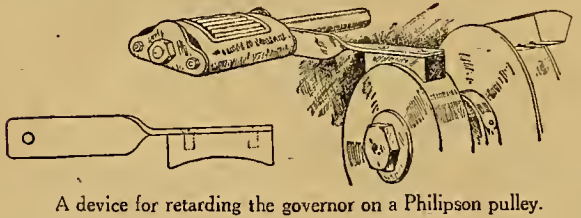
An idea for sidecar picnickers. As will be seen from the illustration, the equipment is carried in the rear portion of the sidecar.

A Philipson Pulley Control Brake.

THE Philipson governor pulley on many machines may be very simply fitted with a small foot control brake, which can either be operated with the heel, resting the toe on the footrest, or with the toe only.

The sketches are practically self-explanatory, the brake consisting of a short length of flat steel twisted through a right angle for half its length, one end being drilled with a ¼in. hole to accommodate the specially long bolt which replaces the standard footrest-rubber bolt. The other end of the steel has two ¼in. countersunk holes to receive the Whitworth screws which secure the fibre pad.

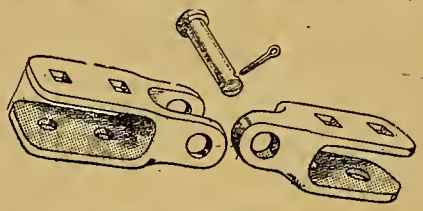
Red fibre is used for the shoe, as it is found to have the minimum braking effect on the engine and yet retards the governor of the pulley sufficiently, and the fitting may be just light enough on the footrest to stay up if not required, or it may rest lightly on the pulley.—H. BRUNSDEN.



A device for retarding the governor on a Philipson pulley.

An Improved Belt.

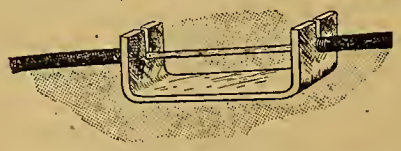
IN order to obtain belt fasteners suitable for use on his privately constructed 8 h.p. cycle car, Mr. Duncan, a Smethwick dental surgeon, made two fasteners from solid steel. The design of these is depicted below, and may appeal to other motor cyclists who require exceptionally strong belt fasteners to be used in conjunction with large pulleys.



A belt fastener made from the solid by Mr A. J. Duncan for use on his cycle car.

A Bowden Wire Repair.

THE value of this tip is possibly limited in the case of home-country riders, who are never very far distant from garages and repair men, but coming from an overseas correspondent, it casts an interesting side-light on the manner in which quite simple replacements may necessitate the use of some makeshift until a proper renewal can be made.



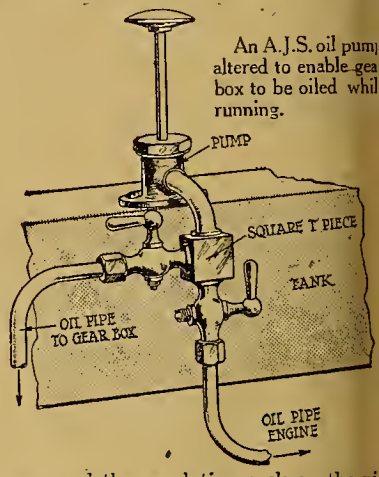
An improvised Bowden wire casing repair

When a Bowden casing is damaged by being squeezed, the inner wire generally sticks, but a temporary repair can be made by unwinding the outer coil for an inch or two, cutting out this part and replacing it with a piece of strip iron, bent and slotted at the ends as shown in the sketch; finally pinching the saw cuts together.—G.W.N.

Gear Box Lubrication.

IN order to provide a simple and ea method of maintaining a corre supply of lubricant in the gear b of an A.J.S. the apparatus here illu trated was devised.

A brass T piece was first obtained a fitted between the elbow piece on the



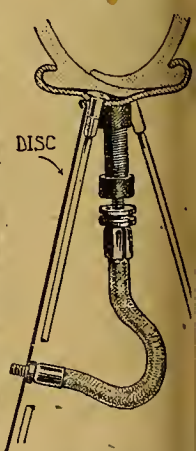
An A.J.S. oil pum altered to enable gea box to be oiled whil running.

pump and the regulating cock on the pi to the engine and a tap was fixed i this and a copper pipe led therefr underneath the tank and down the sad tube of the frame to the gear box.

By closing one tap and opening t other a charge of oil may be passed either engine or gears as desired.—. REILLY (Lt. R.A.F.)

Tyre Valve Adapter for Disc Wheels.

AN adapter which can easily be fitted to the tyre valves of motor cycles with disc wheels consists of an ordinary cycle inflator connection, one end of which is screwed to the valve and the other let into the disc, with the dust cap on the outside. This allows for inflating the tyre without moving the sliding inspection hole covers. (The usual chain attached to the dust cap can be soldered on to the disc.)—J. MUNCASTER.



A permanent inflato connection for dis wheels.

Occasional Comments

"Ixion"

Catering for the Duffer.

the Rapson unpuncturable tyre proves to be all that is claimed for it, the last obstacle in the path of motor cycling for the million is removed. —I do not say "motor cycling for the ,000,000," which would imply an insurmountable obstacle. Mechanical reliability has already hed a high standard, if the ideal is still distant; the certainty of punctures with existing types of s has deterred the nervous from buying motor cycles. en a puncture-proof tyre, the men and women who he tinkering will be emboldened to buy. It follows controls will have to be simplified very consider-. Take gears as an example. I am now riding achine adorned with a gear box which is quite one he best I could have. It is possible to make an olutely shockless change with this box; but it is possible by a feat of legerdemain. If I manipu- the handle-bar valve lifter and clutch lever whilst nging gear, the gears go in as a knife enters butter. both the aforesaid levers are situated on the left- d grip, I usually change gear on the valve lifter ne, in which case the machine gives a convulsive , exactly as if a spring frame were passing over a boulder or pot-hole. I have taught several athletic ngsters to ride on this machine. It is instructive ride behind them when they have reached the stage which they can be trusted out on main roads. *They ays wobble when they change gear.* I have also d to teach one or two elderly men and several girls ride this same machine. Such persons dare not nge its gears until they have undisputed possession a nice, wide, straight piece of road. I might write a similar vein about the carburetter, the levers of ich require lightning and knowledgeable manipula- n when starting up, or rounding a sharp turn; or ut the ignition, which, in conjunction with an urdly high compression ratio, wants quite a lot of mouring.

Cinquevalli Outclassed.

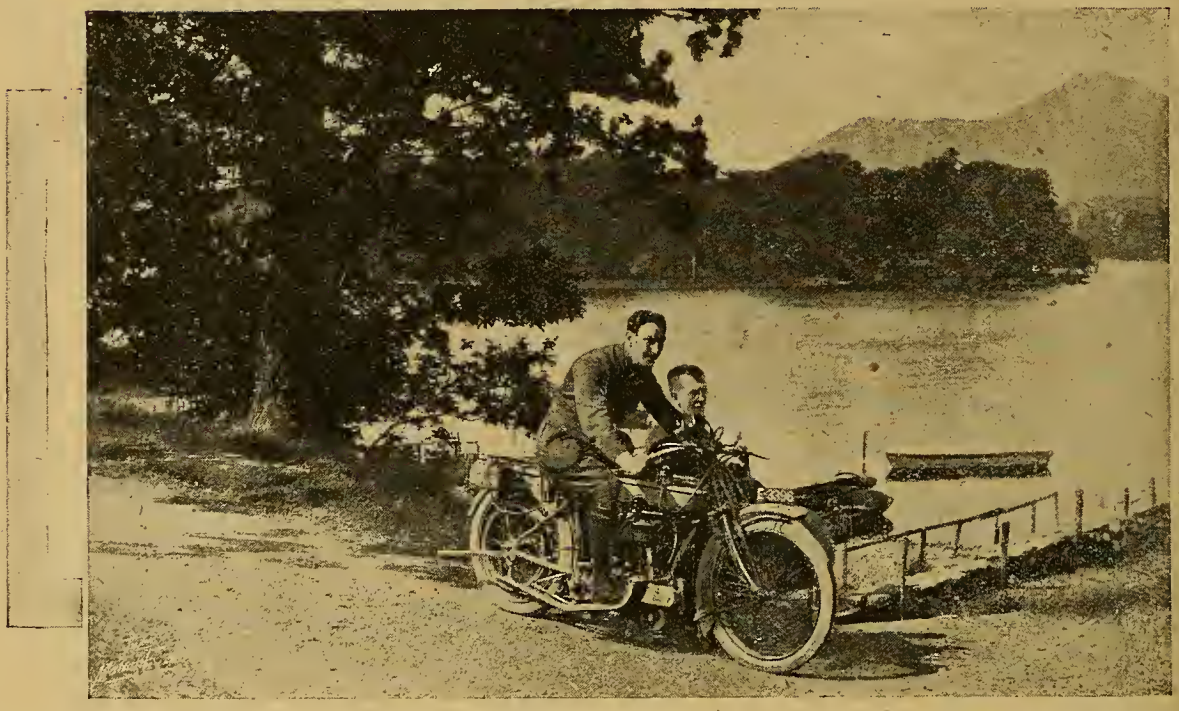
N fine, I do not think the trade realises what demands the conventional machines make on the attention of unskilled riders. They are actually tinctly more alarming to a novice than any car and uire far more handling. In the forefront stands obvious fact that the learner has to balance the chine, whilst he performs actions as complex as y car can call for. If he concentrates too exclusively getting a perfect mixture or letting in the clutch ntly or finding the right notch in the gate, the front eel begins to wobble most fearsomely; and, as his scles have yet to master the instinctive correction steering errors, he is correspondingly perturbed. the second place he must face all the early terrors ne, whereas, in learning to drive a car, he has a mpanion who undertakes general responsibility, and ows the pupil to concentrate on one point at a time— ering, clutch work, throttle work, brakes, or gear-changing—but never all together. Thirdly, the car driver is always provided with an automatic carburetter and a simple control for it. The motor cycling novice has usually to wrestle with a two-lever carburetter, which is often extremely sensitive, and a bad blunder confronts him with the task which he probably dreads above all others—that of restarting the engine. Fourthly, he must on no account forget to oil the engine, whereas a car engine oils itself. Reviewing these points of contrast, one is not surprising that motor cyclists continue to be drawn almost exclusively from the ranks of youth and sportsmanship. But, given unpuncturable tyres and a simplified control system, there is no reason why millions of duffers should not share our pleasures and conveniences. If the trade would only see it, the scooter craze is a very strong pointer in this direction. Its popularity is partly accounted for by its low weight and cheapness; but, nevertheless, its supposed simplicity is a large element in the craze, for the buying public have yet to learn that simplicity obtained by means of a single gear and a tiny engine is not necessarily preferable to sundry complications.

Our Smooth Chain Drives.

AS I often grumble, I am bound to raise my hat to the trade when I find they have genuinely floored an awkward antagonist. The drawbacks of belt drive, like the quality of Government ale, have always been obvious. When a few daring makers began to coquet with the all-chain drive, especially upon single-cylinder machines, I felt dubious. For years we had been accustomed to ride in sublime oblivion of our transmission for perhaps 75% of our mileage. When we changed over to the chain, we certainly bade farewell to such heart-breaking interludes as broken fasteners or chronic belt-slip implied. On the other hand, the snatchy drive of the early chains made us perennially conscious of our transmission, as thudding vibrations had always made us conscious of single-cylinder engines. Only with the engine running fairly fast on a low gear ratio under light load was the early chain drive at all comparable to the belt. This week I have been driving a high-compression single-cylinder mount with all-chain drive. I say deliberately that its drive is as smooth as the best belt, well run in and perfectly adjusted. Even if I make the engine baulk and conk on the pick-up, after a fierce corner or on the foothills, I remain unconscious of the fact that I have a rigid drive beneath me. This is very real progress. I do not say that all chain systems are as good as the one I own; but I do say that it is at least possible for a machine fitted with the roughest type of engine to be chain-driven and yet to feel as if it were belt-driven. I must now eat my own words of long ago, and admit that the function of the belt is just about fulfilled. Spring drives and cush hubs are reaching a miraculous efficiency.

Low-powered Sidecar Touring.

A 3½ h.p. Norton Outfit on Lakeland Hills.



A pretty peep by the shore of Derwentwater. The sidecar is a 3½ h.p. Norton, on which a Lakeland tour was successfully undertaken

THE outstanding feature of a record motor holiday crowd in Lakeland has been the number of comparatively low-powered sidecar outfits on the road. One refers here to those with engines in the vicinity of 3½ h.p. Of course, the bigger powers are better for real hill work, but there has been plenty of evidence that these machines can get about successfully amongst the hills and dales of the Lake District.

In this connection the writer had an interesting talk with Lt. I. G. Bethwaite, a north-country sportsman and competition rider. His usual mount, the big Harley-Davidson, is familiar in the North, but as an expert tuner he is more enthusiastic about the efficiency of the 3½ h.p. type. Lt. Bethwaite achieved distinction in the war, first as a despatch rider and latterly in the Air Force as a fighting pilot. On thr occasions he was brought down "badly holed" twice his petrol tank and once himself. Along wi Lt. C. R. White he has been recovering amongst t Lakeland mountains, and the performances of th 3½ h.p. Norton have been worthy of note.

Climbing Castlerigg, a hill leading from the Vale of Derwentwater on the road to Windermere.

The remarkab petrol consumpti of ninety-five mi to the gallon the Norton achieved throu careful valve ti ing and carburet adjustment. Th exhaust val spring is slight stronger than t inlet. Few ride realise that we takes place on t variable taper needle for the of the B. and carburetter, a r this causes faul running. A n needle is easi fitted, and th should be adjust to give full cont of the air leve that is, to obta

w-powered Sidecar Touring.—

h an adjustment that when travelling on the road it ossible to bring the air lever back from fully open to point where a proper mixture is obtained. The most portant detail is to adjust the petrol level to 1/8in. ow the top of the jet—this is the secret of the arkable petrol consumption. In the engine all rings are, in Lt. Bethwaite's words, a "sloppy" but the magneto chain drive should be kept at per stretch by moving the magneto bodily forward its bed. The Sturmey-Archer three-speed gear box gives splendid results if filled up systematically with thick gear oil every 300 miles. Finally, Lt. Bethwaite believes in having everything throughout the machine thoroughly lubricated; oilers on forks, steering head, and wheels are not put on as makers' ornaments. The keen ear for the note of the engine, whether of the small land type or swift air-fighting type, is a gift of inestimable value, but the few practical hints given above may, during the coming days of peaceful motoring, help those who wish to obtain the utmost horse-power out of the moderate-powered sidecar outfit.

Motor Cycle Mountaineering.

Climbing a Mountain Two Miles High on a Harley-Davidson Flat-twin.

THE mountain popularly known to our erican *confrères* 'Old Baldy" (Mt. n Antonio) has re- tly been climbed Jack Fletcher, unted on a Har- -Davidson sport- model of the e described on ge 181 (issue dated gust 14th). This model, in country of its gin, is referred to the "little" chine, but as its pacity is 584 c.c. certainly cannot nsider it to be in lightweight class; at the same time its performance climbing a mountain two miles high speaks well its power and controllability.

At the summit of "Old Baldy." J. Fletcher on a flat-twin Harley-Davidson fitted with tractor rear wheel, which enabled him to achieve the first ascent by motor cycle of Mt. San Antonio.

A tractor rear wheel was fitted to enable the machine make progress over the loose shale and crumbling nite, and the climb was accomplished without mechanical trouble in actual riding time of 3h. 42m., *i.e.*, after deducting the time spent in waiting at various points for recovery of breath, and for the photographer and cinematographer who followed the trail on foot, driving three mules which carried their apparatus.

The first two miles passed over a well-defined track, after which follows Hard Scramble Ridge, rising 2,000ft. in one mile, and higher still on a section known as the Devil's Backbone, the trail is barely a foot wide, sloping away at both sides in a drop on to loose stones some 3,000ft. deep.

At an altitude of 8,000ft., the rarity of the atmosphere was particularly noticeable, and the engine power fell off considerably.

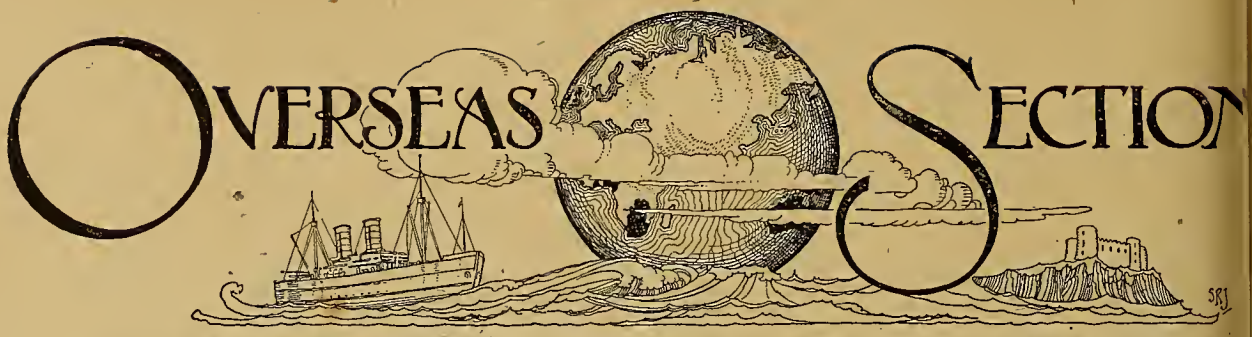
Eccentrically Bored Chain Wheels.

A Point for Consideration when adjusting Driving Chains.

A FAULT occasionally to be found in chain-driven machines is inaccurate boring of chain-sprockets. This causes the sprockets to be entric, and the chains to be alternatively tight and se, so that correct tensioning is not possible. The uble is not confined to any one particular make. tor cycles, which have recently come under our ice having this fault, include a couple of light- ghts, a single, and two twin sidecars. Obviously s a matter for works' managers seriously to investi- e. It may be found that war-worn machinery is re- nsible, and the difficulty of obtaining new plant. mention the point, as it is one that is not likely enhance the reputation of motor cycle makers as gineers, and because the demand for motor cycles at the present may tempt a production manager to "pass" faulty parts which under other conditions would be "scrapped."

Eccentric chain wheels in the hands of those who merely tighten their chains and take no measure to ascertain if the tension is more or less correct at all positions of the wheels, will also place undue strains upon engine and gear units, and worn bearings will result, besides incurring risks of chain breakages, which may bring into disfavour a system of transmission that has so much to commend if only it be properly applied.

Owners of chain-driven machines on adjusting their chains should take care to note that there are no "tight places."



A Commentary based upon Practical Experience and a Study of Overseas Opinions.

Spring Luggage Grids.

As a result of the notes which appeared in our last "Overseas Comments," urging the need for better springing of the luggage carrier on sidecars intended for colonial roads, and yet avoiding the light type of grid attached to the bodywork, several readers have suggested a rearward extension of the body side-members to form a platform, so that luggage would be insulated from shocks by the springs which support the passenger. One large firm has already perceived this advantage, Rudge-Whitworth, Ltd., having adopted this system on its sidecar, which was described on page 384 of *The Motor Cycle* dated April 17th. As will be remembered, in this design the springs carry a large rectangular frame of angle steel of sufficient size to support the body, and also to form a grid and petrol can carrier; the mudguard is also attached thereto, so that nothing likely to suffer from vibration is directly fixed to the chassis.

Lessons from Trials.

THE Scottish Six Days Reliability Trial may be taken as the Overseas trial of the British Isles, and the lessons to be deduced from it should be contemplated by all who are interested in Overseas trade. This year's Scottish event brings home one or two old, old lessons, foremost among which, perhaps, is the desirability of interchangable wheels—not only for sidecar machines, but for solo mounts also.

To quote one single instance. A competitor on the first day of the trial had the misfortune to encounter a jagged rock with his rear wheel. It cut clean through the outer cover, and punched a neat little hole in the tube. There was no time between the short checks of that day to change the cover over to the front wheel, so the competitor had to do the best he could by means of patches and a gaiter.

As onlookers, we ourselves were sure that all chances of an award of any kind for this man were gone, as he carried no spare cover, and was not, according to the rules of the trial, allowed to buy one after starting. It was distinctly hard lines, as the rider and the machine were pretty sure of pulling through had fortune favoured them, whereas it was now vastly improbable that the tyre would hold out on the rear wheel until a long blind to get ahead of time when the going was favourable made it possible to change the wheels. Later in the day the tyre gave out again, and a frenzied repair enabled the competitor to check in with about three seconds to spare.

That night he requested permission to buy a new cover, explaining his misfortune, and the sporting Scots —rather to our surprise—acceded to the reque Luck favoured the competitor again, for he found cover of the desired size at the very garage where t machines were stored, and managing next day to g ahead of time, in spite of unending trouble with t old cover, he succeeded in making the change, a finally gained a premier award.

Here, however, was a choice example of a premi award hanging in the balance owing to no defect in t machine as it stood—it was one of Britain's best and owing to no fault of the rider. Had he, at t first, been able to whip out his rear wheel, make t best repair possible, then change his wheels over, that the cut cover rode easily on the front wheel, wh anxious moments would have been spared him! T cut cover would probably have lasted out the tri with perfect safety on the front wheel, but fifty mil on the rear wheel was sufficient to aggravate the inju so that the tyre became practically useless.

Economy in Tyre Purchase.

IT is to be hoped that, ere long, machines will be fitted with interchang able wheels, for; quite apart from the co venience thus afforded, the addition mak a considerable difference to one's tyre bill. Generally rider buys the best cover procurable for the re wheel, while the front is shod with a cheaper a lighter production. Such a method is not economica and it is far better in every way to buy heavy cove for both wheels. The thin cover, if transferred to t rear wheel when the latter begins to wear somewha is seldom satisfactory. It soon proves itself not to puncture proof, and very probably the canvas go inside after quite a short mileage. Far better is it tyre both wheels alike, and then one is certain of punctures through the heavy tread of the front, a when the back cover wears down and it becomes nece sary to reverse them, one still has the front whe well shod and fit for many hundreds of miles, besid possessing puncture-resisting properties at least equ to a cheap tyre.

Strength of Construction.

BROKEN frames are usually a veritab epidemic in the Scottish Trials, but it worthy of note that only one fram breakage occurred this year, and that was due pressure of time necessitating the use of a brazed fittin instead of standard solid forging for the particul frame member which collapsed. There were, of cours several instances of broken sidecar couplings, and the will probably be just as many in every such trial t spring sidecar wheels become the rule rather than t

rseas Section.—

eption. The war has tended to stiffen up many tish designs, and though this may be desirable so as solo machines are concerned, too much stiffening sidecar design generally leads to breakage. Stiffen r motor cycle frame so that it cannot break and bably it will break your sidecar chassis; stiffen r sidecar chassis at its previously weak points and bably you create new weakness, and if the stiffening cess be carried too far, the point is reached at which sidecar chassis will break the motor cycle frame. And so we go on piling on weight *ad infinitum*, the weakness of the whole structure lies in its dity, and the only way to neutralise this condition o employ spring frames and spring sidecar wheels, whereupon the weight of the whole outfit can be cut down to a minimum.

At the same time, it must be stated that most of the sidecars competing which did not break their frames were subjected to an extremely severe test—more severe than would be meted out to them by the ordinary tourist. Thirty-seven miles in the hour over mountain roads—roads strewn with boulders and consisting of a wild succession of pot-holes and fly-crawls—is what more than one of the competing sidecars were called upon to do, and they stood the awful gruelling without so much as shaking loose a fitting. In fact, those that succumbed were extraordinarily few, and the breakages were in every case traceable to some acknowledged weakness in the design or workmanship.

It was noticeable that the passengers in the sidecar outfits complained of fatigue even more than the drivers—a condition of things that further strengthens the plea for spring sidecar wheels.

This Scottish test hill—Aultnaharie—conveys a slight idea of the state of some of the roads encountered during the recent Trials. These stretches approximate to Colonial conditions, and valuable data may be gathered during this strenuous test by manufacturers who cater for the Overseas market.

A Selection of Letters from Readers scattered all over the World.

Handle-bar Clutches.

New South Wales reader writes: "Please tell the ufacturer in England to fit handle-bar controlled clutches y time. Sometimes we have to negotiate stretches of l with steep banks upon which it is impossible to ride achine, and with a handle-bar clutch we can walk along , allowing the engine to do the work."

Advertisers and Prices.

Besquand," writing from Bombay, India, says: "May your columns, have a grouse that may eventually be a to others interested in the pastime. Why is it that ufacturers of electric lighting sets and electric conversion never publish in their advertisements the two details a most wishes to know, viz., *(a)* candle-power of bulb *(b)* approximate life of the dry battery (if this is to supply current)?

Why do some manufacturers of engines take the trouble t glass inspection windows to their crank cases so that oil level can 'be seen at a glance' when their booklets ot state what the level should be? Let us peep into one hese inspection windows, and what do we see? The oil l? Not a bit of it. A reflection of one's eye, or of the itry behind one's head is about all. Is the difficulty of g a sheet of bright metal a little distance from the inside of the glass insurmountable? The oil could be seen against the metal instanter.

"I notice several manufacturers still refuse to publish prices. Possibly all right for home customers, but hopeless from the Colonial customer's point of view."

Brakes.

"Colonial Engineer" discourses on braking systems in general: "As a Colonial engineer and a motor cycle rider of some eight years' experience it has been most disappointing to see the motor cycle industry (with one or two exceptions) back to their old slogan, 'What is good enough on a push cycle is good enough on a motor cycle.' I refer to the so-called 'new' (?) models which are being placed on the market.

"One of the principal things which I object to is the inefficient braking system adopted at present—a more or less efficient belt rim brake and a useless front rim brake. Now, sir, you may reply the front brake is never used. Perhaps not every day, but some day it will be wanted, and wanted badly. Some years ago, mounted on a first-grade English machine, I was descending a long steep hill, using my belt rim brake and compression. Half-way down the belt snapped, and I therefore applied the belt rim brake harder, and also the front rim brake. A hundred yards further down the hill the rubber came out of the shoe on the belt rim brake, leaving

Overseas Section.—

me at the mercy of the front brake, the Bowden wire of which snapped under the unusual strain. The nett result was one smashed machine and one smashed rider.

"Now, sir, with some few exceptions, the machines made in this country fit this useless front rim brake, which, besides being useless, scrapes off the enamel on the rims. Why do the manufacturers do it? Personally, I will never ride another machine unless it has band brakes.

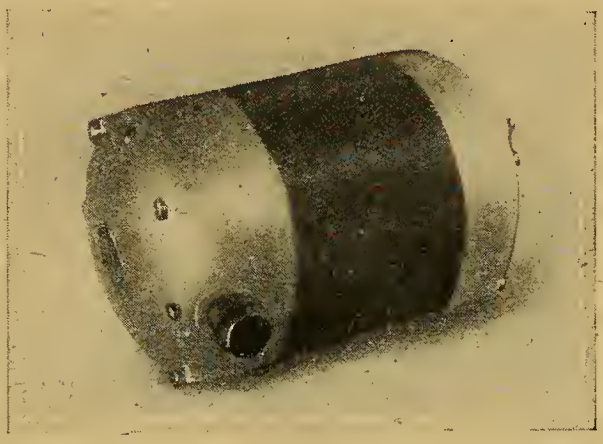
"Again, why do the manufacturers fit coiled springs to their forks? Any designer who knows the elements of mechanics must be aware that an undamped coil spring only slightly takes up the shock, and then tends to oscillate, whereas the fitting of leaf springs inherently damps these vibrations.

"Also, let us have no nickel, please. Enamel the machine all over. We wish to *ride* the motor cycle, *not* clean it all day, or have a rusty looking article. The control levers, clutch, and brake pedals, might be the same on all machines. One does not find a car with the clutch on the right and the brake on the left.

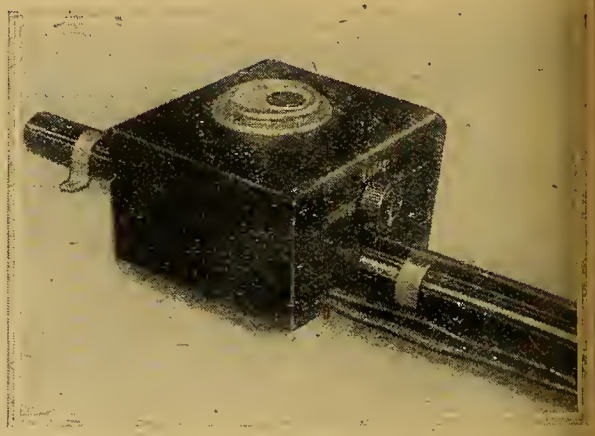
"In conclusion, one word to the motor industry. We prefer English machines to American, if suitable for our needs; but if you will not give us good brakes, springing, finish; and large wheels and rims, then the Americans will prosper in the Colonies as they did during the war."

A New Dynamo Lighting Set.

Electro-magnetic Cut-out: Illuminated Ammeter Dial: Tail-lamp Tell-tale: Dimming Arrangement for Lamps when Standing.



The 40 watt 8 volt "Perna" generator.



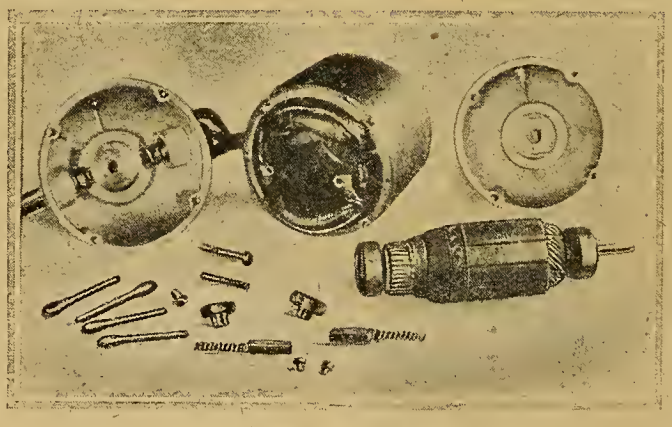
Switch box showing ammeter on the top

THE war has been responsible for the postponement of many designs of interest to motor cyclists; indeed, while much experimental work was undertaken as a result of the requirements of modern warfare, almost as many things were laid on one side for the same reason.

A device coming within the latter category is the Perna electric generator for motor cycles, which has been undergoing test privately since 1914, and in continuous use has proved to be thoroughly reliable.

The set consists of the dynamo, switchbox, accumulator, and the usual three lamps, and follows well-established practice in its constructional details.

Considering the generator first, the windings are arranged to give a continuous output of forty watts at eight volts, and will supply a constant current of one ampère above that taken by two thirty-two candle-power half-watt lamps and one four candle-power tail lamp when running at a normal speed of 3,000 r.p.m., and it is impossible to overcharge the batteries, no matter what speed is attained. The overall dimensions of this part of the unit are quite modest, being $4\frac{1}{16}$in. outside diameter × $5\frac{3}{4}$in. over the bearings.



The generator dismantled.

Fuller block accumulators are employed, and the wiring passes through a switch box arranged for mounting on the top tube of the motor cycle. The switch box has an ammeter in the top, easily visible while driving either by day or night, as when the lamps are switched on a small bulb beneath the dial, in circuit with the tail light, is illumined, thereby acting as a tell-tale for the latter.

Inside the switch box also is the electro-magnetic cut-out, which automatically breaks the circuit when the generator speed drops to 800 r.p.m., thus preventing the batteries discharging themselves through the dynamo when the voltage from the latter falls.

Another feature is the half-voltage device, whereby the lamps can be dimmed while the machine is stationary, or when riding through fog, where a yellow undazzling light is so necessary. By this arrangement only a quarter of the current is consumed, consequently a much smaller battery may be used.

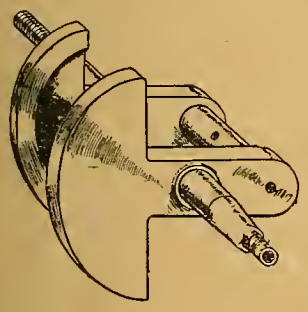
Mechanically, the construction of the whole outfit is on sound lines, the dynamo especially following car practice, the armature shaft being mounted on large double-row self-aligning bearings, and being driven by a $\frac{3}{8}$in. Whittle belt, or by chain as required. The weight is under 10 lb.

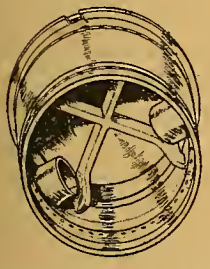
The makers, whose address is the Perna Engineering Works, Castlegate, South Shore, Blackpool, are listing the complete outfit at the moderate figure of eighteen guineas, and they may introduce a cheaper set for two lamps only.

A SPORTING SOLO SINGLE.

The "Buzmo"—a New "3½" with Overhead Valves, Outside Flywheel, and Mechanical Lubrication.

SINGLE-CYLINDER motor cycles of entirely new design are few and far between, and to learn of a new 3½ h.p. machine with an engine differing in many respects from general practice is always interesting. The machine to which we refer is the 3½ h.p. "Buzmo," which at no distant date is to be placed on the market by the Portable Tool and Engineering Co., Ltd., of Enfield Highway, N. Having a bore and stroke of 88.9 mm. and 76.2 mm. respectively, with 475 c.c. capacity, the cylinder is of cast iron, and fitted with a detachable head. The latter is hemispherical, and accommodates two tungsten steel valves, which are operated by rockers oscillating in bearings formed in two lugs on the cylinder head.

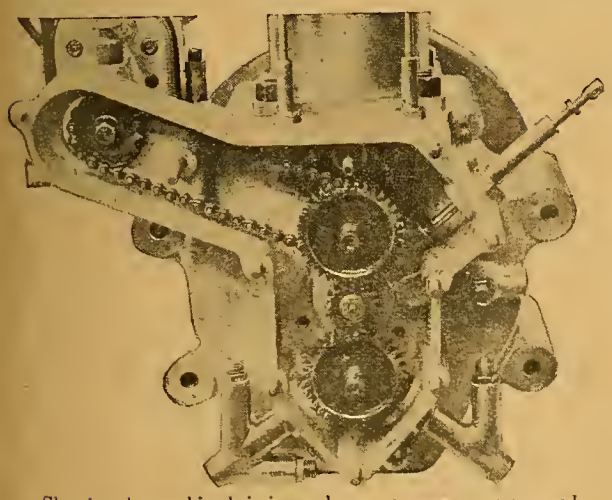




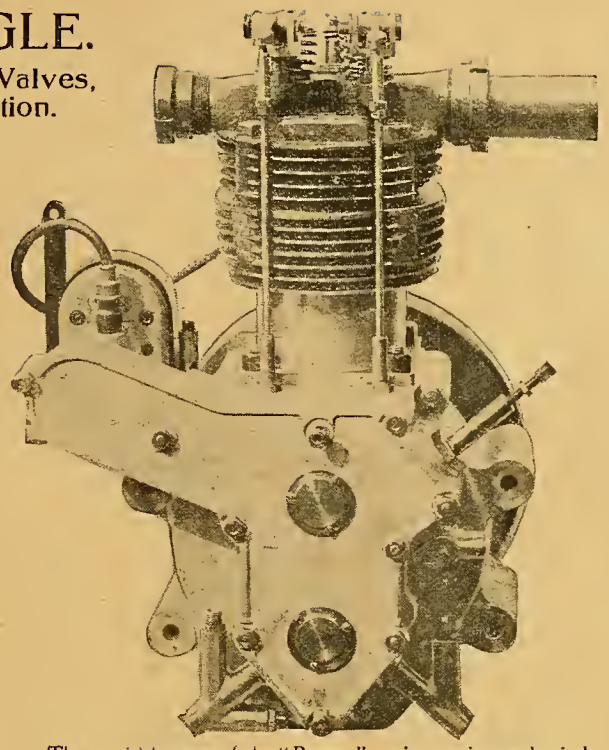
The milled and balanced crankshaft, and the cast aluminium piston, which has two unusually deep rings and two oil retaining grooves.

Two adjustable tappet rods transmit the lifting action from two rockers operated by a single cam wheel which is mounted above and meshes with the pinion on the engine shaft. Mounted on the cam wheel shaft is the chain sprocket which drives the C.A.V. magneto. The chain case is cast integral with the crank case. Below the main shaft pinion, and engaging with it on its under side, is another gear wheel of equal size, which is provided on the inner side with an eccentric on which ride two steel plungers operating two oil pumps. The function of these two pumps is to force the oil, contained in the front end of the large petrol tank, through various channels to the engine.

The oil passes down a pipe, coiled to offer a greater cooling surface, to one of the delivery pumps located at the front end of the timing gear case. This pump consists of a steel plunger reciprocating in a brass cylinder, its forward end resting on the eccentric, whilst the rear end rests against a steel return spring. Two brass pipes, provided with unions, are cast with the pump cylinder, each equipped with a ball valve, the seatings for which, however, are located on opposite sides to each other in order to operate the flow and return of the oil forced through the pump. The oil is forced by the pump to a channel in the crank case, which conducts it to the drilled crankshaft. Lubricating both the roller bearing on the pulley side and the plain bearing on the other side, the oil then passes to the big-end and is forced by centrifugal force up a pipe mounted on the connecting rod to the floating gudgeon pin bush and the gudgeon pin, and thence to the cylinder walls. The oil collected in the sump of the crank case is drawn through a pipe to the second pump, and is forced, through a sight-feed lubricator, back to the tank, providing a continuous flow of oil.



Showing the combined timing and magneto gear cover removed.



The special features of the "Buzmo" engine are its mechanical lubrication, outside flywheel, and overhead valves. The cylinder dimensions are 88·9 × 76·2 mm., giving 475 c.c.

An Aluminium Alloy Piston.

An aluminium alloy piston has two cast iron rings of unusual depth, and is provided with two annular slots around which a number of small holes are drilled. The edges of these slots, nearest to the centre of the piston, are cut at right angles, whilst the outer edges are bevelled; consequently, on the up and down strokes of the piston, oil is collected by these bevelled edges and contained in the slots, thereby distributing oil around the cylinder walls.

Fitted with the heavy pattern Druid spring forks, the frame departs somewhat from the conventional, the engine-supporting tubes being of the twin type. The wheels have knock-out spindles, and are, therefore, quickly detachable, while the rear wheel is equipped with an internal-expanding brake in the hub and also a shoe brake acting in the belt rim; both are heel-operated and Ferodo-lined.

Both front and rear mudguards are of ample width, and are fitted with side shields.

Negotiations for extensive premises are being made, and it is confidently anticipated that the machine will be produced in quantities early next year at a price between fifty and sixty guineas. A limited number, however, may be available before the end of this year. The "Buzmo" is designed as a simple solo single, and, as such, there should be a brisk demand for it on the part of those who desire a sporting machine for solo use.

DAY TRIPS and WEEK-ENDS

by

Chas. G. Harper

III.—OXFORD to FARINGDON, CIRENCESTER and CHELTENHAM

Previous instalments appeared in "The Motor Cycle" August 7th and 14th.

The old ruined abbey at Besselsleigh.

WE leave Oxford along the most uninteresting street in that city: Queen Street, which leads to the railway stations. It is almost inevitable, I suppose, that streets to railway stations should have that air of squalid modernity which is the mark of Queen Street, Oxford; but a very apt comparison comes at once to my mind: that with the Hills Road, Cambridge; which, although it is the way to the station, is a dignified, nay, almost a noble, street. However, I have not set out here to draw invidious distinctions. To Queen Street succeeds the long, straight length of the road past Botley: the "Seven Bridges Road." as Oxford men know it. At the fork we bear left and ascend to Cumnor, whose Norman church crests the hill. In it you will find the tomb of Anthony Forster, who died in 1572. He is commonly supposed to have had a hand in the mysterious death of the Countess of Leicester, Amy Robsart, who was found with a broken neck at the foot of a staircase in Cumnor Place. She stood in the way of her husband's ambition to marry Queen Elizabeth. Those were the times of an Italian Renaissance feeling in England, alike in art, architecture, crooked statesmanship, and lack of private morals. "An Italianate Englishman is the very devil," said some accurate observer; and the Earl of Leicester was that. A manuscript notice of the interesting things in Cumnor church concludes with the observation, "The future is not yet." This, it will be admitted, bears of no contradiction. It is the surest of things.

A Thames pastoral at Fairford.

Past a beautiful avenue, we have on the right the little church of Besselsleigh, and all that remains of the old manor house—a stone pillar of one of the entrance gates. Thus vanished the glory of the Besils and that of the Fettiplace family who succeeded them. Forward, past a junction of roads at the hamlet of Tubney, and through Fyfield and the quaintly-named Kingston Bagpuize, the road goes fairly level, and for nearly eight miles, into Faringdon, almost lonely, save for sight of the little hamlets and villages some distance off to the right. One of these, Buckland, four miles beyond Kingston Bagpuize, is interesting, alike for its church and the vastly lengthy mansion adjoining, once a seat of the Warwickshire Throckmortons, and before them of the Yate family, who have left as relic of their race a monument, dated 1648, to Sir Edward Yate and Lady Katherine.

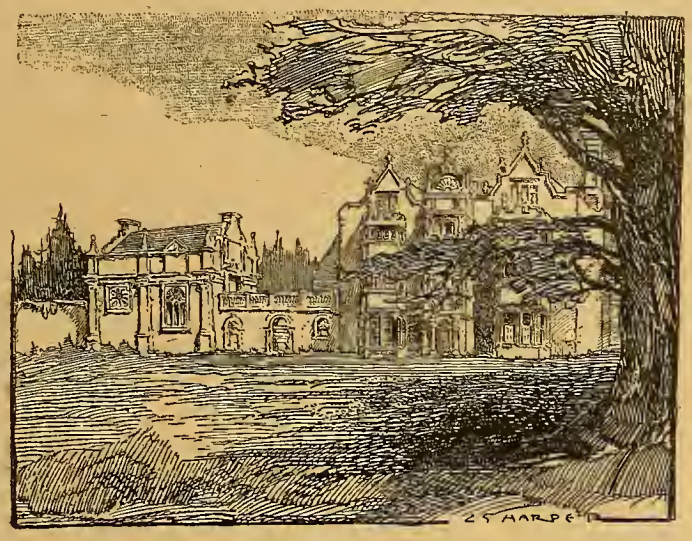
"The Baronet particularly honoured for
Morall, economical and prudential merit.
The ladie reverenced for
Sanctimonious zeal, humble and constant patience,
Abundant charitie, and admirable justice.
Reader! Depart! Imitate!"

We depart, but we cannot hope to compete.

Faringdon Clump, a landmark of trees on a hill to the left, is visible over many miles. The little town of Faringdon itself lies in a hollow; a decayed place with a market house missing its market and now housing the fire engine. At one end is a little lock-up, with the remains of a hand pillory outside, by which petty offenders were kept in durance, for the jeers of passers-by. The right-hand road from the Market Place is our way, and leads to Buscot, beside the Thames, which we cross to enter Lechlade, whose church spire is visible for miles. It is another of the little decayed towns of the upper Thames, with little life or interest in it. Four miles beyond comes Fairford, of much the same character, but with a church remarkable for its complete set of ancient stained glass windows. Church and windows alike were provided by John

Day Trips and Week-ends.—

Tame, 1498, and by his son, London merchants and natives of Fairford. The twenty-eight windows are of Flemish workmanship, and are famous; especially the great west window, displaying in vivid pictures the rewards of the blest and the torments of the lost souls. Horrific imps and devils are shown, taking great delight in the tormenting work. There are two or three especially engaging imps; one strawberry-coloured and covered all over with pips, who is beating a poor soul with a spikey iron ball at the end of a chain, seems to be really enjoying himself. And so also will the tourist who visits Fairford and studies this window.



Burford Priory, a fine old country seat.

Cirencester, in a further 8½ miles, is reached along a road of no remarkable features; villages lie a little way off, rather than upon it. At Poulton an ingenious blacksmith, it will be noticed, has made a wayside trophy out of some thousands of old horseshoes accumulated in his way of business. "Ciceter," as Shakespeare calls it, wears that air of aristocratic dignity which sits so splendidly upon nearly all such ancient stone-built towns; and its great church forms an effective centre, the lofty tower being the feature of the town. Now that everyone can read, it is only the very old-fashioned country folk and Lord Bathurst and his county circle who call the town "Ciceter." Everyone else styles it "Cirencester." Who is, or was, that siren (spelt with a "c") after whom the place was named? There never was one. You can take your choice of derivations; from the Roman "Corinium," or from the Saxon "Ceorn-ceaster," for in both of those names that of the river Churn is hidden. The town is situated on it. Near at hand are the villages of North and South Cerney, which take their name from the same source.

The Market House, Witney.

Our way out lies to the right, round by the church; a very narrow and obscure exit. In passing, notice how the ambitious builders who reared that mighty church tower in the first years of the sixteenth century, or, it may be, the last of the fifteenth, grew alarmed at their own daring, and, fearing lest the foundations should give way, propped up the great bulk with a buttress like a timber shore. Absolutely ugly and by no means architectural, it has at least saved the beautiful tower from collapse.

It is a long straight road that takes you towards Gloucester: ten miles of a forthright Roman way, with nothing in the style of villages to hinder full speed ahead. Thus we come to Birdlip, at the crest of the famous Birdlip Hill: that long, dangerously crooked descent into the vale of Gloucester. The tourist may, if he wishes, try it, and turn to right for Cheltenham down below; or he may take the right-hand turn at top of the hill, and so descend lengthily into Cheltenham that way, through Leckhampton: six miles.

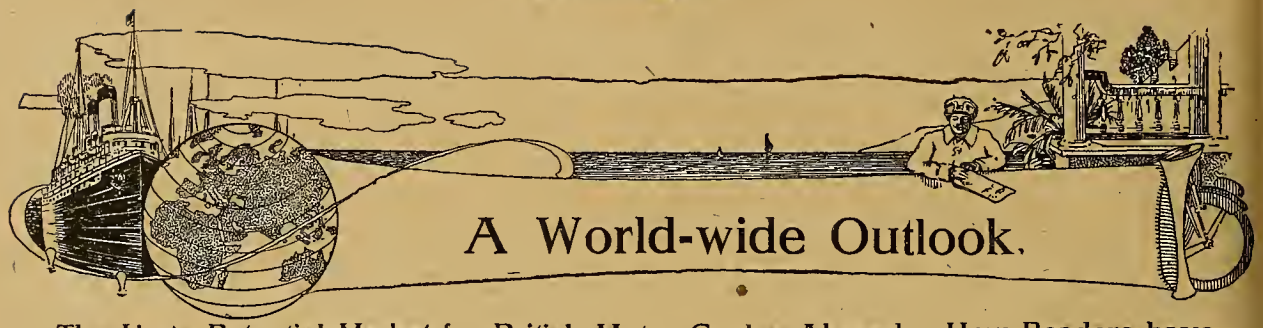
Rather than take the main road all the way home to Oxford, let us make a *détour*. Leaving Cheltenham past its suburb of Charlton Kings, and thence rising past the reservoir, we turn off to the right at Dowdeswell, coming in four miles to Withington. These are byways, and pleasant ones, leading through Chedworth Woods. At two miles beyond Withington, another byway leads on the right to the famous Roman villa discovered there, some fifty years ago. Straight ahead, the road goes on until it reaches the Fosse Way at Fosse Bridge. Here, turning left, and then right, we follow the winding valley road beside the river Coln, past Coln St. Denis, Coln Rogers, Winson, and Ablington, into Bibury, charmingly situated by the stream, with the lovely old-world hamlet of Arlington on the other side.

Our way to Burford lies past Aldsworth, three and a half miles, and six miles beyond. It is all rather grim Cotswold country, and, reaching Burford, we may be thankful for the homely welcome of that little town, lovely beyond compare, in its utter detachment from the life of to-day.

Burford owes a good deal of its quiet to being situated on a slip road just down below the great Oxford and Gloucester highway.

It is nineteen miles from here to Oxford through Witney. Having reached Oxford, we have compassed a circular tour of some ninety-seven miles.

(This series will be continued in subsequent issues.)



A World-wide Outlook.

The Huge Potential Market for British Motor Cycles Abroad. How Readers have Assisted "The Motor Cycle" Overseas Campaign.

CONSISTENTLY, and for several years, we have endeavoured to bring before British motor cycle manufacturers facts which would induce them to make strenuous efforts to capture the ever-increasing trade of the British Dominions and Colonies. Our campaign has been largely assisted by true Britons Overseas, whose informative communications have been published regularly. Useful suggestions as to improvements and modifications to existing British models, which have been considered by Overseas riders as essential to the full enjoyment of the pastime, have been widely read and studied.

British Overseas Models.

The fruit of that world-wide co-operation is seen in the 1919 Overseas models which several manufacturers have produced. Many of these models embody the most important of the improvements for which our Overseas readers have asked, as well as countless other modifications in construction which are the direct result of the manufacturers' experience with machines used under war conditions. These new Overseas models are fit and worthy representatives of the Mother Country. When once British manufacturers have got down to quantity production and lowered costs of manufacture, these models, quality for quality, will enable them to defy foreign competition in any part of the globe.

The question of price is just as important abroad as it is at home, and although British machines have had in the past, and still have, the benefit of preferential import duties in most of the British Dominions and Colonies, as well as the advantage of the Colonial buyer's natural leaning towards British articles, prices will have to be more on a level with those obtained for the American product, otherwise pockets will be considered before patriotism. Reduced prices are brought about by organisation and increased output. British makers are fully alive to that simple fact. The world's potential market for motor cycles has as yet barely been touched. The idea of the United States having five and a half million registered owners of motor cars in 1919 would have been ridiculed ten years ago, but it is now an accomplished fact, and we recommend British motor cycle manufacturers to think, if not in millions at present, at least in hundreds of thousands.

British Exports.

The number of motor cycles exported during 1913 from the United Kingdom to other parts of the British Empire was 11,302, valued at £500,768, and had not the war intervened the 1914 figures would have been much larger, but we want to see the figures increased tenfold before feeling satisfied that home manufacturers are even beginning to approach the position in the markets of the British Empire which they are rightly entitled to occupy.

New Zealand.

How popular the motor cycle has become in New Zealand is perhaps hardly realised by many. The climatic conditions of both islands are such that the pastime can be followed practically throughout the year. Many of the roads are as good as those in Europe, and seldom impossible for riding, but naturally all kinds of roads are to be found. During the six years ended 1917, New Zealand imported 13,606 motor cycles, or one for every eighty-one inhabitants, white and aboriginal—truly a remarkable proportion! Out of every hundred machines seventy-five were British, but this proportion has diminished greatly, for, while in 1913 the proportion of American machines imported as compared with British was as one is to twenty-five, in 1916 it had changed completely, British and American imports being practically equal, and in 1917 it was almost three to one against the British.

Australia.

Motor cycling has made very good progress in the Commonwealth, particularly in New South Wales, but the proportion is a good way behind that of New Zealand. One machine to every 224 inhabitants was the average in use throughout Australia in 1918. In 1917 America supplied 75% of the new motor cycles imported by Australia. In addition to the good roads in the principal cities of Australia and in the suburban areas of such cities, there are many thousands of miles of tracks on the natural surface providing good going, and to a large extent it is owing to this that motoring is becoming so general in Australia.

British South Africa.

This wealth-producing country easily heads the list of our Overseas Dominions so far as motor cycling is concerned. Figures for the five years ended 1917 show that motor cycles were imported into South Africa at the rate of one to every seventy-four of the white population. Our American friends have had a good picking of the South African market during the war, as their proportion of the trade in motor cycles and parts, which in 1913 was under 3%, rose steadily year by year and reached 54% in 1917.

AUTO-CYCLE UNION — R.A.C. ASSOCIATE

T. W. Loughborough, A.M.I.A.E., Secretary.

Are You Insured?

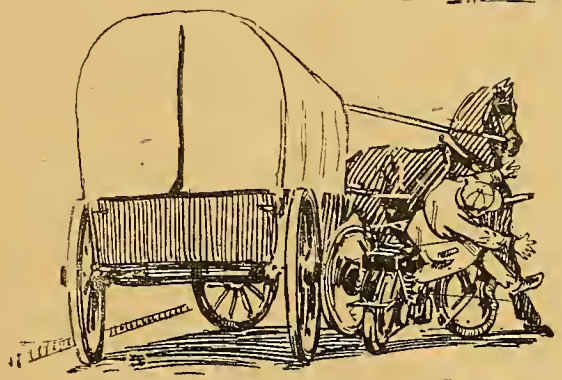
The mishaps that may overtake the most careful of motorists are numerous. It behoves every rider to insure both himself and his machine.

To encourage motor cyclists to take out a complete Policy under Table 3, such policy holders are admitted to full membership of the Auto-Cycle Union at one-half the usual subscription.

The A.C.U. Insurance Policy provides for every contingency, and its terms bring it within the reach of everyone who can run a motor cycle.

It is a straightforward contract, affording exceptionally generous benefits. Its conditions are stated clearly and without ambiguity; and you are invited to compare it in every particular with other policies.

The A.C.U. Policy is issued by the Law Accident Insurance Society, Ltd., a company of the highest standing; who have agreed that in the rare event of a dispute between themselves and a Member of the A.C.U., the decision of the A.C.U. Committee shall be final.



THE AUTO-CYCLE UNION,
83, PALL MALL, LONDON, S.W.1.

Telephone: Regent 5350.

The Secretary,
AUTO-CYCLE UNION
83, PALL-MALL,
LONDON, S.W.1.

Please send me further particulars regarding the advantages of becoming a member of the A.C.U. together with Application form for membership.

Name.....

Address.....

"The Motor Cycle," 28/8/19.

The TOURING G.N.

ENGINE.—The engine is the 90° air-cooled twin which has been fitted to the G.N. since 1912.

The G.N. engine is vibrationless, the running balance is superior to the balance of an ordinary four-cylinder engine.

Its two cylinders, 84×98, give a capacity of 1093 c.c., and the G.N. system of air-cooling, with deep cooling fins and arrangement of inlet and exhaust valves, gives excellent results. The engine is placed across the frame, and the cylinder heads and exhaust ports are very thoroughly cooled by the full and direct air draught.

A large external flywheel is fitted, and gives very steady running and slow pulling.

The rockers operating the overhead inlet valves are entirely enclosed in a neat casing, cast integral with the dome.

The cylinder heads are easily detachable, and their extreme accessibility enables carbon deposit to be removed in a few minutes.

LUBRICATION.—G. N. system of semi-automatic pump, delivering direct to crankshaft bearings, air-cooled sump to crank case.

TRANSMISSION. — Through 3-plate G.N. clutch to bevel-driven cross-shaft, thence by Renold roller chain to rear axle. Drive is taken through only one chain at once, and all changes are made by substantial hardened steel dog-clutches.

SPRINGS. — G.N. semi-cantilever springs with radius rods.

STEERING. — A neat steering gear box is fitted with bevel-gearing.

WHEELS. — G.N. detachable and interchangeable wire wheels, 650×65, with spare wheel and bracket.

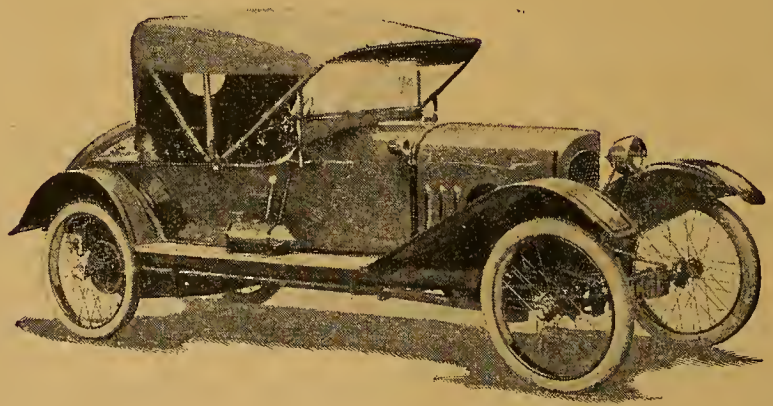
WHEELBASE.—Touring 8ft.6in., track 3ft. 6in., overall length 11ft., width 4ft. 2in., height 3ft. 4in., with screen 4ft. 1in. Ground clearance 9in. Weight Touring, 6½ cwt.

The Standard TOURING G.N. *With detachable interchangeable wheels, but not equipped with accessories - - - approximately* £140

Fully equipped with hood, screen, dynamo lighting set with head lamp, side and tail lamps, spare detachable wheel with tyre, horn, pump, tool kit, jack, and number plates approximately £167 10

G.N. LIMITED, ETNA WORKS, ALBERT ROAD, HENDON, N.W.4.

York and District Motor Club, 4th August. — York-Edinburgh and back (406 miles — 23 hours); 2 G.N.'s entered, Mr. G. Finch on a "Standard TOURING G.N." 1919, and Lt. T. Gilmore-Ellis on a Vitesse G.N. 1919, both qualified for the highest award (The Silver Victory Cup). Petrol Consumption: Standard TOURING, 62 m.p.g.; VITESSE, 75¾ m.p.g.



Raymond.

In answering this advertisement it is desirable to mention "The Motor Cycle."

A World-wide Outlook.—

India, Ceylon, and Malaya.

In these countries the demand for motor cycles comes not only from the white population, but also from the wealthy and educated natives, and represents a potential market of great value. Over a period of three years, from April, 1914, to March, 1917, British India imported 5,504 motor cycles, American machines making no headway until 1916-17, when 525 were imported as against eight in 1913-14. Nearly 190,000 miles of roads are maintained by public authorities throughout the country, a third of which are metalled and in fairly good condition.

The American share of the motor cycle imports into Ceylon jumped from just over 10% in 1915 to 60% in 1917.

There were 1,130 motor cycles in use in the Federated Malay States in 1916, which number has undoubtedly increased by now.

Canada.

From the point of view of numbers of motor cyclists, the Dominion of Canada is the most backward of all the daughters of Britain. Canada has some of the finest roads in the world, one motor car to every thirty inhabitants, but only one motor cycle to every 916! Here is a splendid opportunity for enterprise on the part of British manufacturers. There is no apparent reason why motor cycles should not become as popular as cars: on the contrary, many places are accessible to a motor cycle that a car could never reach owing to the width of track.
